Seventh, the application of a stop cock v, or its equivalent, with each hydrometer chamber so arranged, moved, turned, and worked by appropriate machinery as to keep secure and retain for a variable period of time a specimen of the liquid or spirits that are or may have been in the cistern.

Eighth, the application of cam wheels Y and Z, for the purpose of thus turning, working, and regulating the hydrometer chamber's stop cocks or valves v, constructed and acting substantially in the manner herein described and set forth.

Ninth, the combination and connection of this series of hydrometer chambers H, with the three-way cock C, or an equivalent valvular arrangement for regulating the ingress and egress of the spirits to and

from the meter, constructed substantially in the manner and for the purpose herein set forth.

Tenth, the application of the interrupted cog wheels c d, for the purpose of turning, regulating, and reversing the three-way valves as herein described and set forth.

Eleventh, the arrangement of two or more spirit meters with a corresponding number of cisterns each and all leading to the main pipe A, coming from the same still with a plain ordinary stop cock r and s, at a suitable and convenient place in each pipe, thus leading to the main pipe A, coming from the still as herein described and set forth.

Twelfth, the combination and connection with each other of the various parts of the machine herein described and claimed, constructed substantially in the manner and for the purpose herein set forth.

63,453.—JOSIAH J. ALLEN, Philadelphia, Pa.—*Material for Preventing Incrustation in Steam Boilers.*—April 2, 1867.—Petroleum or other hydro-carbon oil is used in boilers to prevent incrustation.

Claim.—The application to steam boilers in the manner described, or any equivalent to the same, of hydro-carbons, for the purpose specified.

63,454.—M. J. ALTHOUSE, Waupun, Wis.—*Pump Piston Packing.*—April 2, 1867.—Improvement on his patent, November 13, 1866. The expansible packing is composed of a ring of a soft substance, as leather or rubber, and interposed between and protected by sectional rings of a hard substance, as metal or wood; the rings occupy a peripheral chamber of the piston and expand together.

Claim.—First, providing for sustaining a leather, rubber, or other soft packing between expansible rings or segments so as to protect the exposed portions of the soft packing, substantially as described.

Second, the combination of the expansible hard metal or wood rings, and the rubber or other soft rings, all constructed and applied substantially in the manner and for the purpose herein described.

63,455.—SHERMAN E. ANTHONY, Stillwater, N. Y.—*Gate.*—April 2, 1867.—The gate slides longitudinally on a pivoted guide bar, which then oscillates on its central pivot to swing the gate 90°. A vertical bar on the gate collides with a stop rod on the post to limit the longitudinal motion of the gate.

Claim.—First, the hinge guide bars C, in combination with a sliding gate A, arranged to operate in the manner substantially as shown and described.

Second, the curved rod E, attached to the post B, the rod J, in the gate and the hinge d, when said parts are used in combination with a sliding gate A, arranged on a guide slat or bar C, substantially as and for the purpose specified.

63,456.—JOSEPH AYERS, Greenbush, N. Y.—*Sash Supporter.*—April 2, 1867.—A spring is attached to the vertical edge of the sash, and its free end engages indentations in the casing to maintain the sash in the required position.

Claim.—The spring attached to the edge of the sash and engaging in recesses in the casing, substantially as described and represented.

63,457.—ALONZO E. BAILEY, Middleville, N. Y., assignor to himself, W. W. MOSHER, and W. W. JACKSON, same place.—*Shifting Rail for Carriages.*—April 2, 1867.—The seat has pivots which form points of attachment for the "top" rail and the back rail, which are slipped thereon and secured by straps.

Claim.—The pivots B, back rail C, composed of one piece, and having pendent pieces, the lower ends of which fit over said pivots B, upon the back of the seat A; and the top rail D, composed of one piece and fitting over the pivots B, substantially as herein set forth for the purpose specified.

63,458.—FRANCIS BAKER, New York, N. Y.—*Carriage Step.*—April 2, 1867.—The steps fold together within a slide so as to slip into a transverse chamber in the floor, and unfold into effective position when drawn out. Spring catches hold the slide in either position.

Claim.—First, the combination with a carriage body of a series of steps whether more or less in number, when such steps can be folded up or together,

and the said body is suitably constructed to receive and hold the same, substantially as and for the purpose described.

Second, the spring catches H and J, whether used separately or together, substantially as described for the purpose specified.

63,459.—SAMUEL S. BARNABY, Chicago, Ill.—*Wrench.*—April 2, 1867.—The movable jaw is held in position by a sliding spring-plate on the inner end of the hollow sleeve, interlocking with the teeth of the bar.

Claim.—The movable jaw *l*, hollow sleeve *o*, spring plate *n*, spiral spring *y*, cam lever *w*, constructed, arranged and operating upon the bar *e*, substantially as and for the purpose herein set forth.

63,460.—Canceled.

63,461.—LEANDER W. BOYNTON, Hartford, Conn.—*Machine for Drying Cloth, &c.*—April 2, 1867.—The superabundant moisture in the cloth is converted in the superheated apartment into steam, which is carried off by the exhaust fan; the cloth next passes through the dry air chamber. The tentering frame is adjustable in width. Elastic cords, connecting the tenter-bars, adapt the machine to the drying of wool.

Claim.—First, the combination of the endless chains and the tenter hooks in a machine in which high steam is used, when the machine is constructed, combined, and fitted to produce the result, substantially as herein described and set forth.

Second, the combination of the apparatus for conveying the cloth to be dried with an apartment in which high steam is used, (where most of the moisture is converted into steam,) and an apartment supplied with dry air, (where the drying is completed,) when they are constructed and arranged substantially as herein described and set forth.

63,462.—LEANDER W. BOYNTON, Hartford, Conn.—*Dryer for Wool, &c.*—April 2, 1867.—The foraminous cylinder is charged with wool and rotated, superheated steam is admitted above and ejected by its own pressure toward the outlet, assisted by the blast produced by the peripheral fans; the moisture in the wool is thus evaporated and removed.

Claim.—The combination of the internal cylinder D and its wings or vanes *g g*, &c., with the eduction port B and the induction port C, when the whole is constructed and arranged and the cylinder D caused to revolve substantially as herein described and set forth.

63,463.—SAMUEL C. BROWN, Carlisle, Pa.—*Plaiting Attachment for Sewing Machines.*—April 2, 1867.—The plaiting devices are adjustably connected to the stationary arm of the machine and rest on the cloth plate. They are explained in the claims and illustration.

Claim.—First, the improved plaiter made with the combination and arrangement of the adjustable plates A and B, the adjustable gage I, and the stationary gage C, operating and connected with D, in the manner and for the purpose described in the foregoing specification.

Second, the adjustable parts L and F, and the rod H and plate E, operating as described, and connected adjustably to the sewing machine by means of the part G, in the manner and for the purpose described in the foregoing specification.

63,464.—FRANKLIN C. BROWNELL, East Orange, N. J.—*Seat or Shelf.*—April 2, 1867.—The board which forms a seat for the adjacent desk has lugs on the end, which occupy two sector recesses in the standard, and by being pushed into the occupancy of the notches maintain the board in its prone or elevated position.

Claim.—The standards C, with the recesses E E, and with or without the recesses H H, the arms L, and projections A, combined and arranged substantially as and for the purposes specified.

63,465.—E. BRUNSWICK, Chicago, Ill.—*Clamp for Leathering Billiard Cues.*—April 2, 1867.—The base of the cue rests on the platform, and the upper

end is received in the socket of the spring plunger, which holds the cue vertically.

Claim.—The clamp to leather the billiard cues, constructed and operating substantially in the manner herein described and specified.

63,466.—JOSEPH T. BRYAN, Lebanon, Ind.—*Gate Latch.*—April 2, 1867.—The gravitating latch is retracted as the gate shuts, by collision with an inclined edge on the keeper, into which it falls when the inclined plate is passed.

Claim.—The latch 1 and 2, and the connection of this latch 1 and 2 with the catch 5 and incline 6, all operating and arranged as described and for the purpose set forth.

63,467.—IRA D. BUSH, Detroit, Mich.—*Padlock.*—April 2, 1867.—The link slips in the case, both bows projecting, and has a gap at one side. One bow is hooked over the ring or staple of the object, and being retracted, is arrested by a stop, while the other end is engaged by the lock bolt.

Claim.—The combination of the sliding link bolt B, stop D, and locking bolt G, or their respective equivalents, when arranged together and operating substantially as and for the purpose described.

63,468.—EDWARD CARD, Providence, R. I.—*Clamp for Furnace Molds.*—April 2, 1867.—The ratchet arm is worked within the hollow arm by a cog wheel operated by a lever. Each arm has a hook on its outer end. The spring pawl engages the ratchet arm to keep it in position.

Claim.—The hollow arm, with a ratchet arm movable back and forth within by a cog wheel, in combination with a lever pawl to operate upon said ratchet; together forming a clamp for the uses and purposes for which clamps are used, and to which this may be adapted, shaped, and constructed, as herein described and set forth.

63,469.—CHARLES E. CASE, Xenia, Ohio.—*Steam Generator.*—April 2, 1867.—The steam generating vessel has a double shell of metal, with a mixture of asbestos and fire clay between the plates in the more exposed parts, and is suspended in the furnace. The water is introduced through a helical coil of pipe ending in a rose, whence it issues in jets and flashes into steam.

Claim.—First, the application to the exterior of steam generators of a coating composed of asbestos mixed with fire clay, and held in place by a metal covering, as herein shown and described.

Second, in combination with a generator, constructed as herein described, the coiled pipe B, terminating in the perforated nozzle C, all arranged to operate as set forth.

63,470.—HENRY F. CLARK, Poughkeepsie, N. Y.—*Dentists' Vulcanizing Flask.*—April 2, 1867.—The base piece of the mold has studs extending to the top of the closed flask. The parts of the flask have ears which embrace the studs. A groove on the inside of each lug receives a key, which clamps the ears together and secures the two sections.

Claim.—A dentist's vulcanizing flask, constructed substantially as herein shown and described, and with the parts secured and held together by keys, substantially as set forth.

63,471.—ROBERT J. CLAY, Greenpoint, N. Y., assignor to himself, JAMES T. HUSTED, ETENGER J. BURLING, and CORNELIUS CORSON.—*Machine for Burring Wool, Ginning Cotton, &c.*—April 2, 1867.—The gang of vertical saws, with carriers and cleaners, separate the wool from the burrs.

Claim.—First, in machinery for burring wool, ginning cotton, or other analogous purposes, a combination with a suitable feed and burr, or seed extractors or delivery device, of a gang of reciprocating blades, having saw-shaped teeth at their edges, for operation relatively to the feed, substantially as specified.

Second, the combination, in connection with a suitable feed, of a series of reciprocating blades, having teeth on their edges and working through ways or passages which pass the fiber but exclude the burrs, with a series of intermediately arranged rotary burr extractors, for operation together, as herein set forth.

Third, the toothed-shaped blades J, made of taper form in direction of their length, as described, in combination with a suitable feed and series of burr extractors, essentially as and for the purpose herein specified.

Fourth, in a gang of saw-shaped blades, operating as described, for the purposes set forth, constructing the teeth of said blades straight or shelving on their outer edges, and sharpened from their roots to their points on their outer or front faces, substantially as shown and described.

63,472.—HAMILTON CLIPP, Orange, Ind.—*Beehive*.—April 2, 1867.—A sliding feed trough is inserted between the interior boxes of the hive, a register slide temporarily closing the avenues thereto while changes are being made.

Claim.—The combination of the sliding feed troughs H with the interior boxes E and F of the hive, when said sliding troughs are constructed and arranged substantially as herein described and for the purpose set forth.

63,473.—DANIEL W. COLBURN, Loami, Ill.—*Sulky Plow*.—April 2, 1867.—The plow handles are on each side of the seat. The four ends of the beams are slung by chains, a shaft which is rotated connecting by engaging a pin in the rear frame.

Claim.—The combination and arrangement of the beams E, chains D, roller C, arm K, notched bar J, and standard I, substantially as described, for the purpose specified.

63,474.—JAMES CONNOLLY, Newburgh, N. Y.—*Tool for Upsetting Flanges*.—April 2, 1867.—The jaws clasp the edges of the metal in flanging, and by striking the hammer end the metal is bent.

Claim.—The tool aforesaid, for flanging as above described, and which will produce the intended effect.

63,475.—S. B. CONOVER, New York, N. Y.—*Potato Digger*.—April 2, 1867.—The shovel plow is attached to the supplementary frame, which is connected by rods to the bell crank levers above. The carrying wheel is placed on the incline, rising toward the rear. The upper surface is convex, and in front is on a level with the top of the plow. The circumferential portion is formed with curved slots for the passage of earth. The potatoes are guided between guards over the wheel, and falling on a shaking screen behind are delivered on the ground. Deflecting arms in front of the plow gather the vines.

Claim.—First, the combination of the carrying wheel D with the shovel plow C, each constructed substantially as herein set forth, for the purpose specified.

Second, the construction of the carrying wheel D, with curved slots or openings n', substantially as herein set forth, for the purpose specified.

Third, the combination of the guards or fenders F G with the carrying wheel D, substantially as herein set forth, for the purpose specified.

Fourth, the shaking screen E, arranged in relation with the carrying wheel D and shovel plow C, substantially as herein set forth, for the purpose specified.

Fifth, the arrangement of the deflecting arms I, in relation with the shovel plow C and carrying wheel D, substantially as herein set forth, for the purpose specified.

63,476.—S. B. CONOVER, New York, N. Y.—*Combined Cultivator and Planter*.—April 2, 1867.—The main frame is supported on the axle, and in turn supports the vertically adjustable frame which carries the shares or other tools. A lever on the main frame connects by bell crank and rods with the supplementary frame.

Claim.—First, the combination with the main frame A, supplemental frame D, and fixed ratchet bar F of the operating lever E, bell crank levers b, horizontal connecting rods c, and upright connecting rods d, substantially as herein set forth, for the purpose specified.

Second, the sliding rods or braces i, attached to the supplemental frame D, passing up through suitable holes or slots, either vertically or on an incline, in combination with the main frame A and operating parts above recited, substantially as herein set forth, for the purpose specified.

63,477.—J. W. CONWAY, Madison, Ind.—*Cotton and Hay Press*.—April 2, 1867; antedated March 21, 1867.—After the lid has been raised, the press filled, and the lid replaced, the system of toggle levers connected with the horizontally moving plunger is extended, and the other plunger raised by slacking the rope which permits the gravitation of its operating toggle levers. The movable head being fastened in place the follower is retracted by folding up its toggle levers; this action draws up the levers of the vertical follower, which is depressed thereby.

Claim.—Both pressing and compressing the bales in one press, when the followers act alternately, and by the same arrangement of leverage, but in reverse motions thereof, substantially as and for the purpose herein specified.

Also, the detached follower D, arranged and operating substantially as and for the purpose herein set forth.

Also, the system of six levers G H I J K and L, arranged and operating in combination with the sliding rack N, substantially as herein described.

Also, the combination of the lever system G H I J K and L, and the toggle lever and bar R S, through the medium of the rope T, substantially as herein specified.

63,478.—EDWARD A. COOPER, Lancaster, N. Y., assignor to himself and J. N. JOHNSON, same place.—*Harness Snap*.—April 2, 1867.—The spring is fastened to the lug on the hook, and is covered and guarded by a grooved tongue pivoted at the base of the hook.

Claim.—Securing the spring C to the main body of a harness snap, by means of the lug D, the thumb lever or tongue B, being made so as to shut over and inclose the lug, in the manner substantially as herein described.

63,479.—MARTIN COSGRO, Peoria, Ill.—*Grinding Mill*.—April 2, 1867.—The millstones are ventilated, while running, by hinged inclined wings upon the top of the runner, in connection with inclined wings upon the periphery of the stone.

Claim.—The millstones constructed with oblique top wings a, connected to oblique side wings b, and operating substantially as described, for the purpose specified.

63,480.—A. R. CRIFIELD, Lincoln, Ill.—*Lantern*.—April 2, 1867.—The air for support of combustion is drawn through a chamber surrounding the upper part of the chimney, and passes down through the tubular guards.

Claim.—First, a hot-air chamber above the glass globe or lantern case, in combination with an air pipe or pipes to conduct the heated air therefrom to the chamber in the base, from which the illuminating flame is fed with oxygen, substantially as and for the purpose described.

Second, so arranging the air-conducting pipes P P P as to serve the purpose of guards to the glass globe or lantern case, as well as that of conducting air to the lower air chamber, substantially as described.

63,481.—JAMES E. CRONK, Poughkeepsie, N. Y.—*Wrench*.—April 2, 1867.—The shanks have longitudinal movement to adjust the jaws by an eccentric disk, one turning in a recess of the other.

Claim.—The combination of the eccentric wheel G, the pin F, projecting from one part A of the wrench, and the recess or slot E in the other part A, substantially as shown.

63,482.—ALPHONSO DABB, Elizabethport, N. J.—*Picket for Fences and Walls*.—April 2, 1867.—An iron strip attached to the top of the fence has pointed and spiked pickets projected therefrom for additional security.

Claim.—As a new article of manufacture, a picketed strip made up of a wrought-iron bar or strip A, and malleable cast-iron pickets B, for use on walls or fences, substantially as specified.

63,483.—GEORGE S. DARLING, Bridgeport, Conn., and ELIAS HOWE, Jr., Fairfield, Conn.—*Sewing Machine*.—April 2, 1867.—The raising of the presser foot due to thick material moves the spring loop through which the thread passes, nearer to the staple to relieve the thread from tension. The thread controller

is automatically operated through a bell crank connected to the presser foot stem, to allow an additional supply of thread to the thicker parts of material sewn.

Claim.—First, the pin *f*, or its equivalent, projecting from or connecting with the bar or any other part of the presser foot, to act in combination with the take up *E*, substantially as and for the purpose described.

Second, the pivoted elbow lever *F*, operating in combination with the presser foot, substantially as described, for the purpose specified.

63,484.—ENOCH DARNELL, Fox, Ill.—*Salt and Preserving Meat, &c.*—April 2, 1867.—Explained by the claim.

Claim.—The mode of preserving salt meat, lard, butter, or other substances, by means of stone, brick, or concrete tubs built in a stone or brick walled cellar, substantially in the manner herein described and specified.

63,485.—GEORGE DECKMAN, Malvern, Ohio.—*Churn.*—April 2, 1867.—An improvement on his patent, July 31, 1866, (No. 56,728.) The cream receives from the rotary disks a motion transversely of the box and a swaying motion longitudinally of the box from the working of the churn.

Claim.—The combination of a series of double concave disks *L*, attached to a horizontal shaft *H*, with the box *A*, having rockers *F* attached to it, substantially as herein shown and described, and for the purpose set forth.

63,486.—HENRY DISSTON, Philadelphia, Pa.—*Saw.*—April 2, 1867.—The segmental shank of the tooth, when the point is presented forward, is passed laterally into the recess and turned in the groove of the blade to its usual position, in which it is maintained by rivets filling corresponding cavities in the blade and in the shank of the tooth. The edge of the segment has V-shaped projections and the socket a corresponding groove, which gives the tooth its lateral stability, aided by a similar projection on the curved rear portion of the tooth, which fits in a groove on a rounded seat on the edge of the blade.

Claim.—The lips *i* on the edge of the projection *d* of a saw tooth, or on the edge of the recess in the blade, in combination with a groove and recesses *m* in the projection or in the blade, substantially as specified.

63,487.—CHARLES DISSTON, Philadelphia, Pa.—*Manufacturing Saw Blades.*—April 2, 1867.—The blades are heated to redness in a bath made by melting together Turk's Island salt and prussiate of potash. They are then dipped into a bath of oil or water.

Claim.—A saw blade composed of tough wrought-iron or homogeneous or Bessemer steel, and having a hard, carbonized exterior surface.

63,488.—ROBERT E. DOWNIE and H. C. JOHNSON, Delavan, Wis.—*Washing Machine.*—April 2, 1867.—A series of rubbers attached to a pendulous frame move forth and back over stationary rollers, self-adjusting on eccentric shafts.

Claim.—First, the eccentric shafts *E E* employed for adjusting the vertical position of the roller frame *D D*, and resting upon the bottom of the tub so as to sustain the said frame at both ends, substantially as described and represented.

Second, in combination with the above the removable uprights *F F*, pendular bar *H*, and rubber *I*, all arranged in the manner and for the purpose specified.

63,489.—GEORGE DUNLOP, Brooklyn, N. Y.—*Lithographic Press.*—April 2, 1867.—The wetting roller is a foraminous tube covered with slightly porous material, and moistens the stone in advance of the inking rollers. In the return movement of the carriage this roller is automatically raised free of the stone. The carriage runs up the spring slide to carry the inking rollers above and in contact with the fountain rollers or cylinders. The sectionally divided inking roller receives ink from one similarly divided, and operates to darken, lighten, or change the tints on certain portions of the printed sheet. The sectional rollers may be used alone to print in colors.

Claim.—First, the movable carriage *A*, containing a wetting roller *a* and inking-in rollers *G H*, in com-

bination with the trip lever *e*, dog *f*, cam *f'*, and feed rollers *E*, constructed and operating substantially as and for the purpose described.

Second, the springs *g*, under the ends of the rail *C*, in combination with the carriage *A*, containing the inking-in rollers *G H*, and with the feed rollers *E F*, constructed and operating substantially as and for the purpose set forth.

63,490.—H. A. ENGELS, C. H. ENGELS, and JOHN WIELAND, San Francisco, Cal.—*Hot Air Furnace.*—April 2, 1867.—The fire has a sinuous, reverting, upward course, the divisions being partly formed of transverse tubes which open at their ends into the air chambers. The latter are on each side of the furnace, and the air passes in a general upward course from one to another by means of the transverse connecting pipes and the upper connecting chambers.

Claim.—The arrangement of the set of pipes *c i p l g* bolted and cemented together, and at the same time staying the side plates, the sections and the whole structure of the furnace by means of the grooved shoulders and flanges of said pipes, as shown in Figs. 5 and 6, in combination with the square tubes or drying chambers *r s*, substantially in the manner, for the purpose, and upon the principle as herein set forth.

63,491.—JAMES H. FERGUSON and HENRY W. LOVEJOY, New York, N. Y.—*Machine for Trimming Metals.*—April 2, 1867.—The plate is secured by clamps on a sliding carriage which moves in front of a revolving cutter head which trims the edge, and a stationary knife which planes off the burr.

Claim.—The clamps *D* and carriage *E*, in combination with the table *F*, cutter head *A* on the adjustable headstock *B*, and stationary knife *H*, all constructed and operating substantially as and for the purpose described.

63,492.—C. FLEMING FLACH, Call, Prussia.—*Extracting Silver from Argentiferous Lead Ore.*—April 2, 1867.—The ore is melted with zinc as heretofore practiced. The resulting alloys are permitted to stand in a kettle till the alloy of silver, lead, and zinc floats on top; this is skimmed off and melted in a blast furnace with clay, iron-stone, marl, dross, or other silicious flux. The impure lead remaining after taking off the silver alloy is purified from zinc by smelting with slag or other flux.

Claim.—Improvement in extracting the silver and treatment of the lead contained in argentiferous lead ore by the means of a blast furnace process, in a manner substantially as described above.

63,493.—ORLANDO V. FLORA, Madison, Ind., and JAMES S. BOGLE, Springfield, Ohio.—*Churn.*—April 2, 1867.—The rotary dashers on the horizontal shaft rotate between the transverse bars, a stream of air from a fan and refrigerating chamber modifying the temperature of the cream.

Claim.—The combination of the dasher *G G*, breaker slats *H H*, fan *N*, and ice box or chamber *S*, arranged and operating substantially as and for the purpose herein specified.

63,494.—JOHN G. FOLSOM, Winchendon, Mass., and W. C. ANDERSON, St. Louis, Mo.—*Treadle.*—April 2, 1867.—The balance wheel is secured by a clamp and sustaining plate to the table and connected by band to the machine. The treadle has a stirrup and band for the heel and the pitman is longitudinally adjustable.

Claim.—First, the adjustable shaft *b*, with the hinged stirrup *E* and band *F*, in combination with the driving wheel of a sewing machine or of any other small machine and with a suitable clamp *B*, constructed and operating substantially as and for the purpose set forth.

Second, the sustaining plate *b*, in combination with the machine *C*, clamp *B*, wheel *A*, shaft *b*, and stirrup *E*, all constructed and operating substantially as and for the purpose described.

63,495.—JAMES P. FORCE and WILLIAM W. EGNW, Jarvis, Ind.—*Weather Strip.*—April 2, 1867.—The rock shaft is rotated by the pressure of the door elevating the strip which is hinged to the threshold. The strip vibrates downward in the direction of the

opening door, and when elevated forms a valve to close the opening beneath the door.

Claim.—The bent rod E, hinged in the holdfast F, constructed and operating as described and represented.

63,496.—THOMAS W. FOX, New London, Conn.—*Apparatus for Expelling Water from the Holds of Vessels.*—April 2, 1867.—Improvement on his patent, June 12, 1866. The outer cylinder is elongated; a horizontal tube fitted to its side contains a valve opening toward the cylinder. Under some circumstances the interior cylinder acts as a valve to the opening in the outer one; the inner one is actuated by a rod.

Claim.—First, the combination of the valve with the cylindrical vacuum producer when they are constructed, arranged, and fitted for use substantially as herein described and set forth.

Second, the combination of the cylindrical vacuum producer with the elongated main cylinder when they are so constructed and fitted to each other that when the part K of the cylindrical vacuum producer is raised out of the water the part I will close the apertures C in the main cylinder, substantially as herein described and set forth.

Third, the combination of the cylindrical vacuum producer with the rod E and its collar and binding screw *m*, when they are so arranged and connected that the cylindrical vacuum producer may be raised or lowered by the rod E, and may be secured at any desired elevation by the collar and binding screw, or any other analogous device, substantially as herein described and set forth.

63,497.—CONRAD FRANK, Cincinnati, Ohio.—*Belt Rivet.*—April 2, 1867.—The screw and socket are correspondingly threaded and enter from opposite sides of the belt lap against which their heads rest.

Claim.—The combination of the internally threaded conical sleeve E, the screw F, and the two flange heads B C, all constructed as and for the purposes herein shown and described.

63,498.—H. P. GALLUP, Medina, Mich.—*Windmill.*—April 2, 1867; antedated March 21, 1867.—The inner wind wheel has a series of radial fans and is surrounded by a circular series of stationary blades which convey the wind to the wheel. Gates slide in vertical grooves between the chutes to regulate the area of the openings for the wind.

Claim.—First, the wind wheel C, with arms *e*², fitted in grooves constructed and arranged in the wind chamber, substantially as described and for the purpose set forth.

Second, the combination with the wind wheel C of the inclined wind passages D, substantially as described and for the purpose set forth.

Third, the combination with the air passages D of doors E, substantially as described and for the purpose set forth.

63,499.—ARNOLD GARTNER, New York, N. Y., assignor to himself and M. O. LUTGEN, same place.—*Machine for Cleaning Flax and Hemp.*—April 2, 1867.—The flax is fed over curved adjustable aprons which direct the dust downward and is subjected to the action of the radial flyers which are attached to the periphery of the foraminous cylinder and the beaters, which are similarly placed and hung upon guidegears, the end extension of the beaters covering the journal boxes.

Claim.—First, the drum A, provided with yielding beaters D and rigid flyers E, in combination with the adjustable curved aprons G extending from the rests F, substantially as and for the purpose set forth.

Second, the lips *c*, extending from the ends of the beaters D over the boxes *b*, substantially as and for the purpose described.

63,500.—CYRUS F. GILLETTE, Sparta, Wis.—*Bed Bottom.*—April 2, 1867.—The bed cord passes back and forth and then crosswise over a succession of pulleys which are journaled in the rails and the slats above them. The cord is tightened by a winch.

Claim.—A bed bottom having the cord passing around a series of pulleys *b b*, the arrangement of the slats B B placed above the pulleys, when in combination with the shaft C, as specified.

63,501.—JOHN W. GLASS, Richland, Ind.—*Corn Husker.*—April 2, 1867.—The U-shaped spring jaws are clamped by the hand, the thumb claw having a loop and being hinged to the bar so as to have an independent movement in grasping the husk.

Claim.—The bars A B, constructed as described, and provided with the hook D and rest C with plate *m*, leather *g*, and loop *d*, when constructed and used as and for the purposes herein fully set forth.

63,502.—SAMUEL J. GOODWIN, Rockton, Ill.—*Paint Mill.*—April 2, 1867.—The periphery of the disk below the grinding surface is beveled outwardly so as to prevent the paint being thrown off by the centrifugal force. The edge of the spring scraper laps upon and extends beneath the disk to remove the paint therefrom.

Claim.—The revolving grinding nut when constructed with a beveled rim at its lower portion, substantially as described.

63,503.—JAMES L. GRAY, Baltimore, Md., assignor to F. M. HAY, M. L. GRAY, and M. A. GRAY, same place.—*Die for Making Cans.*—April 2, 1867.—The dies and stamps are adapted for making grooved flanges upon each end of preserve cans. The cylindrical piece is treated by swages which by consecutive operations give the edge the form desired. When one end is formed it is set upon a ring to elevate the other edge for similar treatment.

Claim.—First, expanding dies A A', and stamp heads D D', constructed and operating substantially as described.

Second, the rings J, in connection with the expanding dies A A', substantially in the manner and for the purpose described.

63,504.—JAMES L. GRAY, Baltimore, Md., assignor to F. M. HAY, M. L. GRAY, and M. A. GRAY, same place.—*Soldering Machine.*—April 2, 1867.—The can is placed on a rotating table, a spring plunger resting on its lid. The tool is steadied by a holding socket, so as to present the point to the line of junction.

Claim.—A rotary bed B, in combination with a yielding holder *g*, or their equivalents, operating substantially as and for the purpose described.

Second, the spurs *h*, in connection with the yielding holder *g*, substantially as and for the purpose described.

Third, in combination with the rotary bed B, and yielding holder *g*, the soldering iron support, substantially as and for the purpose described.

Fourth, the within described machine for centering, supporting and rotating preserve cans, said machine having its parts constructed, arranged, and operated substantially as set forth.

63,505.—JAMES L. GRAY, Baltimore, Md., assignor to F. M. HAY, M. L. GRAY, and M. A. GRAY, same place.—*Preserve Can.*—April 2, 1867.—Explained by the claims and illustration.

Claim.—First, a preserve can, which has formed on its ends grooved flanges, the grooves of which are adapted for receiving the edges of the cap and bottom plates, and strengthening the ends of the can, substantially as described.

Second, a can which has one or both of its edges turned inward, and crimped so as to leave a V-shaped groove or grooves, substantially as and for the purposes described.

63,506.—HENRY GROSS and JESSE B. RUMSEY, Tiffin, Ohio.—*Flour Bolt.*—April 2, 1867.—As the reel revolves it is reciprocated horizontally by the disk cans on the axis and casing respectively, which move it in one direction, and by springs which produce the recoil. The revolution causes a hammer to strike the ribs of the reel with a regulated force.

Claim.—The cam wheels *a i* and spring *d*, or their equivalents, as arranged in combination with a bolt or rail, which vibrates upon its shaft, substantially as herein specified.

Second, the arrangement of the rod H, spring E, lover F and sleeve G, with the reel and its pins, substantially as and for the purpose specified.

63,507.—REMI GROTZ, Chicago, Ill.—*Bridge.*—April 2, 1867.—The gates are attached to vertical

hinged rods, moved by gearing from a horizontal shaft, which is rocked by an arm and weight to close the gates. A lip on the bridge presses down a catch, raises the weight, and by reverse action of the shafts opens the gates, and a catch on an arm arranged to be pressed back by the closed bridge, or thrown forward by a weight, holds or releases the arm, which actuates the shafts.

Claim.—First, the mechanical device, consisting of a combination of levers and weights, as described, said levers being connected with and acting upon the upright shafts, to which the gates or barriers and the lanterns are secured, the whole constructed and operating substantially as and in the manner herein described and specified.

Second, the lip at the curved end of the bridge, constructed and operating as described, in combination with the said mechanical device, as and for the purposes set forth.

63,508.—THEODOR GRUNDMANN, Milwaukee, Wis.—*Apparatus for Making Vinegar.*—April 2, 1867.—Improvement on his patent, September 11, 1866. The wash enters above and passes through a series of troughs, which communicate by pipes, and have alternating partitions, which give the wash a serpentine course. The vinegar is collected in a lower trough.

Claim.—The arrangement of a series of level troughs C, provided with holes *a*, through which the liquid to be acidified, and also a current of air is conducted, and provided further with plates *b b*, whereby the liquid is detained, and its course lengthened without interrupting the rapid current of air, all made and operating substantially as herein shown and described.

Also, the box B, wherein the aforesaid troughs are placed, said box being so arranged that it may be easily taken apart and put together, and being provided with holes *d* and *e* for creating a circulation of air, and with dampers *e* for regulating the same, all made and operating substantially as herein shown and described.

63,509.—A. W. HALL, New York, N. Y.—*Washing Machine.*—April 2, 1867.—The rotary cylinder has inward projections, and contains smooth pebbles, which in connection with the corrugations act upon the clothes.

Claim.—The tumbling box or cylinder A, constructed with a series of longitudinal corrugations on convex ribs, operating in combination with smooth stones or balls of other suitable material, substantially as herein set forth, for the purpose specified.

63,510.—DANIEL B. HALL, Bucksport, Me., assignor to himself and HOWARD TILDEN, Boston, Mass.—*Bag Tie.*—April 2, 1867.—The leather tie strap has a slot in one end, protected by plates; through these the other end of the strap is drawn, and the end again inserted in eyelets made in the strap.

Claim.—The bag tie constructed of the strap A, the plates B, or their equivalent, and provided with the openings *e e e e*, either with or without the eyelets, substantially as described, and to operate as set forth.

63,511.—DURELL HALL, New York, N. Y.—*Apparatus for Carburetting Gas and Air.*—April 2, 1867.—The carburetting chamber is surrounded by a water jacket, whose contents are heated by a boiler. The air is forced into the hydrocarbon liquid below the partition, and rises through a valve opening in said partition into the upper part of the vessel. From thence it escapes through a coiled condensing pipe, which conducts it to the gas holder.

Claim.—First, the coiled condensing pipe I, used in the gas chamber of the vessel A, and provided with a check valve, when used in combination with the pipe J, and the receiving tank K, as and for the purpose specified.

Second, the arrangement of the heater C, provided with pipes D and E, with the vessels A and B, the branching air pipe G and the supply pipe F, as and for the purpose specified.

Third, the arrangement of the receiving tank K, provided with its guide *e* and discharge pipe L, with the pipes J and I, as and for the purpose specified.

63,512.—SAMUEL HALLOCK, New York, N. Y.—*Surface Conductor for Electrotyping.*—April 2, 1867.—On the ordinary mold pan is a metallic frame, set upon projections, the parts being fastened together by clamps and cross-bars, to which a number of metallic arms are attached. Within the pan is the wax mold of a page of letter-press, which is covered with a thin coating of plumbago.

Claim.—A surface conductor for electrotyping, arranged and operating substantially as herein described.

63,513.—J. A. HAMANN, New York, N. Y.—*Watch Pendant Key.*—April 2, 1867.—The key is retained in the pendant by a spring catch, which enters a slot in the key, so elongated as to allow it sufficient movement to disengage the spring catch of the face cover.

Claim.—The pendant A, having secured to it the spring catch *a*, in combination with the key C and shouldered pin F, constructed and operated as described, for the purpose specified.

Second, the key C, with elongated notch *b*, in combination with the spring catch *a*, secured within the pendant A, substantially as described, for the purpose specified.

63,514.—J. H. HARRIS, Virginia, Ill.—*Car Coupling.*—April 2, 1867.—The link oscillates the cylinder in entering, and is held by a radial pin upon it. The ends of gravitating levers enter notches in the fixed disks of the cylinder to prevent its oscillation when coupled. The levers are raised for uncoupling by a crank connected to their inner ends.

Claim.—First, the crank shaft L, connected to the levers H H, for the purpose of elevating and lowering the bumper of a car, also to uncouple the same for the purposes and substantially as herein described.

Second, the cylinder E, provided with notches and pintles G G, the levers H H and crank shaft L, in combination with the bumper P, substantially as described.

63,515.—GEORGE W. HAWK, Chicago, Ill.—*Churn.*—April 2, 1867.—The dasher rod is moved vertically in guides, being clamped to a slide in a trammel on the face of a revolving disk wheel.

Claim.—The combination and arrangement of the churn A and its cover, the platform B, the bottoms or cams *a b*, the standard E, the crank F, wheel G, and transverse slotted bar J, when constructed and operating substantially as set forth.

63,516.—HENRY S. HEERMANCE, Claverack, N. Y.—*Wagon.*—April 2, 1867.—India-rubber strips are attached at the point of connection between the wagon body and the bolsters and standards to prevent jarring.

Claim.—First, the application of india-rubber between a wagon body and the cross-bars or bolsters upon which it rests, substantially as and for the purposes described.

Second, the application of india-rubber between the standards C C and a wagon body, substantially as and for the purposes described.

63,517.—HENRY S. HEERMANCE, Claverack, N. Y.—*Umbrella Supporter.*—April 2, 1867.—The umbrella is secured by a universal joint to the upper end of an adjustable staff. The staff is jointed, having a slotted sector and pivot, and below is attached by a tenon and mortise joint to the stand post on the seat. The joints are rigidified by screws.

Claim.—First, the combination of the clamp D, ball and socket joint *g c*, and standard or support A, in the construction of an umbrella support, substantially as and for the purpose set forth.

Second, the combination of the joints *j k* and the ball and socket joint *g c*, in an umbrella support, substantially as and for the purpose described.

Third, the combination of the joints *j k* and *m*, substantially in the manner and for the purpose described.

63,518.—THOMAS HOLT, Trieste, Austria.—*Steam Generator.*—April 2, 1867.—The inner wall of the annular water space is constructed of a column of annular plates with vertical flanges for attachment to

those above and below. The feed water passes up a vertical pipe within the fire and smoke space, and supplies the water through down-curved pipes proceeding radially from its top. This pipe has circumferential projections agreeing with the recesses of the smoke space.

Claim.—The hot-air chambers or sections C, inclosing the steam and water tube B, and inclosed within the boiler A, constructed and arranged as herein set forth, for the purpose specified.

63,519.—G. W. HORTON, Belvidere, Ill.—*Swift and Reel.*—April 2, 1867.—The four pivoted arms have toggle connection to a sliding plate on the fixed arms, and may be spread at an angle of 60° therefrom or folded thereto. The block is attachable to either a table or chair-back in a horizontal or vertical position.

Claim.—First, the construction and arrangement of the disk B B, pivoted to the block D, and having secured thereto the main bar C, on which works the slide d, connected to the arms A by the pivoted braces b, as herein set forth, for the purpose specified.

Second, in combination with the above, the indicating wheel E, as herein described.

63,520.—TRUMAN HOTCHKISS, Stratford, Conn., assignor to ALFRED B. ELY, Newton, Mass.—*Friction Wheel.*—April 2, 1867.—The loose collar has anti-friction wheels on radial axes, which act between a collar on the propeller shaft and a fixed plate traversed by said shaft. The object is an anti-friction bearing to take the end strain of the shaft.

Claim.—The loose collar and wheels, constructed and operating substantially as described.

63,521.—SWIFT MCG. HUNTER, Terryville, Conn.—*Machine for Coiling Springs.*—April 2, 1867.—The whole at one end of the blank is placed over the arbor pin and the arbor caused to rotate by throwing in the clutch connection of its shaft and driving pulley. The brake is depressed by a treadle to allow the movement of the clutch shaft, and a pin on the latter keeps it in the depressed position. The outer end of the spring operates a rock shaft to release the clutch shaft from its holding latch, when a spring throws out the clutch and puts on the brake to stop rotation.

Claim.—First, the upright arm e, with its holding pins m m, in connection with the rock shaft d, the latch b, and the spring c, arranged and operating as described, in combination with the sliding bar F, the shaft A, and the clutch E, substantially as herein set forth.

Second, the upright holding rod i, in combination with the spring k, the arm e, and the arbor n, arranged and operating substantially as herein described.

Third, the sliding bar F, in combination with the spring g, stud i, and brake f, and the brake wheel H on the driving shaft A, arranged and operating substantially as described.

63,522.—W. H. HUYCK, Chariton, Iowa.—*Sleigh.*—April 2, 1867.—The metallic knees are bent to brace them to the runners, and one section of the knee being shortened makes a shoulder on which the bench rests.

Claim.—The knees C, composed of two parts a a and secured together, one of the parts being bent in a horizontal position and the other part forming a shoulder upon which the beam D rests, as herein set forth, for the purpose specified.

63,523.—CALEB JACKSON, York, Ill.—*Machine for Shrinking Tyres.*—April 2, 1867.—The tire is clamped to the moving end blocks of the frame by corrugated cams, with its convex side resting upon the curved central plate. The end blocks are then approached to reduce the tire in length.

Claim.—An improved tire-shrinking machine, formed by the combination of the operating lever I, shaft H, and pivoted levers F with each other, with the stationary part A and movable parts B of the machine, substantially as herein shown and described and for the purpose set forth.

63,524.—JOHN V. JEPSON, Brooklyn, N. Y.—*Pipe Cutter.*—April 2, 1867.—The head has a fixed serrated clamp and a sliding corrugated cutter, which is advanced by the screw of the lever. The pipe is

held between the cutters and clamp and is cut by the revolution of the tool around it.

Claim.—The use of a scraper C, in combination with a cutter B, when the two are arranged in a tool to cut and scrape a pipe or tube, as set forth.

63,525.—AUGUSTINE JEWETT, Boston, Mass.—*Regulator for Watches.*—April 2, 1867.—The index finger enters one of a series of notches in a segmental plate concentric with its axis and adjustable by a set screw. The regulator pins are in a longitudinally adjustable plate.

Claim.—The notched index C, in combination with the regulator of a watch, when such index is arranged so as to slide or to be moved upon the bridge plate of the balance of the watch, substantially as described and for the purpose specified.

Also, the combination with the above of the set screw G, arranged and operating upon the index, substantially as and for the purpose described.

Also, the regulator pins a, when attached to the regulator arm, so as to be adjustable therein, substantially as and for the purpose described.

63,526.—WILSON L. JONES, Baldwin City, Kansas.—*Lifting Apparatus.*—April 2, 1867.—The lifting platform rack is engaged by a toothed cylinder, operated by a handspike, for which it has radial sockets. A detent pawl engages the teeth.

Claim.—The rack beam E, having platform D, operating in combination with the cog cylinder F, provided with a shiftable lever J, and detent K, substantially as described, for the purpose specified.

63,527.—WILLIAM A. JORDAN, New Orleans, La.—*Apparatus for Bleaching Cane Juice.*—April 2, 1867.—The juice from the rollers passes by a trough into the cylinder, in which is a revolving agitator consisting of a perforated cylinder with paddle wheels. At one side of the cylinder and communicating with it is a tank with a perforated cover, on which a stream of water is projected. The tank communicates with an oven containing sulphur, the vapor of which escapes into the tank, where it is purified by the water, and then passes into the cylinder, where it is mingled with the cane juice by means of the agitator.

Claim.—The purifying of sulphur gas through water, in the manner specified and shown, for the purpose of bleaching and clarifying cane juice in a thorough manner, by means of the improved perforated revolving cylinder, with paddles or buckets combined, inclosed in box F, in the manner herein described and shown by the accompanying drawings.

63,528.—STEPHEN K. KANE, Allegheny, Pa.—*Manufacture of Petroleum Soap.*—April 2, 1867.—Rosin is dissolved in petroleum or benzine, melted tallow added, and the mixture agitated till incorporated. The mass is saponified by lye, after which coloring matter and perfume may be added.

Claim.—The process of making soap combining petroleum or other hydro-carbon oil, benzine or other product of such oils with animal grease or fat, or vegetable oil, either with or without the admixture of rosin, so as to form a chemical union therewith before adding the lye for saponifying, substantially as hereinbefore described.

Also, the process of making soap by first dissolving rosin in hydro-carbon oil, benzine, or other fluid products of such oils; then mixing the solution with melted animal fat or grease, or vegetable oil, so as to form a chemical union therewith, and lastly, saponifying the mixture thus formed with lye, either with or without the application of heat, substantially as hereinbefore described.

63,529.—ANTON KEIL and JOHN TRESCH, New York, N. Y.—*Machine for Molding Pottery.*—April 2, 1867.—The flask is attached to a vertically sliding frame, and its charge is brought into contact with a revolving core. The flask is composed of a series of sections, which can be opened to remove the pot after molding. The bottom of the flask is also movable and is pressed up to facilitate the removal of the molded pot.

Claim.—First, the cam e on the shaft C, for the purpose of raising the plate g and flask D, substantially in the manner herein shown and described.

Second, the combination of the curved flange *N* on the plate *g* with the pin *f* on the crank *e*, for the purpose of gradually lowering the plate *g* and flask *D*, substantially in the manner herein shown and described.

Third, the construction of the flask *D* so that the plates *d'* may be spread apart or closed at will, substantially as and for the purpose herein shown and described.

Fourth, the plate *K'* on the pin *K*, in combination with the spiral spring and the spring catch *l*, for the purpose of raising the ready molded pot, substantially as herein shown and described.

Fifth, the manner of opening and closing the flask *D* by means of the ring *F* and catch *m'*, substantially as and for the purpose herein shown and described.

Sixth, the combination of the frame *A* so that one or more flasks and cores may be arranged thereon, substantially as and for the purposes herein shown and described.

63,530.—C. P. KELSEY, Livingstonville, N. Y.—*Grain Cradle*.—April 2, 1867.—The fingers of the cradle are longitudinally adjusted in their clasping sockets, which are connected by stay rods to the snath.

Claim.—The sockets *E*, applied to the fingers *C*, cross bars *D*, and braces *F*, for the purpose of rendering the fingers capable of a longitudinal adjustment, substantially as and for the purpose set forth.

63,531.—PATRICK KENNY, New York, N. Y.—*Shirt Studs*.—April 2, 1867.—Cross bars are imbedded in the disks and form points of attachment for the flexible loop which connects the disks.

Claim.—The perforated plates *A* and *B*, counter-sunk on opposite sides forming shoulders in the center of the plates on which bear pins *D*, around which the connecting loops *C* pass, holding the plates together with an unbroken flexible connection, in the manner described, for the purpose specified.

63,532.—CHARLES B. KNAPP, Waterloo, Wis.—*Boring Machine*.—April 2, 1867.—By means of the pawl &c., the wood is moved toward and from the auger, and receives an intermittent rectilinear feed, so as to present itself for a series of holes to be bored in succession at regular intervals.

Claim.—First, the pawl *N*, hung to the framework *A*, in connection with the ratchet teeth of the carriage *I*, and operating substantially as described for the purpose specified.

Second, the guide bar or rail *J*, arranged to slide at the front end of the carriage and operating in combination with the arm *Y*, of the framework *A*, substantially as and for the purpose specified.

63,533.—D. I. LANGWORTHY, Jamestown, N. Y.—*Piano Forte Mover*.—April 2, 1867.—The platform on which the piano rests is supported on hinged legs which are braced by stay rods when down, but are retained against the under side of the platform while the latter travels on rollers.

Claim.—The piano mover, consisting of the platform *A*, to whose under side the spring lever catches *E* are secured, and bearing the clamps *J*, and handles *I*, folding supporting frame *B*, provided with rollers *H*, and having the lower end of the stay rods *c* pivoted thereto, when all are constructed and operating as herein shown and described.

63,534.—C. G. LATHROP, SAN JOSÉ, Cal.—*Weed Cutter*.—April 2, 1867.—The V-shaped horizontal cutter has hooks on the ends of its wings, and is secured to a standard beneath the plow beam which is supported on wheels.

Claim.—First, a weed cutter made and operating substantially as herein shown and described.

Second, the V-shaped horizontal cutter *I*, provided with knives *K*, at its ends, substantially as and for the purposes herein shown and described.

Third, the circular revolving colter *G*, arranged in front of the plow beam in combination with the cutters *I* and *K*, all made and operating substantially as herein shown and described.

Fourth, the adjustable draft attachment *E* and *F*, in combination with the cutters *G* and *K*, as set forth.

Fifth, a weed cutter so constructed that either the knives or the wheels on which the whole device is

supported can be adjusted up and down so that the cutters can be brought more or less into the ground.

63,535.—G. LATTIN and A. F. HUBBELL, Coldwater, Mich.—*Seat for Vehicles*.—April 2, 1867.—The back is made from one board which is steamed and molded round a form to which it is confined by rods running through ear straps attached to the form. The angle of inclination is produced by cutting away a section of the wood so as to change the plane of the lower edge, and the upper edge is cut to correspond.

Claim.—The "bent reclining seat back" for vehicle seats, indicated at *T*, constructed and fashioned by the combined bending and reducing process, substantially as herein described and set forth.

63,536.—HORACE LITTLEFIELD, Lewis, Iowa.—*Scaffold*.—April 2, 1867.—Improvement on his patent, August 8, 1865. The scaffold is made in two sections, with a ladder and two extension legs to each, and when used in conjunction each section braces the other, enabling its use where attachment to the building is impossible, as in plastering.

Claim.—A portable scaffold that is made substantially as and for the purpose herein shown and described.

63,537.—T. A. LONG, Meadville, Pa.—*Soda Fountain*.—April 2, 1867.—The water, ice, and soda are placed in the reservoir, the liquid is forced thence by a pump into an air chamber, whence the soda is discharged by the compressed air into the glass which contains the acid.

Claim.—The arrangement of the pump *B*, the chamber *E*, the pipe *C* and *D*, constructed substantially as described, in combination with the casing *A*, for the purposes set forth.

63,538.—JOHN J. LOW, Cleveland, Ohio.—*Coal Stove*.—April 2, 1867.—The refractory lining has perforations leading to the annular chamber between it and the corrugated lining. The plate on which the fire pot rests is perforated to admit air between the fire lining and the outer casing, each side of the intermediate lining. The calorific current passes from the upper smoke chamber down side pipes to flues in the base of the stove, where it passes to the front and through the center to the exit flues.

Claim.—The corrugated or fluted cylinder *G*, as constructed and arranged in relation to the apertures *m m* at its base, and to the passages *n n* or *p*, substantially as and for the purposes herein specified.

Also, an interior perforated lining *H*, in combination with said corrugated or fluted cylinder, and aperture at its base, constructed and operating substantially as and for the purpose herein specified.

Also, in a cylinder coal-burning stove the passage of the products of combustion into the lower base *D*, at the sides thereof, thence forward under the hearth, and finally back through the middle of the base beneath the ash pan, to the exit flue or pipe, substantially as and for the purposes herein specified.

63,539.—JOHN J. LOW, Cleveland, Ohio.—*Coal Stove*.—April 2, 1867.—The annular air chamber between the fire pot and the casing has supply holes through its lower plate, and the upper portion of the fire pot is perforated to supply jets of hot air to support combustion.

Claim.—The perforated curved upper tier blocks *D D*, arranged in connection with the blocks *C C*, constructed as shown so as to form the air chamber *l l m*, substantially as and for the purposes herein specified.

Also, the arrangement and construction of the whole body of the stove lining *D C C*, in connection with the apertures *a* or *n*, in the manner and for the purposes herein set forth.

63,540.—JOHN K. LOWE, Cleveland, Ohio.—*Inking Apparatus for Printing Machines*.—April 2, 1867.—Sectional rollers are placed in accordance with the width of different colors to be printed. Small rollers dip into the fountains and impart their colors to the rollers with which they come in contact.

Claim.—The combination of the group of rollers *D C E*, and the group of rollers *G H I*, with the roller *F*, as and for the purpose specified.

63,541.—TINDAL A. MADISON, Terre Haute, Ind.—*Child's Carriage.*—April 2, 1867.—The revolving axle winds up an elastic cord so that when the carriage is moved to the limit of the cord it will return to the point from which it started.

Claim.—First, the combination of the revolving axle *a*, with the bolts *d d*, or their equivalents, for the purpose of alternately attaching the axle *a*, to the carriage wheels, causing them to revolve together and attaching the axle *a* to the side bar *c c*, causing the carriage wheel to revolve alone.

Second, the combination of the revolving axle *a*, the elastic cord *f f* and the friction pulley *g*, or their equivalents, for the purpose described. Also the combination of the axle *a* and the spring *n*, for the same purpose.

Third, the combination of the axle *a*, the regulating cord *i i*, and the friction pulley *m*, or their equivalents, acting in concert with the elastic cord *f f*, or the spring *n*, for the purpose described.

63,542.—TINDAL A. MADISON, Terre Haute, Ind.—*Plastering Trowel.*—April 2, 1867.—The brace holds the trowel at any given angle, and gages worked with thumb screws adjust the trowel to the desired thickness of the coat of plaster.

Claim.—First, the construction of a plasterer's trowel with the brace *b*, to hold the trowel to any given pitch or angle to the surface being covered.

Second, the combination of the gages *c* and thumb screws *d* with the trowel blade *a* and the brace *b*, to adjust the trowel to the putting on of the covering material of any thickness required.

63,543.—THOMAS MARSH, Central Falls, R. I., assignor to himself and D. L. FALES, same place.—*Device for Lubricating Spindles.*—April 2, 1867.—The journal sleeve has an oil cup attached by a pipe issuing horizontally therefrom above the surface of the oil. A wick conducts the oil to the spindle by capillary attraction, and its outer end lies in a groove of the sleeve.

Claim.—The oil reservoir *C*, and conducting tube *D*, distinct from the bolster in combination with a channel *a*, cut in the side of the spindle bearing and a suitable absorbent for conducting the lubricant, arranged substantially as described for the purposes specified.

63,544.—G. B. MASSEY, New York, N. Y.—*Boat Detaching Tackle.*—April 2, 1867.—The fall ropes are connected to blocks which pass through thwarts and have anti-friction rollers engaged by hooks on jointed levers. Connected together and operated simultaneously by a hand lever. The blocks go with the ropes when the hooks are disengaged.

Claim.—The vertical rods *C*, hinged to the boat at their lower end, and provided with the hooks *e*, at their upper ends, in combination with the blocks *D*, connecting bar *B*, and lever *L*, arranged to operate as herein shown and described.

63,545.—SILAS B. MALLSBY, Muncie, Ind.—*Sugar Juice Evaporator.*—April 2, 1867.—The pans are connected by overflow tubes; the lower section has an oscillating attachment to regulate the flow. The handle of the gate forms a clamp for the adjacent pan.

Claim.—First, the strainer gate *B*, constructed as herein described and represented, and employed to connect the pans together as well as to arrest the passage of the scum, as set forth.

Second, the adjustable elbow tube *C*, applied and operating in combination with the pans *A*, in the manner and for the purpose set forth.

63,546.—CHARLES E. McDONALD, Brooklyn, N. Y.—*Prop Stick for Piano Fortes.*—April 2, 1867.—Pivoted weights attached to the case drop on the lower ends of the pivoted props and elevate them when the main lid is raised. Catches withhold the weights while the lid is lowered.

Claim.—First, the combination with the hinged prop or props *C*, and lid or top *B*, of a weight or weights *D*, for action in the manner and for the purposes substantially as herein set forth.

Second, the combination with the hinged prop or props *C*, lid or top *B*, and weight or weights *D*, of a catch or catchers *E*, so constructed and applied as on closing the lid the weight or weights are automati-

cally released and left free to exercise a lifting action on the props, substantially as specified.

63,547.—WM. H. McDONALD, Brooklyn, N. Y.—*Piano Forte.*—April 2, 1867.—Elastic cords are attached to the pivoted props and are looped over pins prior to raising the main lid. On raising the lid the elasticity of the tightened cords draws the props into position to brace the lid. Stops prevent the props raising too high or lowering too far.

Claim.—The combination with the hinged or pivoted prop *C* to the lid *B*, of a spring or elevating device controlled by a spring and made capable of attachment to or detachment from the case for operation of the prop or props at either end of the latter, substantially as specified.

63,548.—S. MERRICK, New Brighton, Pa.—*Car Body Frame.*—April 2, 1867.—Angle iron is used in form of arched and angular trusses, girders and stanchions in combination with the usual beams and casing of the car, which has somewhat lighter proportions.

Claim.—In the construction of frames of car bodies the iron arched trusses *B*, the angle trusses *C*, and the horizontal iron plates *c*, in combination with the main sills *A*, the stanchions *a*, and the cross sills *d*, arranged substantially as and for the purposes herein described.

63,549.—S. S. MIDDLEBROOK, Sandy Hook, Conn.—*Hat Blocking Machine.*—April 2, 1867.—The levers are hinged in a plate pivoted at the head of a vertical shaft, and traverse the holes in a disk which is depressed by a treadle to expand the conic frustum formed by the upper end of the frame. A zone of rubber above the fulcrum contracts the frame on release of the treadle. The brim is rolled between corrugated conical rollers to stretch it. The crown part of the body upon the block is forced within a rubber ring, forming the angular connection between crown and brim.

Claim.—First, the construction and arrangement of the vertical shaft *A*, lever *D*, cross-head *C*, rubber ring *a*, perforated disk *F*, with its edge grooved to receive the metallic rod *d* surrounding said levers *D*, as herein set forth for the purpose specified.

Second, the conical corrugated rollers *G H*, the teeth of which mesh into each other, swinging frame *I*, bearing the oblique shaft *g*, and pivoted at its outer end *h* to the frame, adjusted by means of the set screw *i*, when constructed and arranged to operate as herein set forth for the purpose specified.

Third, the rubber ring *M* upon the table *L* of the frame *K*, sliding cross-head *l*, and block *N*, when constructed and arranged to operate as herein set forth.

63,550.—JOHN R. MOFFITT, Chelsea, Mass.—*Apparatus for Molding and Vulcanizing Articles of Rubber.*—April 2, 1867.—The rubber is placed in molds which revolve upon a cylinder and is compressed by steam-heated platens. The steam pipes are joined to allow a radial movement in the platens, which are raised on reaching their highest position by the projections on a slide actuated by a cam. Simultaneously with the rise of the platen the plunger bottom of the mold is raised to expel the rubber.

Claim.—The construction of the cylinder with a steam chamber, the outer surface of which is made capable of receiving molds or mold boxes of various sizes, substantially as set forth.

Also, combining with the cylinder the grooved wheels with swinging fellocs, and the groove ways in the upright, substantially as set forth.

Also, the employment of the friction rings or rolls running in the grooves, substantially as set forth.

Also, in combination with the mold cylinder and each mold thereof, the hollow steam-heated platen or follower.

Also, in combination with each platen or follower the bar *o*, having the mold blocks *z*, and the platen or follower connected therewith and operated thereby, substantially as set forth.

Also, the combination of the shafts *t w*, eccentrics *v* and lifters *r*, for raising the platen, substantially as described.

Also, combining with each hollow steam-heated platen or follower the jointed or movable steam pipe

for conducting steam into and from the platen, substantially as shown and described.

63,551.—CHARLES MORRIS, Stockton township, N. J., assignor to himself, GEORGE RICHARDS and STANLEY C. HYLTON, Philadelphia, Pa.—*Marking Attachment for Plows.*—April 2, 1867.—The jointed reversible bar is clamped onto the beam and has a trailing chain suspended from its further end for marking a line for a furrow.

Claim.—The combination and arrangement of the plow beam A, with the clamp B H, the jointed and reversible bar D K, and the chain M, operating substantially as described.

63,552.—DUNCAN MORRISON, Portland, Me.—*Combined Cane, Umbrella, Pistol, Dagger, and Camp Stool.*—April 2, 1867.—The umbrella is contained in the cane, and the seat in the umbrella. The pistol and dirk are contained in the top of the cane, which is separable from the rest.

Claim.—The combination and arrangement in the hollow of the top of the cane, of the pistol and dirk, operated and secured as described, with the umbrella and seat in the stock, the two parts of the cane being separable and capable of being united, all as and for the purposes set forth.

63,953.—ANSEL W. MUNROE, Rahway, N. J., and ISAAC C. MUNROE, Brooklyn, N. Y.—*Process of Enameling Hard Rubber, Gutta Percha, &c.*—April 2, 1867.—The rubber is coated with colored collodion to give the "gum color" to the rubber plates of the denture.

Claim.—Enameling rubber or its allied gums, substantially as described.

63,554.—HENRY NEUMEYER, Millerstown, Pa.—*Spiral Hay Fork.*—April 2, 1867.—As the vertical tines descend into the bunch of hay the spiral tines are rotated and then locked. The load being elevated the cord is pulled, disengaging the detent and revolving the spiral tines to discharge the load.

Claim.—The vertical tines A, shank B, roller or pulley D, and one or more spiral tines F, in combination with the rope E, support G, lever stop H, and spring I, substantially as described, for the purpose specified.

63,555.—G. C. PATTISON, Baltimore, Md., assignor to himself and BENJAMIN G. HARRIS, same place.—*Gaff for Ships' Spars.*—April 2, 1867.—The gaff has guard hooks or plates secured on either side to receive the gaff halyards and prevent their being caught between the gaff and the mast.

Claim.—Guard hooks or plates, combined with the inner end of gaffs or other swinging spars, substantially in the manner and for the purpose herein set forth.

63,556.—STARR POLLEY, Brooklyn, N. Y.—*Steaming on Hat Bodies.*—April 2, 1867.—The hat body is placed upon the pyramidal assemblage of levers, to which it is held by clamps with corrugated faces. The size of the frustum being then enlarged a hat block is elevated centrally, impinging against the crown and stretching the hat into shape.

Claim.—First, the levers B, standing in a conical or a pyramidal position during the stretching of the hat body, and provided with clamps for holding the body thereon, all constructed and arranged substantially as and for the purpose herein set forth.

Second, the longitudinal corrugations G* and B* in the acting faces of the lever and clamps of a hat-stretching machine, adapted to operate relatively to each other and to the hat body, as herein described and set forth.

Third, the spring connection m, arranged relatively to the clamps G and levers B and their connections, substantially as and for the purpose herein set forth.

Fourth, the carrier N N' and hat block O, operating relatively to the pyramidally arranged stretching levers B, which previously stretch the hat body, substantially as and for the purposes herein specified.

63,557.—NELSON PONTIUS, Hallsville, Ohio.—*Drilling Wells.*—April 2, 1867.—The outer end of the walking-beam has a ratchet wheel and two pawls, which latter are operated by lifting cams and give the

drill a rotary reciprocating motion. The clamping collar of the rope is supported upon arms rising from the ratchet wheel.

Claim.—First, the clamping arms or jaws I I, clamping the rope of drilling tools, in combination with the ratchet wheel F, with which said jaws turn, substantially as described.

Second, the combination of the pawls L L, the walking-beam, the horizontal ratchet wheel F, the cams Q Q for raising the pawls L above the ratchet wheel F automatically, and the slotted connecting rod, substantially as described.

Third, the vertical ratchet wheel M and its pawl, in combination with the slotted connecting rod O and cams Q Q, substantially as described.

Fourth, the orifice G through the ratchet wheel F, and through the bed plate E and walking-beam B, in combination with the hinged clamping arms or jaws I I, substantially as described.

63,558.—ARTHUR PRENTISS, Prentiss Vale, Pa.—*Spikes and Nails.*—April 2, 1867.—The spike has serrations on one side, and after being placed in the hole is forced laterally by a key so as to imbed the teeth in the wood and enable it to resist retractive force.

Claim.—Spikes and bolts for railroads and other purposes, whether round, square, octagonal or otherwise in form, constructed in two separate pieces, the one provided with roughened side or sides, substantially as described, and to be used conjointly either with or without the timber preservative, as and for the purposes set forth.

63,559.—GEORGE PYE and F. S. C. SOUTHER, South Boston, Mass.—*Machine for Cutting Corn Stalks, &c.*—April 2, 1867.—The two-wheeled carriage travels between the rows, and the knives which are set on the ends of the transversely reciprocating bars cut both rows. The knives are driven by wrist connections to crank wheels driven by pinions from geared rims on the driving wheels. The cutting apparatus rests on a castor wheel, the frame rocking upon the main axle as it undulates in conformity to the surface of the ground.

Claim.—First, the machine for cutting corn, cane, and other stalks, in the field, constructed, arranged, and operating substantially as herein described.

Second, the transverse sliding knives F F, operated by the cranks d d, in combination with the pinions g g, and the concentric toothed rims h h on the driving wheels A A, constructed and operating substantially as and for the purposes herein described.

Third, the rocking frame C C, and cross-bar E, in combination with the axle B, constructed and operating substantially as and for the purposes herein described.

63,560.—DAVID PYKE, Philadelphia, Pa.—*Balanced Slide Valve.*—April 2, 1867.—One section of the valve has a face working against the steam-chest cover, and the other, which is of smaller area than the former, works on the lower seat. These sections are held in their relative positions by a nut fitted to the valve rod and to recesses in the back of each of the sections. The sections are held apart and in contact with the seats by means of screw studs, with right and left-hand screw threads on them and nuts corresponding thereto.

Claim.—First, the adjustable valves D D', constructed as described, and the spindle E, with its nut t, the whole being arranged in respect to each other as specified.

Second, the combination of the two valves D and D', their studs or bolts m and m', those of one valve having left-handed and those of the other valve right-handed threads, and the nuts n having threads adapted to those of the said bolts or studs.

Third, the upper valve D and lower valve D', the former having a larger area than the latter when the two valves are used in connection with a cylinder having an valve chest on its side, as described, for the purpose specified.

63,561.—F. J. RABBETH, Iliou, N. Y., and J. E. ATWOOD, Williamantic, Conn.—*Self-oiling Spindle for Spinning Machines.*—April 2, 1867.—The oil cup is mounted on and surrounds the bolster extension of the spindle, which receives oil therefrom through a

slot. An aperture in the bottom of the cup carries down the oil within the bolster. A sleeve surrounds the oil cup, and the latter is fed through an opening in the former.

Claim.—First, the bolster, tube and step B B' B'', with an oil cup C at its upper end, provided with a passage a and slot c, the whole constructed as and for the purpose set forth.

Second, in combination with an oil cup mounted on or surrounding the bolster, the perforated whirr or whirr sleeve D', and outer perforated cap E for action, as specified.

Third, in combination with the spindle tube, the set screw F and packing k, operating to restrain the spindle to its place, and prevent the escape of oil, as herein specified.

63,562.—C. W. RHOADS, Indianapolis, Ind., assignor to himself, S. C. and E. O. FRANK and H. A. MOORE.—*Gate Latch.*—April 2, 1867.—The gravitating latch piece is entered from behind the holder before the latter is attached to the stile, and vibrates on its journals as it comes in contact with its keeper, or is raised by the finger to unlatch it.

Claim.—The combination of the several devices made, constructed and arranged, substantially as and for the purpose herein set forth.

63,563.—STEPHEN O. RIDER, New York, N. Y.—*Bale Tie.*—April 2, 1867.—One end of the hoop is looped around one bar of the buckle, and the other end is looped and protruded through a slit in the buckle, and engaged by a pin.

Claim.—The key or pin c, constructed with an annular tooth or rib c', in combination with the loop a' and slot c', arranged at the opposite ends of the tie or band, substantially as herein set forth for the purpose specified.

63,564.—PETER SHECKLER, Orangeville, Ill.—*Magazine Fire-arm.*—April 2, 1867.—The tube of the magazine and the rear chamber are filled with cartridges, the latter while the spring is temporarily retracted. The breech block is retracted by the oscillation of the trigger guard, and on the advance of the block the cartridge moves forward, and is received by the guides. Another motion of the guard draws the breech block from beneath the cartridge, the guide descends, the cartridge enters the bore, into which it is pushed by the retraction of the trigger guard.

Claim.—First, the slot n, in the rear of the stock for holding the spring plate E, for the purpose described as specified.

Second, the left-hand block T, in combination with the breech Q for operating the spring guides U, substantially as described for the purpose specified.

Third, the right-hand block T, in combination with the breech Q and hammer W, substantially as and for the purpose specified.

63,565.—JACOB A. SHERMAN, New York, N. Y.—*Truss.*—April 2, 1867.—At the side bend of the spring is a hinge and an adjustable slide to regulate the angle of the two portions, and thus adjust the force of the spring. The pad is pressed by a plate with radiating fingers, and is attached by a universal joint to the end of the spring.

Claim.—First, a truss spring, formed of two or more parts hinged together and retained at the desired angle to each other, substantially as specified, so as to regulate the pressure of the spring, as set forth.

Second, the ball joint i for attaching and adjusting the pad, in combination with the screw o passing through said ball, and taking the inner surface of the cavity as set forth.

Third, the plate m, formed with radiating levers or fingers, to which the padding is connected, so that they yield and adapt the pad to the surface of the hernia, as set forth.

63,566.—ELI SMITH, Claremont, N. H.—*Meat and Vegetable Chopper.*—April 2, 1867.—The side bars are slotted to hold a gang of knives, which have projections on their upper edges, against which the bars are expanded by the cross rod.

Claim.—The sides b b, as constructed, in combina-

tion with knives or choppers e e e, rod d and handle A, as and for the purpose set forth.

63,567.—GEORGE H. SMITH, New Orleans, La.—*Medical Compound.*—April 2, 1867.—For the cure of scrofula and pulmonary complaints, composed of laurus benzoin, 2 lbs.; bicarbonate of potash, $\frac{1}{2}$ lb.; the inner bark of cephalanthus occidentalis or button bush, 10 lbs.; white sugar, 72 lbs.; and water, 6 galls.

Claim.—The composition herein described, when the same is compounded of the ingredients herein specified in the proportions as given, for the purpose set forth.

63,568.—T. BRIGGS SMITH, Boston, Mass., assignor to himself and ELMER TOWNSEND, same place.—*Boot and Shoe.*—April 2, 1867.—Explained by the claim and illustration.

Claim.—A pegged boot or shoe, in which pegs formed from a twisted polygonal metallic wire, and of uniform size throughout their length, are substituted for wooden or other pegs heretofore employed.

63,569.—T. BRIGGS SMITH, Boston, Mass., assignor to himself and ELMER TOWNSEND, same place.—*Boot and Shoe.*—April 2, 1867.—Short pieces of twisted angular wire are substituted for shoe pegs.

Claim.—A peg or fastening of uniform size throughout its length, formed from twisted angular wire, substantially as hereinbefore described and shown.

63,570.—T. BRIGGS SMITH, Boston, Mass., assignor to himself and ELMER TOWNSEND, same place.—*Machine for Twisting Wire.*—April 2, 1867.—The wire is polygonal in form, is wound from a drum, passes through a die to a winding drum, which by the action of a spring keeps it at the proper tension, and winds it as fast as twisted. One wheel guides it through the die, and another draws it; the revolution of the frame is constant, and gives the twist. The variation in the twist is given by the rate of drawing.

Claim.—First, the adjustable die T, constructed and operating as described.

Second, the drawing wheel R, hung in the revolving frame K, and arranged and operated in the manner specified.

Third, the drum W, hung in the revolving frame K, and constructed and operating as set forth.

Fourth, the combination of worm wheel Y, operated as described, with shaft X, ratchet i and spring n, in the manner and for the purpose specified.

Fifth, an improved machine for imparting a regular and adjustable twist to wire constructed, arranged, and operating substantially in the manner described.

63,571.—MATHIAS SPENLI, Detroit, Mich.—*Wood Turning Lathe.*—April 2, 1867.—A right and left last are turned at the same time in the same lathe, and from a single pattern, which may be larger or smaller than the last produced. The cutter heads are traversed by the right and left-hand screws of the single spindle, so as to simultaneously advance or recede from the central wheel, which is actuated by the pattern last. By shifting the bolt in the slotted lever, the motion of the pattern wheel head can be accelerated or retarded to make the lasts respectively smaller or larger than the pattern, while preserving the relative proportion of the parts of each last.

Claim.—First, the arrangement of cutter heads F F', moving in opposite directions, in combination with the head H carrying the guide wheel, substantially as and for the purpose described.

Second, the vibrating slotted lever f and bolt e, in combination with the heads H F', so that the speed of the head H in relation to the heads F F' can be regulated for the purpose specified.

Third, connecting the oscillating spindle stock J, with the stirrup supporting the axle of the guide wheel, so that said guide wheel and spindle stock move simultaneously toward and from each other, as and for the purpose set forth.

Fourth, a lathe for turning lasts in which a right and left last are turned simultaneously from a single pattern, when constructed and operating substantially as described.

63,572.—A. T. STEARNS, Dorchester, Mass.—*Machine for Making Wooden Ease Troughs.*—April 2, 1867.—The machine has a cylindrical saw running

upon anti-friction rollers, an obliquely journaled scoring saw and finishing planing cutters.

Claim.—First, the arrangement upon the frame A of the cylindrical saw D, oblique saw H, molding cutters I J, cutters K L M, friction rollers C C and G G, substantially as herein set forth for the purpose specified.

Second, operating the hollow cylindrical saw D by means of driving belt D', extending from the drum on the shaft F around the said saw, holding it against the friction rollers G G, which form its bearings as herein shown and described.

63,573.—EDGAR M. STEVENS, Chelsea, Mass., assignor to ALFRED B. ELY, Newton, Mass.—*Heel Stiffener.*—April 2, 1867.—The outwardly rounded form obviates the wearing of the lining.

Claim.—A molded heel stiffening of rubber or similar elastic material having its upper edge turned over outwardly, as and for the purposes set forth.

63,574.—A. R. STEWART, Douglas Harbor Canning, New Brunswick.—*Wood Lathe for Turning Irregular Forms.*—April 2, 1867.—The arrangement of double carriages with the shafts and cutter wheels enables the use of several cutter wheels on the same blank. The two carriages are coupled by slotted plates, and are mutually advanced and reeded in conformity to the pattern between the traversers.

Claim.—First, the double carriage *f* and *f'*, with their shafts and cutter wheels and traversers, arranged and operated substantially as herein shown and described.

Second, the screw H, the clamp nut L and the swinging frame Fig. 5, in combination with the double carriage *f* and *f'*, operating substantially as herein shown and described and for the purposes set forth.

63,575.—EDGAR B. STOCKING, Binghamton, N. Y.—*Billiard Cue Tip and Fastener.*—April 2, 1867.—The tip embraces the head of a screw which has a square shank in the ferrule and a screw thread engaging a nut in the body of the cue.

Claim.—The combination of the slits in the underside of tips of rubber or leather, and a screw the head of which fits said slits and the body of which is square and fitting a ferrule movable and having a square opening in its center and acting as a wrench and a fixed nut in the billiard cue, as above described and for the above-named purpose.

63,576.—CHARLES STODDARD, Hancock, N. Y.—*Sleigh Runner.*—April 2, 1867.—The shoe has an upwardly projecting dovetail flange embraced between the lateral halves of the runner, which are bolted together.

Claim.—First, forming the sleigh runner in two parts A and B, with a dovetailed groove formed in and between them, substantially as herein shown and described and for the purpose set forth.

Second, forming the shoe C with a central projecting dovetailed flange *c'*, substantially as herein shown and described and for the purpose set forth.

63,577.—J. B. STODDARD, Baltimore, Md.—*Ice Boat.*—April 2, 1867.—The ram raises and breaks the ice which is deflected by the overhanging prow to keep it from coming on board. The serrated edges of the paddle wheels cut pointed projections of ice from the sides of the track.

Claim.—The arrangement of the projecting prow A and overhanging bow B, in combination with the paddle wheels with serrated peripheries, substantially as and for the purpose set forth.

63,578.—J. E. TABER, Fall River, Mass.—*Sink Trap.*—April 2, 1867.—The cone-shaped tube is divided longitudinally and hinged in such a manner that the parts open to afford a passage and close by gravity.

Claim.—The valve consisting of the two equally divided jaws B, forming a cone, their joint being at right angles with the top of the trap pivoted at their upper inner ends thereto, whereby they close by their own gravity, substantially as described for the purpose specified.

63,579.—WILLIAM A. TERRY, Prairie du Chien, Wis.—*Washing Machine.*—April 2, 1867.—The faces of the movable and under disks are respectively formed of corrugated sections. The upper receives the recip-

rocating rotary motion from a pinion and a master wheel, the latter oscillated in a vertical plane by a lever attached.

Claim.—The combination and arrangement of the lever K, gear wheel I, pinion wheel G, and vertical rubber shaft D, with each other with the supporting standard or frame F, and with the hinged part of the cover E, substantially as herein shown and described.

63,580.—AMALTHEA E. THORN, Fletcher, Ohio.—*Churn.*—April 2, 1867.—The churn has perforated partitions and valved air tubes, and is reciprocated bodily on wheels by pitman connection to a rotary crank.

Claim.—First, the churn barrel or chamber C, provided with the vertical perforated partitions G, in combination with the bed plate A, guide pins E E', pitman S, crank P, shaft *p*, and propelling handle *n*, or their mechanical equivalents, all arranged and operating substantially as herein described and for the purpose specified.

Second, the air valve or valves *k* in the tubes K K', or one of them, in the described combination with the elements of the preceding clause.

63,581.—E. W. TILTON, Oshkosh, Wis.—*Saw.*—April 2, 1867.—The saw plate has a transverse curvature to enable it to saw to a curved line.

Claim.—Forming a saw concave substantially in the manner herein shown and described, for the purposes specified.

63,582.—JACOB G. TROUT, Philadelphia, Pa.—*Burglar Alarm.*—April 2, 1867; antedated March 20, 1867.—The shaft is actuated by a spring and secured by wires to a door or window. The wire being freed, the spring throws the shaft down upon a percussion cap.

Claim.—The combination of body back and front F F, nipple *a*, rod or hammer and handle B b, spring C, right angle groove *l l*, screw *c*, and all as described and for the purpose set forth.

63,583.—JOHN VAN GAASBEEK, Mount Vernon, N. Y.—*Raising Bents in Buildings.*—April 2, 1867.—The plates of the hinge are attached to the sill and post respectively to guide the tenon into the mortise in raising the bent.

Claim.—First, the two-flanged plates A B pivoted together and furnished with suitable appliances whereby they may be attached to the post of a bent and to the sill, in the manner herein set forth for the purpose specified.

Second, the arrangement of the extremity *a* of the plate A, with reference to the inner surface of the plate B and of the flanged sides of said plates, that the said extremity and sides shall serve as guides for directing the tenon on the post into the mortise in the sill, substantially as set forth.

Third, the construction of the plate B with the slotted ear *d*, whereby the clamping chain F, or its equivalent, may be adjusted to clamp the plate B to posts of any desired size, substantially as herein set forth.

63,584.—H. F. WADHAMS, South Dansville, N. Y.—*Device for Gathering Apples.*—April 2, 1867.—The canvas pocket is attached to the tree by belts and its outer edge is secured to stakes by cords and rings.

Claim.—The canvas B secured to the body A of the tree to the medium of the belt A*, straps *a*, and secured or held in position by the stakes C D, all arranged in the manner substantially as and for the purpose set forth.

63,585.—EDGAR WAKEMAN, Brooklyn, Cal.—*Boat and Davit Tackle.*—April 2, 1867.—The lower davit block has a link somewhat like a lifting pin of a stone clevis and its enlarged end is kept in its recess by the curved wedge-shaped point of a horizontally vibrating lever. The levers at the opposite ends are connected by a rope to give simultaneous discharge.

Claim.—First, uniting the davit tackle to the boat by means of a hook link B, in combination with correspondingly-shaped hook strap or bracket C when said link or hook strap are jammed and held together by means of a cam or lever, substantially as described.

Second, uniting and detaching the boat to and from the davit tackle by means of a lever or cam in com-

bination with the hook link B and stop C, substantially as described.

63,586.—WILLIAM R. WALPOLE, Chicago, Ill., assignor to himself, WILLIAM G. WOOD, and JOHN G. WALKER, same place.—*Plow*.—April 2, 1867.—A vertical standard with subsiding share is attached to the beam behind the plow by adjustable bolted plates with a locking-cam attached. The standard is secured below by a slotted bar which is pivoted on the standard of the plow.

Claim.—The combination of the plates E and F, cam and handle K II, the standard D, shovel S, and rod c, arranged and operating substantially as and for the purposes specified.

63,587.—ZACHARIAH WALSH, Newark, N. J.—*Traveling Bag*.—April 2, 1867.—The edge of the bent strip clamps the material against the other portion of the frame; the recess to receive the hem is outside the rivets.

Claim.—The arrangement upon the frame a or the plate B, one or both, of a bent edge adapted to clamp the material at the point of its departure from the frame, the recess adapted to receive the hem being outside of the line of rivets, as herein described and represented.

63,588.—J. T. WARREN, Stafford, N. Y.—*Sad Iron*.—April 2, 1867.—The distance of the heating plug from the bottom of the iron is regulated by a set screw.

Claim.—First, the combination of the adjustable heating plug C with the hollow shell A, whereby the smoothing surface of the said shell may be heated to a greater or less degree by adjusting the plug at a greater or less distance from the bottom of the aforesaid shell, substantially as herein set forth.

Second, the thumbscrew b and supporting frame D, combined in relation with each other and with the handle B, heating plug C, and shell A, substantially as herein set forth for the purpose specified.

63,589.—WILLIAM WEAVER, Phoenixville, Pa.—*Composition for Destroying Insects*.—April 2, 1867.—Composed of air slacked lime, 14 parts; salt, 3; soda ash, 2, and sulphur, 1, mixed and scattered at the bases of trees.

Claim.—First, a composition of salt and soda ash to be applied to fruit trees, as and for the purpose set forth.

Second, the above composition in combination with slacked lime and sulphur, for the purpose specified.

63,590.—THEODORE A. WEBER, New York, N. Y.—*Safety Attachment for Pocket Books*.—April 2, 1867.—The hook on the book is impelled by a spring and released by a lever and is intended to penetrate the lining of the pocket to prevent the surreptitious abstraction of the book.

Claim.—The device for the purpose described consisting of a book b, spring d, lever c, and case B, in combination with the pocket book A, substantially as and for the purpose specified.

63,591.—J. A. WHITMAN, Auburn, Me.—*Oil Can*.—April 2, 1867.—Explained by the claim and illustration.

Claim.—The collar C, forming a cup upon the tube B at such a point near its upper end that the oil contained in said cup shall, when the oil can A is reversed, flow down the said tube and off its point without overflowing the said cup, as herein set forth.

63,592.—JONATHAN R. WHITTEMORE, Chicopee Falls, Mass.—*Sash Fastening*.—April 2, 1867.—The friction cam foot is pivoted midway of its length but eccentrically to the curve of the surface so as to bind the window in ascent or descent. This foot is pivoted on a slide plate worked longitudinally by a cam lever to throw the foot in or out of action. The device is attached to the sash and the foot acts on the strip.

Claim.—The cam H H H, slide C, and self-acting cam E and F, when used in combination substantially as described.

63,593.—JOHN WIARD, New Britain, Conn., assignor to A. E. TAYLOR, same place.—*Sash Fastener*.

—April 2, 1867.—The bolt in the sash which engages the stile has a pin entering a slot in the plate of the bolt which locks the sashes together; a retraction of the former bolt retracts the latter one, but a half projection of the former to engage the stile when the sash is open will not project the latter.

Claim.—First, the bolt a, provided with the pin d, sliding in the elbow-shaped slot g of bolt e, constructed and operating substantially as described, for the purpose specified.

Second, the elbow-shaped slot g of bolt e, through which slides the pin d of the bolt a, and operating in the manner described, for the purpose specified.

63,594.—SAMUEL P. WILLIAMS, Sheridan, N. Y.—*Fence*.—April 2, 1867.—Improvement on his patent, May 25, 1866. The rods have intertwined claws for attachment to the post, and have a girding plate with openings for the ends of the lower rails. The upper rails rest in an eye formed by a double oggee bend in the top of the wire. Intermediate girders form rests for other rails.

Claim.—In combination with the iron staple-shaped post, the ring or square-shaped fastening in the upper end of the post, as described.

Also, in combination with the post and ring in the same, the cross-bar and manner of fastening the same by means of hooks on the end of the cross-bar, as described.

Also, in combination with the post and ring, the cast or wrought-iron holder and brace, and the mode of receiving and holding the boards and rails therein, as described.

Also, in combination with the post and brace, the mode and manner of anchoring or fastening the foot of the post in the stone base by turning the end thereof, as described.

63,595.—SAMUEL RUSSEL WILMOT, Bridgeport, Conn.—*Steam Blower*.—April 2, 1867.—The blast pipe has annular concentric steam pipes within, having a double convex cross section and slits in their upper edges for the issue of the jets of steam which cause the blast.

Claim.—The steam jet, herein described, made of sheet metal and with small slits entering its cavity from the exterior edge of the jet, substantially as specified.

63,596.—GEORGE W. WILSON, Freeport, Ill.—*Churn*.—April 2, 1867.—The disk is attached to the rotary shaft, and triangular boards secured thereto form hollow dashers.

Claim.—The wheel E, provided with the triangular boards C C and D, whereby the chambers F are formed on each side of the wheel, substantially as and for the purpose specified.

63,597.—JAMES WINANS, Plymouth, Mich.—*Land Roller*.—April 2, 1867.—The two sections of the roller rotate in separate frames, which are pivoted to bars in front and rear to allow liberty of action.

Claim.—The two frames A A, connected together by means of the bars C C and bolts d d, which said bolts act as pivots for the frame, allowing them independent motion, substantially as specified.

63,598.—WALTER D. WOODS, Bennington, N. H., assignor to himself and EBENEZER F. WOODS, same place.—*Table Cutter*.—April 2, 1867.—A metal guard covers the edges and ends of the handle and forms a bolster to embrace the tang through which also it passes transversely.

Claim.—The combination of the blade, the wooden body B of the handle, and the metallic encompassing lining C cast on the tang a and the body B, in manner and so as to form the bolster, substantially as described.

Also, the extension of the bolster into and through the tang, when cast upon it and making part of a metallic lining to encompass the tang and the wooden body of the handle, as explained.

63,599.—JOHN E. WOOLLEN, Cressona, Pa.—*Sash Supporter*.—April 2, 1867.—The catch has a spring which tends to keep it extended. It has a lip for manipulation and a curved slot in its inner side traversed by a stop pin on the plate.

Claim.—The plate D attached to the sash, the pin E, arm F, and coiled spring *m*, in combination with the plate G and its projection *h* on the sash frame, the whole being constructed, arranged, and operating as and for the purpose herein set forth.

63,600.—JOHN E. WOOTEN and HENRY HAZEL, Cressona, Pa.—*Locomotive Attachment.*—April 2, 1867.—The ram is pivoted to the locomotive and may be folded against the same or extended by an adjustable spring-brace rod, to a position to engage a car on a side track to move it forward.

Claim.—First, the ram B, hinged to the bumper beam of a locomotive and arranged to operate substantially as and for the purpose herein set forth.

Second, the combination of the ram B, connecting rods C C', lever *f*, and vertical shaft D, the whole being arranged on a locomotive, substantially in the manner and for the purpose described.

Third, the said connecting rod made in two parts and connected together by a yielding coupling, all as set forth.

Fourth, the combination of the ram B and brace N with the pin *b*, by which the said ram is hinged to the locomotive.

63,601.—JOHN H. YAGER, Trenton, Ohio.—*Carriage Step.*—April 2, 1867.—The upper step is secured to the carriage by braces and stay rods. The stem of the descending under-step is sleeved in a tube attached to the back of the upper step and is secured in its upper position by a catch spring.

Claim.—The combination of the two step sections A and D, the one fixed and the other movable, when arranged together substantially as and for the purpose described.

63,602.—E. L. and W. R. YORKS, Honeoye Falls, N. Y.—*Water Elevator.*—April 2, 1867.—The ascending bucket, after having been automatically emptied, comes in contact with the shifting mechanism, which changes the clutch and reverses the motions of the drums to lower the empty bucket and to raise the other by a continued rotation of the winch in the same direction.

Claim.—First, the combination in water elevators of the double-acting levers E K, geared together and connected by any suitable spring arrangement, as herein set forth.

Second, the combination of the tension spring L with the double-acting levers E K, so arranged that the action of the spring is simply to expand and contract to operate the levers and to avoid friction, as specified.

Third, the screw blanks M, in combination with the spiral tension spring L, for compensating for the loss of elasticity, as set forth.

Fourth, the friction wheel N, combined with the levers K E, operating in the manner and for the purpose specified.

Fifth, the stops *k* k, combined with the levers E K and the clutch D, as set forth.

63,603.—H. L. ANDERSON, Smithville, Ind.—*Animal Trap.*—April 9, 1867.—A platform in the reversible wheel has a bait trigger whose motion draws the rod from its support, and the weight of the rat assisted by the weight of the end of the cord revolves the wheel and precipitates the rat into the chamber below; the wheel performs a semi-revolution, brings the opposite end of the platform in position, and the trap is reset.

Claim.—First, the revolving box, provided with two platforms so arranged that in each semi-revolution of the box an inverted action of the platforms takes place causing the trap to be again set in the same position as before.

Second, the employment of rod *s* and triggers *m*, so arranged that the animal in trapping himself forces said rod back, leaving it in position to reset the trap upon each semi-revolution of the box.

63,604.—O. W. BALDWIN and F. H. POPE, Greenfield, Ohio.—*Potato Digging Machine.*—April 9, 1867.—The potatoes are carried up the digger spout by the assistance of a rake, which is automatically drawn back on said spout and then raised and projected forward by the wrist pin of a crank entering a

vertical slot in the rake head. The potatoes pass from the spout to an endless transverse-slatted carrier, which is shaken by a pivoted lever engaged by a cam roller. The spout may be raised by a treadle.

Claim.—First, the concave digger, in combination with the rotating endless slatted apron or separator, all constructed and operating substantially as described.

Second, the rotating separator, in combination with the digger and shaker, all constructed, arranged and operating substantially as described.

Third, the slotted rake E, in combination with the digger, and the mechanism by which the peculiar motion of said rake is given to it, by means of the driving wheels.

Fourth, hinging the digger, the separator, and the shaker all upon one pivot at the rear, so that all may be elevated and depressed together, substantially as shown and described.

Fifth, the rock frame F, in combination with the digger, for the purpose of elevating and depressing the latter, substantially as described.

Sixth, in combination with rock frame F, for elevating and depressing the digger, a driver's seat so located that the driver can operate said frame by his feet, substantially as described.

63,605.—C. H. BALLARD, Worcester, Mass.—*Cartridge Ejector for Breech-loading Fire-arms.*—April 9, 1867.—The extractor is eccentrically pivoted, in relation to the barrel, so that the side vibration of the latter to expose the cartridge chamber will thrust out said extractor, which engages the flanged shell of the cartridge.

Claim.—The shell extractor consisting of one piece *c*, notched at its one end, substantially as specified, to gear with a fixed pin or stop *e*, and having its other end beveled, to cause it to protrude and recede by the swinging motion of the barrel on its pivot *a*, substantially as specified.

63,606.—WILLIAM A. BICKLE and ROBERT CHESTNUT, Richmond, Ind.—*Straw Cutter.*—April 9, 1867.

The feeding rollers are actuated by ratchets and draw-pawls, the latter connected to a bell-crank lever, which derives its motion from the cutting apparatus.

Claim.—First, the combination and arrangement, substantially as set forth, of the cutting and feeding mechanism of a straw cutter having a straight or curved serrated knife L and adjustable feed rollers C and C'.

Second, the combination of the shaft I, pitman H, T-formed lever G, and feed rods E and F, with the ratchet wheels D and D', substantially as and for the purpose set forth.

Third, the combination of the springs M, roller C, ratchet D, and feed rod F, hinged to the lever G, substantially as and for the purpose set forth.

63,607.—FRANKLIN H. BROWN, Chicago, Ill.—*Sewing Machine for Soling Boots and Shoes.*—April 9, 1867.—The guide passes over the edge of the sole; the awl makes the hole, and the punch forces down a double thread through a previously made perforation the tools being operated simultaneously by a hand lever. A steadying bar whose point enters the last made perforation rests on the leather between the awl and punch. The hooked spring lever draws out the thread under the punch preparatory to its being forced down. Springs restore the parts to their normal position on release of the lever.

Claim.—First, the combination of the punch *g* with the lever B, when constructed and operating to force the thread through the leather, after being paid out by said lever, substantially as and for the purpose set forth.

Second, the arrangement and combination of the lever B with the cylinder head G, spring *s*, and punch *g*, the whole operating substantially as set forth.

Third, the lever B, when applied and operating to pay out the thread as set forth.

Fourth, in combination with the lever B, applied and operated as and for the purpose set forth, the screw *l₂*, for adjusting its extent of vibration.

63,608.—J. S. BROWN and WM. FRANK BROWNE, Washington, D. C.—*Horse Hay Fork.*—April 9, 1867.—The main rod has an arrow head on whose barbs is

hitched the bight of the lifting rope. A tripping bar has a wedge which rises and spreads the bight so that it is freed from the barbs and falls.

Claim.—Sharpening the upper edges *ff* of the tripping bar in combination with the shoulders C C, substantially as described and for the purpose herein specified.

Also, the combined construction and arrangement of the hook B and pulley I, located in and closing the mouth of the hook, substantially as and for the purpose herein specified.

Also, the combination of the elevator substantially as herein described, and a noose band L, substantially as and for the purpose herein specified.

63,609.—JAMES B. CARYL, Candor, N. Y.—*Journal Box and Bearing.*—April 9, 1867.—The journal is surrounded by anti-friction rollers, and to prevent lateral friction balls are inclosed in the cavity between the inner shoulder of the journal box and the collar attached to the shaft.

Claim.—First, the journal box B, having the rollers R, arranged as shown in combination with the balls D, mounted in the ring H, and arranged to operate in the grooves in the end of the box and collar C, substantially as shown and described.

Second, providing the inner end of the box B with the circumferential groove *n*, and arranging the flange *t* of the collar C to project over the same, substantially as shown and described.

63,610.—RAINSFORD CANTELON, Montgomery, Ala.—*Plov.*—April 9, 1867.—The vertical circular frame has perforations for attaching the plow shank and beam in front, and the handles and adjusting arm behind. To the arm and shank are attached perforated curved bars, to which cultivator or harrow teeth can be bolted.

Claim.—The rim wheel A, constructed in the manner herein represented, or in any other manner substantially the same, when used with the necessary devices for forming a plow, as is herein specified.

63,611.—DEXTER H. CHAMBERLAIN, West Roxbury, Mass.—*Casting Type on Printing Wheels.*—April 9, 1867.—The mold plate has a central cavity for the reception of the type metal, and radial recesses for the mold sections. The faces of these sections are presented to the central cavity, and their rear ends held by segmental pieces which are backed by springs. A cover is placed over the whole, and has a mouth through which the metal is poured. For removing the type disk, the cover and the segmental ring are removed and the sections slid outward.

Claim.—First, the movable mold sections C, in combination with the mold block B, whereby impressions may be cast upon the perimeter of a circular disk or wheel or the surface of a cylinder, substantially as set forth.

Second, the mold block B, provided with recesses for the reception of the mold sections, substantially as specified.

Third, confining the mold section in place by means of a divided ring, in combination with a spring or springs, as and for the purpose specified.

63,612.—ALBERT F. CHANDLER, Winthrop, Me.—*Machine for Digging Potatoes.*—April 9, 1867.—The inclined tubular chute has a flat plowshare attached below to lift and guide the potatoes, and for supporting and guiding the machine. A bailed grid is hinged behind the chute, and is engaged and operated by the rod, crank, and beveled pinion, the latter meshing into the beveled gear on the inner face of the driving wheel. The depth is regulated by the adjustable standard of the driving wheel.

Claim.—The improved machine for digging potatoes, consisting of the chute B, with its plowshare or pointer and the sifter or grid *c*, applied to the beam A, and operated by the mechanism before described, consisting of the shaft D, beveled pinion and gear hand E, and driving wheel F, substantially in manner and to operate as before described.

Also, applying the adjustable standards or bearings *g* and *f* to the beam A, in manner and for the purpose essentially as set forth.

Also, combining with the beam A, the tubular chute B, as and for the purpose as explained.

63,613.—STEPHEN CHESTER, New York, N. Y.—*Connecting Telegraph Stations.*—April 9, 1867.—The separate lines of telegraph are connected each to the positive and negative pole of separate batteries, to the other pole of each of which another line is connected so as to make a continued circuit through all the lines and all the batteries. Each line is also connected to a magnet, and that line being broken an armature springs outward therefrom to a metallic block, and through the medium of a wire connection from the armature and block, completes the circuit through the unbroken lines without the intervention of the other. On the repair of broken lines, the armatures will be drawn from the blocks, and the circuit again established through the said lines.

Claim.—First, the arrangement of several telegraph lines, each in connection with magnets and batteries, and converging to a common center, by which the several lines and several batteries may be united as one line and one battery, or as distinct lines and distinct batteries, or combinations thereof, by the operation of any one or more of said lines without the presence of any one to control or direct the movements at the common center, substantially as described.

Second, the application of such connectors that when one or more of several lines forming one line or circuit has been cut out of the general circuit by reason of breaks existing, and a new circuit embracing the remaining lines has been formed, said broken lines being restored to continuity in themselves, will instantly resume their normal position in the general circuit without disturbing the normal condition of the remainder of the lines and without the presence of any one at the point where the several lines are connected together to direct or control the movements.

63,614.—GILBERT H. CLEMENS, Cincinnati, Ohio, assignor to himself and JOHN C. CRANE, same place.—*Head Block for Saw Mills.*—April 9, 1867.—The upper saw is supported on a hinged frame to allow its adjustment by spur wheels on its front pivot shaft, which engage vertical racks. The arbor of this saw has a V-shaped collar entering a fitting groove in the cap, and an elongated groove in the lower portion of the box to admit of longitudinal adjustment by sliding the cap. Rollers with left-hand screw threads and conical ends engage the upper edge of the advancing board to draw it from the saw, and tend to press the log from the saw in gigng back. This lateral movement of the carriage is also assisted by the inclination of the teeth of its driving pinion and rack. The feed motion is communicated by a friction pulley rotated by a belt from the main shaft. The said pulley is brought in contact with either of two other pulleys to cause a forward feed or an accelerated backward gigng of the carriage. The side pieces of the carriage are formed of tubular sections, connected by bolts and having the wheels journaled in them on tubular axes, which connect with oil receivers. The head blocks are tubular in the main, with the flanged end supports for attachment to the frame, and have a longitudinal opening traversed by the downward projection of the dog frame, which projection has a screw-threaded hole to engage the screw rod from which the frames receive lateral motion. These frames have a pivoted knee, one arm of which is adjustable in a tubular arc arising from the base piece, and have sockets to receive anti-friction rollers to receive the impact of the log. The lateral movement is given to the log by a tappet on a slide bar on the carriage, which is brought against a fixed projection, and which turns the screw rods within the tubular head blocks by pawls and ratchet wheels upon the rods.

Claim.—First, the manner of constructing, supporting, and adjusting the upper saw of a circular saw mill by the use of a hinged frame L N, pinions H H', racks G G', and nuts J J', as also the use of the set screws P P', in combination with the above, and for the purposes set forth.

Second, the upper saw arbor, provided with a single V-shaped collar *d*, in combination with the recesses *d'* *d''*, in both the bearing and cap.

Third, the use of the oblique teeth, in combination with the construction of a rack and pinion for the specified purpose of circular saw mills only.

Fourth, the bearing rollers 2 2', formed with conical ends and screw-thread periphery in part only, for the specified uses herein mentioned.

Fifth, the roller housing 3, as constructed in combination with the rod, making part of mill frame, as also the set screws 4, all to operate in the manner and for the purposes set forth.

Sixth, the vertical vibrating frame V, lever Z, pivoted to the bridge U, as also the pulleys W W' and pulleys S s and T, all in combination with each other, for the purpose of feeding and reversing the log carriage, as explained.

Seventh, the log-carriage side, formed of the metal tubular couplings 7, as also the cylindrical sections of timber 6, united together by a series of bolts 13 and eyes 14, the tubular couplings constituting the housings for the supporting truck wheels, substantially as described.

Eighth, the construction and application of the perforated tubular axle 10, oil feeder 11, and supporting wheel 8, all in combination with each other, substantially as described.

Ninth, the tubular form of head blocks 16 16', when provided with the partially concave flanged supports 17 underneath, and the V-shaped projections 18, and continuous slot on top, as also a series of indentations upon one or both sides of the same, constructed in combination with each other, and for the purposes set forth.

Tenth, the adjustable knee 20 and circular arc 21, when hinged to the base 19, and guided by the counter arc 22, and held in position by the pin 23, and provided with anti-friction rollers to operate in conjunction with each other, for the purposes as substantially described.

Eleventh, the combined arrangement of the setting screw 28, ratchet wheels 30, pawls 31, lever 32, counterbalances 34 35, and connecting rod 33, constructed and operating substantially as and for the purpose set forth.

Twelfth, the application of the tappet 36, secured to the rod 33, also the roller set, set in suitable housing, and stationed in position to produce a simultaneous and automatic setting forward of the knees, substantially as set forth.

Thirteenth, the use of the adjustable intermediate support, in combination with and for the purposes set forth in the foregoing claims.

63,615.—B. W. COLLIER, Oxford, Miss.—*Hand Sewing Machine.*—April 9, 1867.—This works in the manner of shears, like Hendrick's patent, No. 21,722, but employs two threads, as in the Wheeler and Wilson machine, to form a lock stitch. The looping hook makes a reciprocating instead of a continuous revolution around the dish bobbin. The bobbin and looping hook are contained in one part, and the eye-pointed needle is attached to the other portion.

Claim.—The combination of the levers A A' B B, case C, arm D, needle H, rotary looper E, hook E', bobbin F, pinion L, cog M, rod N, spring O, and spool I, all arranged as herein described for the purpose specified.

63,616.—CHARLES CROLEY, Dayton, Ohio.—*Window Frame.*—April 9, 1867.—The parting strip in a sash is made in two parts, the lower one of which is held in position by means of a pin and catch.

Claim.—The pocket piece D, having the catch e, or its equivalent, and its arrangement with reference to the window frame A and sash B and C, in the manner substantially as and for the purpose described.

63,617.—JOSEPH G. DENNIS, Camden, Ohio.—*Dough Tray.*—April 9, 1867.—The fire-box, with a damper for regulating the heat, slides under the metallic bottom of the sponge end of the dough trough.

Claim.—The tray A, provided with a metallic bottom, in combination with the damper E, and fire-box B, as and for the object explained.

63,618.—P. S. DEVLAN, Jersey City, N. J.—*Coating Wood.*—April 9, 1867; antedated March 24, 1867.—Liquid silicate of soda is mixed in equal proportions with paper pulp and the compound spread on wood to form a coat thereon.

Claim.—The coating of wood with the compound of silicate and vegetable fiber, substantially as and for the purpose specified.

63,619.—DAVID DICK, Meadville, Pa.—*Gas and Air Engine.*—April 9, 1867.—The air is intermittently

expanded by material which is alternately ignited and extinguished in a closed chamber connected with the generator. The ignition of the combustible is controlled by the motion of the engine. The air which has been deprived of its oxygen is expelled from the generator and fresh air is introduced thereto by a revolving plate that vibrates back and forth around the internal diameter of the cylinder, until it meets a longitudinal diaphragm which divides the induction from the induction passage.

Claim.—First, a generator for heating the air for an air engine by burning a combustible material contained in a closed chamber connected with the generator, substantially as described.

Second, a mechanism, substantially such as described, for alternately producing and extinguishing combustion in the generator of an air engine.

Third, the combination of the section C of the generator, with the tube L, and shaft G', substantially as described, to alternately transfer the combustible material from the closed chamber to the generator, as set forth.

Fourth, a mechanism, substantially such as described, for simultaneously expelling the products of combustion from the generator and introducing fresh air therein.

Fifth, the combination of the stationary diaphragm O with the rotating partition plate Q and generator A, substantially as and for the purpose set forth.

Sixth, the igniting tube H, combined with its piston I, substantially as and for the purpose set forth.

Seventh, the combination of the igniting tube with the generator and closed chamber, substantially in the manner and for the purpose described.

63,620.—WILLIAM C. DODGE, Washington, D. C.—*Boat Detaching Tackle.*—April 9, 1867.—The davit fall is connected with two links which pass through the thwarts of the boat, and are engaged by a bar which being curved at one end is simultaneously disengaged from the links by a longitudinal movement, which is effected by a lever beneath the middle thwart.

Claim.—First, a boat-detaching device, consisting of two locking points or bolts connected by a rigid sliding bar, and having no loose or working joints between said locking points, arranged to operate in combination with the eye-blocks E, substantially as described.

Second, the sliding bar B, having its rear end bent as shown in Fig. 4, for the purpose of enabling both ends to be disengaged from the eye-blocks simultaneously by a single movement, substantially as described.

Third, the combination of the sliding bar B with the spar H, or its equivalent, when arranged for joint operation, as and for the purpose herein set forth.

63,621.—EDWARD DOEN, New Britain, Conn.—*Curtain Fixture.*—April 9, 1867.—The curtain cord runs in the groove of the knob and the projecting prong forms a festoon hook. The knob is bolted to a clutch which is adjustable on the ratchet plate.

Claim.—The combination of the glass or porcelain festoon prong knob d, with the ratchet or holding plate b, as and for the purpose described.

63,622.—JOHN EARNSHAW, Providence, R. I.—*Power Loom.*—April 9, 1867.—The thread carrier rod is eye-pointed and the thread is carried by it in lieu of a shuttle. A shuttle thread engages the loop and the rod is retracted, leaving two filling threads in the shed. The rod slides on bars projecting from the side of the loom, and is actuated by a rocker shaft, a vibrating arm, and connections. The ordinary cap piece of the reed is removed to permit free manipulation of the warp. The shuttle has a segmental guide groove and is operated by a divaricated arm upon a rocker shaft, its two horns engaging the back end of the shuttle alternately.

Claim.—First, an eye-pointed filling thread carrier in combination with mechanism for carrying an interlocking selvedge thread, substantially as set forth.

Second, in combination with an eye-pointed filling thread carrier and mechanism for carrying an interlocking selvedge thread, the reed, substantially as described.

Third, the spring f, arranged to operate the eye-pointed filling thread carrier, substantially as described.

Fourth, the within-described method of weaving by passing a double thread of filling between the warp threads, locking the filling by an independent selvedge thread crossing the warps and binding, and beating up the filling, substantially as set forth.

Fifth, the shuttle *e*, operating in a vertical plane, and crossing the head of the filling thread carrier transversely, substantially as set forth.

Sixth, the vibrating arm *n*, which actuates the shuttle, in combination with the arm *j*, and lever or cam *i*, for operating it, substantially as described.

Seventh, the notch or recess *l* in the shuttle races, for supporting or steadying the filling thread carrier when the shuttle is passing through the loop of the filling thread, substantially as described.

Eighth, providing the eye-pointed filling thread carrier with a notch *m*, as and for the purpose set forth.

Ninth, the combination of the needle stock *D*, with guides *a*, substantially as and for the purpose set forth.

Tenth, forming the eye in the needle, substantially as and for the purpose set forth.

63,623.—JOSEPH L. A. EDWARDS, New Orleans, La.—*Cotton Planter*.—April 9, 1867.—The triangular harrow levels the ground in advance and has a roller attached by which it may be raised out of the ground. The trencher follows the harrow, and is succeeded by the seeder. The slotted wheel which receives the seed and drops it into the funnel box, and the spurred shaft which agitates the seed, are driven by gearing from the supporting wheels of the machine. The drum wheel has a brake attached to put the seeding mechanism out of gear. A scraper covers the seed as planted.

Claim.—First, the employment of the roller *B*, in connection with the separate parts, substantially as and for the purpose set forth.

Second, the arrangement of the holes on the drum wheel *I*, and the arrangement of the wheels, substantially as and for the purposes set forth.

Third, the combination of the harrow *C*, the groover *F*, the seed box *G*, and the scraper or coverer *O*, as and the agitator *K*, and brush *N*, substantially as and for the purpose set forth.

Fourth, the arrangement of the above devices, all connected and operating substantially as and for the purposes described.

63,624.—S. T. EMERSON, Amboy, Ill., assignor to himself and J. B. EDAMS, same place.—*Switch Chair*.—April 9, 1867.—The lower edges of the chair are slightly concave and the lower face is salient, thicker at the center than at the ends, and rests on a resilient pad.

Claim.—First, the shape of the bottom of the switch chair, viz: that portion of it that comes in contact with the cross tie or head block, said shape being a surface inclined from either end down to a given point half way between the ends, and not parallel to the face of the chair, and the planes of the bottom being slightly concave from either side to a point half way between the sides, substantially as herein described and specified.

Second, the switch chair, with a bottom as described, in combination with india-rubber seat, as herein described.

63,625.—LAVINIA H. FOY, Worcester, Mass.—*Pin for the Attachment of Bows and Rosettes*.—April 9, 1867.—The plate has a pin on one side for attachment to the bow, and a similar pin on the reverse side for the attachment to the collar or dress.

Claim.—An improved article of manufacture in a bow and rosette pin, constructed substantially as shown and described.

63,626.—LEWIS FRANCIS, New York, N. Y., assignor to himself and CYRUS H. LOUTREL, same place.—*Making Spring Backs for Books*.—April 9, 1867.—The material for the back is stretched over a steam pipe attached to a frame, and is held in position by hooks and a spiral spring, which are attached to a rod below. The heat of the pipe dries the mucilage and sets the shape of the back.

Claim.—First, the mode, substantially as described, of making spring backs for blank books.

Second, as a new and useful article of manufacture, a spring back for blank books, when the same shall be constructed substantially as described.

63,627.—OBADIAH V. GARNETT, Versailles, Ky.—*Medical Compound*.—April 9, 1867.—Medicine for the cure of fever and ague. The sulphate of iron and alumina is heated until the water of crystallization is expelled; 4 ounces of the result is mixed with 1 ounce of cayenne pepper.

Claim.—The combination of the medicines in the compound herein set forth.

63,628.—DAVID B. GOERVY, Birmingham, Pa.—*Mortising Hubs of Wagon Wheels and the Tenons of Spokes to fit in the Hub*.—April 9, 1867.—The tenons of the spokes have a corrugated surface to correspond with similar surfaces in the mortises and with the faces of the adjacent tenons.

Claim.—Corrugating the tenon of spokes of wheels, and bracing and uniting the end of said tenons in their mortise, so as to form a solid part of hub, as herein described and for the purpose set forth.

63,629.—H. H. GRIDLEY, Auburn, N. Y., and MARY L. GRIDLEY, Burlington, N. J.—*Fruit Box*.—April 9, 1867.—The point and slot of the respective edges are interlocked and form a conic frustal shell into which a bottom is dropped; ragged projections made by punching in the sides of the box prevent its retraction; the shell is shrunk thereon.

Claim.—The joining of the ends of the shell by hooking them together, as shown, and introducing a slide key or other equivalent device, as described, to assist in keeping said ends firmly together.

Also, securing the bottom in its place by means of projections on the inside of the shell, formed from the material thereof, either above or below the bottom, or both above and below.

Also, the shrinking of the wet or green shell upon the dry bottom, when in combination with the above devices.

63,630.—L. C. HAINS, Bedford, Ohio.—*Cheese Vat*.—April 9, 1867.—The furnace is made in two sections, with flue dampers and air inlet to graduate, direct, and check the caloric current beneath the vat which fits the above furnace.

Claim.—First, the arrangement of a vat heater in sections *A*, *B*, and central flue *C*, provided with the damper *D*, as and for the purpose specified.

Second, the sliding dampers *H*, in combination with the flue *C*, damper *D*, and fire box *B*, as and for the purposes set forth.

63,631.—WILLIAM G. HARTLEY, Saxonville, Mass.—*Loom for Weaving Piled Fabrics*.—April 9, 1867.—Two united piled fabrics are woven simultaneously and cut apart by a revolving knife operating in connection with a guard finger in the loom, to form velvet and similar goods. To vary the length of the pile the guide bars are set nearer or further apart.

Claim.—A bill or guard finger *21*, provided with a slit or opening forming two cutting edges, when employed in connection with a circular revolving knife *w'*, substantially as and for the purpose set forth.

Also, the within-described arrangement and combination of the mechanism for operating the knife *w'*, consisting of the shaft *Q'*, crank *o'*, connecting rods *R'* and *Y'*, upright lever *S'*, pulleys *V'* *W'*, drum *20*, and bevel wheels *16* and *17*, substantially as and for the purpose set forth.

63,632.—JOSEPH V. HARTMAN, Marathon, Ohio.—*Churn Power*.—April 9, 1867.—Motion is communicated by clock work to the system of levers which reciprocate the churn dashers.

Claim.—The dash handles *G* *G'*, levers *F* *F'*, links *E* *E'*, bar *D*, and pendulums *C*, arranged and operated as above described, and for the purpose set forth.

63,633.—JOHN HAWORTH, Frankford, Pa.—*Photographic Camera Stand*.—April 9, 1867.—Ratchets on the hinged legs and pawls on the summit of the pillar permit the independent adjustment of the legs, and facilitate any necessary change in height and presentation of the camera.

Claim.—First, the combination of the board I, uprights *c c*, ratchets E E, pawls F F, pillar A, the several parts being constructed and arranged in relation to each other, substantially as described and for the purpose specified.

Second, the combination and arrangement of the spring G and lever H with the pawls F F, substantially as and for the purposes set forth.

63,634.—G. W. HEATH, Burlington, Pa.—*Horse Hay Fork.*—April 9, 1867.—An adjustable lever in connection with the short arm of the fork varies the throw or opening of the arms of the fork. The lever is adjusted by means of a pin and different holes perforated in the short arm of the fork.

Claim.—The arrangement of the adjustable link B, in combination with the short arm A, lever C, and bar D, in the manner and for the purpose shown and described.

Also, providing the upper end of the short arm A of the fork with a series of two or more perforations, in the manner and for the purpose described.

63,635.—THOMAS HEATON, Cornwall, N. Y.—*Check Rein.*—April 9, 1867.—The supplementary rein passes through loops in an ordinary rein, thence through the terrets and gag-rein loops and through the rings of the bit up to the head band. The replication of the rein gives it additional force and draws the angle of the mouth upward.

Claim.—First, the arrangement of the check rein, main rein, and loop C, in the manner described, for the purpose specified.

Second, the main reins B, provided with loops *f*, in combination with the check rein A, whereby the latter can be removed and applied at pleasure, and adapted to an ordinary rein, in the manner as and for the purpose specified.

63,636.—THOMAS R. HICKS, New Britain, Conn.—*Vent Plug.*—April 9, 1867.—A bushing is screwed into the cask and has an aperture on one side. In the upper socket of the bushing is a screw thread in which fits a hollow screw plug containing a valve, which is kept upon its seat by a spiral spring.

Claim.—As a new article of manufacture, a spring pressure vent plug, constructed substantially as and for the purpose described.

63,637.—WILLIAM W. HOWELL, Philadelphia, Pa., assignor to himself and M. MARSHALL, same place.—*Rolling Mill.*—April 9, 1867.—The springs aid the operator in introducing the bar to the desired groove, and the shield guides the bar as it is turned up and directs it in its proper course between the rolls.

Claim.—The combination of the recessed roller B, roller A, shields E, and springs *a*, the whole being arranged and operating as described.

63,638.—LAFAYETTE HUNTOON, Milford, Mass.—*Steam Engine.*—April 9, 1867.—Improvement on his patent of May 15, 1866. The exhaust steam is carried from one cylinder to a larger one in which it is used expansively; but one steam chest and valve are used. The valve is moved by the finger of a rock shaft, which is actuated by crank, connecting rod, arm, &c., moved by the eccentric. The valve governs six openings in the seat leading in the round of the movements from the chamber in the valve to each end of each cylinder and to the ultimate exhaust.

Claim.—First, the combination with the steam cylinders of the steam chest and valve and ports for conducting the steam to and from the said cylinders, under the arrangement herein specified, so that but one valve and steam chest need be employed with the said cylinders as set forth.

Second, the arrangement of the herein described mechanism for operating the valve, the same consisting of the rocker shaft S, vibrating recessed arm H, connecting rod U, with its dovetail end *b*, and the rocker shaft W, with its crank V, and finger Z, the said mechanism being connected with the eccentric rod Q, substantially as and for the purpose set forth.

63,639.—GEORGE W. HURST, Chestertown, Md.—*Churn.*—April 9, 1867.—The dasher has openings for the passage of the cream, and the rod has tubes throughout its length for the passage of air, which is

controlled by valves at the lower ends and adjustable covers at the upper ends of said tubes.

Claim.—The upright square shaft D, with its square dasher J, with oblique apertures K, with extended arms H, and atmospheric tubes E, and valves G, when arranged, constructed, and combined as herein described, and for the purpose set forth.

63,640.—ISAAC B. HYMER, Warsaw, Ind.—*Railroad Rail.*—April 9, 1867.—The rail is composed of four pieces, of which one forms the base and the central supporting flange; this is embraced by two side pieces whose upper portions form a dovetailed socket for the flange underneath the upper cast-steel track rail.

Claim.—The rail D, having a dovetailed tenon clasped between the side plates B B, which are supported against and upon the bed rail A, substantially as described and represented.

63,641.—ZALMON L. JACOBS, Hebron, Conn.—*Beehive.*—April 9, 1867.—The inner hive is formed of frames fastened together by coiled hooks so arranged that the hook end of one passes over the shank of the next. The feed box is reversible, and its mouth is covered with cloth. Boxes arranged upon slides in front of the hives conceal the entrance. The inner hive is placed upon a broad shelf, the greater portion of which is removable.

Claim.—First, the narrow board C, in combination with the board D, substantially as and for the purpose specified.

Second, constructing and arranging the hooks O, so as to connect with each other directly or without intermediate staples or pins, substantially as and for the purpose described.

Third, in combination with the frames L, the employment of the extensible hooks O, when the same are made extensible by means of coils Q, or their equivalents, substantially as and for the purpose described.

Fourth, the combination and arrangement of the reversible box S, the cloth V, and the receptacle U, substantially as described, and for the purpose of feeding bees.

Fifth, the adjustable or changeable appendages *c*, in combination with the case A, or its equivalent, substantially as and for the purpose described.

63,642.—JOHN JENK, Washington, D. C.—*Button.*—April 9, 1867.—The shouldered shank has at one end a disk, and at the other a barbed point, which pierces the clothes, and then enters the head of the button, piercing the diaphragm against whose inner surface the shoulder of the barb impinges to prevent retraction.

Claim.—The diaphragm *f*, confined in the head of a button, substantially as described, and employed in connection with the shouldered shank *a* and disk or fixed piece *b*, in the manner and for the purpose set forth.

63,643.—J. HERVA JONES, Rockford, Ill.—*Hand Seed Planter.*—April 9, 1867.—The respective planters are linked together, and the relative distance of their lower ends is adjusted by slotted plates and hinges and set screws at their upper ends.

Claim.—First, the combination of two single-hand seed planters for joint operation by means of the fulcrum link or cross-bar, and the adjustable hinge, arranged and operating as described.

Second, the combination of the thrusting handles with the slotted hinge and adjusting screws, when constructed and arranged as described.

Third, the hinges, constructed of two leaves, each the counterpart of the other, and united by interlocking the hooks and eyes, for the purpose of dispensing with a pivot pin, and of securing economy of construction, as set forth.

63,644.—ELEAZER MARBLE, Hanover, Wis.—*Washing Machine.*—April 9, 1867.—The lower frame has corrugated rollers, and is suspended by pivoted bars in the seed box; the upper similar frame rests on the lower, and each is connected to a lever on opposite sides of its point of oscillation, so as to be reciprocated on each other, in opposite directions, as the lever is vibrated.

Claim.—The combination and arrangement of the two series of corrugated rollers E and F, with the adjustable pendulum bars P, substantially as and for the purposes set forth.

63,645.—ALDEN B. MARSHALL, Medfield, Mass.—*Carpenters' Bench.*—April 9, 1867.—The tool tray is suspended by its central dividing board to the beam of the tressel; its sides are hinged, and are hooked together to contain tools, or are displayed as a table. The legs are removable, and are attached by elastic straps.

Claim.—First, the application to a carpenters' horse of a tool box, so as to admit of its being adjusted lengthwise or crosswise to the said horse, or detached therefrom, the said box being constructed and arranged substantially as shown, for the purpose herein set forth.

Second, securing the legs of the horse to its body by means of the elastic bands or their equivalents, substantially as hereinbefore explained.

63,646.—JOHN MARTINO, JACOB BEESLEY, and JOHN CURRIE, Philadelphia, Pa., assignor to STUART, PETERSON & Co., same place.—*Heating Stove.*—April 9, 1867.—The cast-iron fire chamber is surmounted by a cap, and the latter by a cylindrical casing, containing an oven encompassed by the calorific current. It combines in small compass heating and cooking arrangements.

Claim.—The cast-iron body B of the stove, the upper portion of which has a number of inclined flat sides, and the lower portion of which is cylindrical, in combination with the ring or ledge W and with the cap F, cylindrical casing H, oven chamber K, and flues L and J, the whole being arranged substantially as and for the purpose described.

63,647.—DON C. MATTESON and T. P. WILLIAMSON, Stockton, Cal.—*Cultivator Teeth.*—April 9, 1867.—The cultivator tooth has a reversible bit; a double mold board, and a broad blade extending laterally; all attached to a curved standard by screw bolts.

Claim.—First, the double-pointed adjustable bit A, and the beveled foot of the curved standard C, resting on the said bit, in combination with the double mold board or shovel B, the same fitting over the standard and bit, substantially as described, for the purpose specified.

Second, the oblong blade or share D, in combination with the manner of fastening the teeth together by bolts passing through the mold board bit or share, substantially as described.

63,648.—JOHN MATTHEWS, Jr., New York, N. Y.—*Pressure Gauge.*—April 9, 1867.—The capacity for expansion being greater on one side than the other, the index finger, which is axial in the normal state, is tipped by the rising of the diaphragm, and its inclination is registered on the graduated bar.

Claim.—The corrugated disk, made more sensitive or capable of greater action on one side of its axial line than on the opposite side thereof by giving a varied or unequal construction to the corrugations, substantially as and for the purpose or purposes specified.

63,649.—PATRICK FRANCIS MILLIGAN, Washington, D. C.—*Check on Car Conductors.*—April 9, 1867.—As a ticket is received by each passenger, upon payment of fare, it is dropped by him into a tube leading to a receptacle inaccessible to the conductor.

Claim.—The employment in a car or other similar vehicle of the checks or tickets C, check box B, drawer D and tubes a, b, when constructed and arranged substantially as and for the purpose specified.

63,650.—SIMON B. MINNICH, Landisville, Pa., assignor to himself and H. K. BURKHOLDER, Lancaster County, Pa.—*Stop Jointed Manure Drag.*—April 9, 1867.—The shaft to which the tines are attached passes transversely through the beam and is held in effective position by the detent lever, whose elevation frees the drag teeth to discharge the load.

Claim.—The arrangement of the notched lever E F X with the stop g on the jointed hook G K, in combination with the box H I, constructed and operating in the manner specified for the purpose set forth.

63,651.—WILLIAM MORRIS, Elkhart City, Ill.—*Animal Trap.*—April 9, 1867.—The wheel is rotated by a coiled spring, the radial wings being in turn detained by their latches which catch upon a detent lug on the case. The motion of the oscillating platform disengages the latch, the wing descends, and the next becomes ready for duty.

Claim.—First, the combination of the revolving wings B, the coiled spring D, or its equivalent, the oscillating platform E, latch F, and catch G.

Second, the combination of the latch F, the detent H, and guide plate I, substantially as set forth.

Third, the combination of the oscillating platform E, the spring E', detent H, revolving wings B, latch F, and catch G, substantially as set forth.

63,652.—GEORGE S. PETRY, Troy Grove, Ill., assignor to himself and GEORGE W. SNYDER.—*Propelling Street Cars.*—April 9, 1867.—A driving gear wheel is placed between the axles of the car and suspended upon a longitudinally sliding frame so as to engage alternately and at will with pinions on either of the car axles, reversing the motion of one axle when disconnected from the other and put in connection with its opposite by a lever and connections. The driving wheel is actuated by a coiled spring which is wound by lever and pawl, and the power is retained by lever and rucks while the transfer of the frame is being made.

Claim.—First, the driving wheel A, coiled spring B, idle wheel H, toothed bars l m, and sliding frame D D, in connection with the axle pinions l L, all related to each other and operating substantially as and for the purpose herein specified.

Second, the hand lever O, elbow lever P, connecting rod q, rock shaft C, and ratchet sleeve c, with pawls z f, for giving tension to the coiled spring B, substantially in the manner and for the purpose set forth.

63,653.—ALONZO C. RAND, Union Mills, Pa.—*Protecting China, Glass, and other Articles.*—April 9, 1867.—An annular groove in the foot or base of the vessel has an elastic projecting ring upon which it stands.

Claim.—The bottoms of vessels of china, earthen, porcelain or glass ware with grooves or depressions for the purpose of applying therein elastic rests, substantially as herein shown and described.

63,654.—FRANÇOIS LOUIS ROUX, Toulon, France.—*Plastic Compound for Protecting Metallic and Non-Metallic Surfaces from the Effects of Air and Water.*—April 9, 1867.—Composed of caoutchouc, 10 parts; spirits turpentine, 45; sulphate of baryta, 60; sulphur, 23; and white lead, 12, properly compounded and laid over a coat of paint or other preparative coating.

Claim.—The preparation, substantially as herein set forth, of a plastic compound applicable to the protection of metallic and non-metallic surfaces from the action of water, air, and other causes of deterioration to which they may be exposed.

63,655.—JACOB RUSSELL, Brooklyn, N. Y., assignor to himself, H. T. MCCOUN, J. L. ROMER, and T. T. BUCKLEY, same place.—*Machine for Making Nails.*—April 9, 1867.—The nail plate is fed by dogs from the table to the cutters, one of which is attached to a block forming part of the oscillating frame, the other being secured to the head block of the cross-rocking beam, which is oscillated vertically by cams and has its bearings in the frame. Springs behind the rocking cutter gauge the feed. A nipper rod catches the blank and turns it over flat, when it is seized by the grippers and headed by the punch. The punches are on each side and the mechanism is oscillated in alternate directions as the heads are made from alternate edges of the nail plate.

Claim.—First, the combination with a stationary nail plate feeding table, or its equivalent, of cutters, nipper, gripper, and headers, arranged for operation together on a bed or frame having an oscillating motion about an axis perpendicular or nearly so with the horizontal clipping edges of the cutters, substantially as specified.

Second, the arrangement relatively to the cutters and headers of the nipper K, operating to turn the

blank by striking it at or about the middle of its length, essentially as herein set forth.

Third, imparting to the headers M M an oscillating movement in unison towards and from opposite sides of the nail plate feed in addition to their heading motion, by means substantially as shown and described.

63,656.—SYLVANUS SAWYER, Fitchburg, Mass.—*Dividers and Calipers.*—April 9, 1867.—The fingers are moved by segment racks on their pivot ends, which are engaged by a screw thread on the handle. A set screw connects with a loose collar on the handle to fit the fingers.

Claim.—The combination of the screw or worm gear A D, with the stirrup and binder F, or its equivalent, as applied to dividers and calipers, the whole being constructed and operating substantially in the manner herein described and set forth.

63,657.—JOSHUA S. SHAFER, Plymouth, Mich.—*Land Roller.*—April 9, 1867.—Each section is hinged to the rear extension of the tongue and accommodates itself to the inequalities of the ground.

Claim.—Hinging the frames B B to the common end piece A, in which end piece rollers C C have their bearing for the purpose of making a flexible roller, substantially as specified.

63,658.—WARREN SHUMARD, A. LYON, and JASPER N. ROBBINS, Goshen, Ohio.—*Saw Mill.*—April 9, 1867.—The pivoted rest is automatically fed by a spring pawl upon a lever which is reciprocated by an oblique bar, attached to the saw gate and made adjustable to vary the feed.

Claim.—The arrangement of oblique adjustable bar M, on the sash H, in combination with the screw N, lever P, pawl Q, and segmental rack G, for the automatic feed of the rest B, in the manner set forth.

63,659.—PHILANDER SISSON, Brant, N. Y.—*Potato Digger.*—April 9, 1867.—The digging platform at the front end may be raised clear of the ground by a cam being pivoted at the rear for that purpose. The potatoes pass from the platform to a rake screen, between whose bars pass the forwardly curved teeth of the reel. The series of teeth are alternately nearer and more distant to act as stirrers and sifters.

Claim.—The hinged platform C, having a sharp cutting edge c^3 , projecting forward of the axle of the driving wheels and having stationary rake teeth j , projecting in rear of the axle, in combination with a revolving wheel having fingers f^1 , with flat connecting bars f^2 , substantially as described.

63,660.—GEORGE W. SLATER, New Haven, Conn.—*Bow Iron for Carriages.*—April 9, 1867.—The bow sockets have central projecting plates to traverse kerfs in the bows and are attached to their base plate by rivets cast on the inside of the same; a similar plate covers their other sides. These plates are pivoted to the seat frame.

Claim.—First, the casting of rivets or projections upon the bed plate a , substantially as and for the purpose set forth.

Second, the thimbles E E, as constructed and applied, in combination with bow irons C C, substantially for the purpose set forth.

Third, the back plate D, in combination with the bed plate a , when both are constructed as and for the purpose described.

63,661.—WILLIAM SOOY SMITH, Oak Park, Ill.—*Excavating and Dredging.*—April 9, 1867.—The receiving chamber is at the head of the suction pipes, and the mud is driven thence by an upward jet of steam in the discharge pipe. The mouths of the several suction pipes are governed by flap valves; and the mud is driven in by natural pressure as a partial vacuum is made in the receiver by the injected jet of steam.

Claim.—The combination and arrangement of the receiving chamber A, tubes $b b$, ejection pipe a , caps $c c$, rack D, pinion d' , car truck B, movable rail $e e$, upon the sliding frames $g g$ of the sills $h h$, substantially as herein set forth, for the purpose specified.

63,662.—JOHN P. SPANGLE, Hopewell Centre, N. Y.—*Car Coupling.*—April 9, 1867.—The pivoted

lever by which the connecting pin is raised operates in conjunction with a movable bumper and catch, so that the lever is released and the pin allowed to drop upon collision of the drawheads.

Claim.—First, the jointed upper lever C D, in combination with the coupling pin and the receiving drawhead, operating substantially as described.

Second, the lower lever G, in combination with the hook F, the spring M, and drawhead I, operating substantially as described.

63,663.—GEORGE W. SPAULDING, Norton, Mass.—*Switch.*—April 9, 1867.—The switch is formed of portions of common rails. The main rails are cut obliquely across to allow the passage of the wheel flanges from either side track when running onto the main track.

Claim.—A safety switch for railroads, composed of the grooved rail a , and the parts b and d , when constructed and operating substantially as above set forth.

63,664.—CHARLES W. STAFFORD, Saybrook, Conn.—*Garbage and Ash Box.*—April 9, 1867.—The box is inclosed in a case provided with a cover and can be elevated and dumped by a follower, which is operated by a rack pinion and chain.

Claim.—First, a garbage or ash box placed within a case provided with a lid or cover, and arranged as herein shown and described, to admit of being elevated and tilted or dumped, in order that its contents may be discharged into a cart, substantially as described.

Second, the rod H, attached to the bottom of the garbage or ash box D, and provided with the rack c , the hollow part C of the case A, in which the rod H works, the pinion F on shaft G, and the chain, all arranged to operate in the manner substantially as and for the purpose set forth.

63,665.—CHARLES W. STAFFORD, Saybrook, Conn.—*Ash or Garbage Box.*—April 9, 1867.—The semispherical stationary cover is connected by pivots at its base to its counterpart, which slides over it on the removal of the spring catch. A roller in front facilitates the removal of the box.

Claim.—A portable garbage and ash box, constructed of iron or other suitable metal, having a roller B in its base, fixed and movable semispherical covers E F, and suitable handles, all constructed and arranged substantially as herein shown and described.

63,666.—J. DUTTON STEELE, Pottstown, Pa.—*Bridge.*—April 9, 1867.—The double series of inclined main and counter braces in connection with the brace rods make a light truss in which vertical posts are unnecessary.

Claim.—The combination of the two series, substantially as set forth, or their equivalents, made either of wood or of iron, in the manner and for the purpose hereinbefore described.

63,667.—LEVI STEVENS, Fitchburg, Mass.—*Machine for Carbureting Air to Produce Inflammable Gas.*—April 9, 1867.—The air passes through the tortuous passage of a shallow box partly filled with liquid hydrocarbon and saturated porous substances. From this box the air passes into one end of a cylinder containing a meter wheel having disks of wire gauze attached to its axis. This cylinder is kept half filled with the liquid by a float and valve. From this cylinder the air passes through another box similar to the first, and from that to the burners.

Claim.—The use of the meter wheel for the purpose of carbureting atmospheric air, in the manner substantially as described.

Also, the flowage regulator, constructed of the several parts specified, and arranged substantially as described and for the purposes set forth.

63,668.—ANSON K. STONE, Oronoco, Minn.—*Wheel Carriage.*—April 9, 1867.—Oblique braces extend from each axle to the contrary end of the carriage box, and have brace springs connecting with the lower sides of the axles.

Claim.—The combination as well as the arrangement of the two main springs D D and the four elastic braces or brace springs $c c c c$ with the two axles and the sweep bar, as specified.

Also, the combination as well as the arrangement of the elastic braces *d d* with the four elastic braces *c c c c*, the two main springs *D D*, the two axles, and the sweep bar, the whole being substantially as herebefore explained.

63,669.—ANSON K. STONE, Oronoco, Minn.—*Wheel Carriage.*—April 9, 1867.—The main springs connect with the axles and act as a perch. The auxiliary springs aid in supporting the axles and serve as braces to the main springs.

Claim.—The above-described arrangement of four main springs *D D E' E'* with each other, the carriage body, the rear axle, and the sweep bar of the front axle.

Also, the combination as well as the arrangement of the auxiliary or transverse brace springs *F F* with the main springs *D D* and *E' E'*, arranged and applied to the carriage body, the rear axle, and the sweep bar of the front axle, substantially as specified.

63,670.—WILLIAM S. STORMS, Middletown, Ohio.—*Furnace for Steam Boilers.*—April 9, 1867.—The unignited gases which escape from the furnace are collected in a chamber, and when oxygenated by conduction of atmospheric air through flues, are returned to the fire chamber for combustion.

Claim.—First, the combination with the fire chamber of a furnace or other heater of an auxiliary chamber communicating with the fire chamber and outside air through flues and passages, arranged substantially as shown and described.

Second, the combination of the fire chamber and boiler with the upper arch and lower arch or fire bridge of the furnace, under the arrangement and for operation as shown and described.

63,671.—WILLIAM D. STROUD, Oshkosh, Wis.—*Corn Shelter.*—April 9, 1867.—The obliquely-ranged teeth on the respective plates have a raking action on the ears of corn. The oscillating plate is pivoted at one end, adapting itself to the size of the ears by a spiral spring. The shelled corn drops on a screen below.

Claim.—The movable plate *c* and the stationary plate *b*, with the diagonal setting of the teeth thereon relatively one to the other on the respective plates, the lever *d*, the inside rim *n*, the outside rim *m*, the hopper *e*, the adjustable screw *s*, the adjustable spring bearing *g*, and the screen *f*, when constructed and arranged relatively to themselves and to the frame *a*, substantially as described, for the purposes set forth.

63,672.—EDWARD SULLIVAN, Pittsburg, Pa.—*Piston Packing.*—April 9, 1867.—Inwardly opening valves are placed in the ends of the piston, the steam duct communicating with the central recess to conduct steam to force out the flexible side rings. The sliding plates are rabbeted together to prevent leakage of steam.

Claim.—First, the recess *C* between the packing rings of a piston head of a cylinder of a steam engine, as herein described and for the purpose set forth.

Second, the plates *g* and *h*, when used in combination with a joint or joints in metallic and expansive packing of a piston head, as herein described and set forth.

Third, in connection with the above the valve *x*, constructed, arranged, and operating substantially as herein described and for the purpose set forth.

63,673.—JOHN TESSEYMAN, Dayton, Ohio.—*Planing Machine.*—April 9, 1867.—The tool passes through a slot in the head of the bolt, which is adjustable about an axis tangential to its path when in operation, and which traverses the oblique-faced holding washer and the end of the arm. The washer has radial serrations on its rear face, which is perpendicular to its axis, and the arm has similar serrations, so that by loosening the bolt the tool may be turned in the plane of the main axis of the head and fixed, by tightening the nut, to any inclination.

Claim.—First, the provision in a planing head of an obliquely-faced washer or tool holder *H*, adjustable about an axis tangential or nearly so to the path of the bit, substantially as set forth.

Second, a tool holder for a disk or conical planer, consisting of the oblique-faced and serrated washer *H*, slotted bolt *D E f*, nut *E*, and serrated head *B*, for the purpose set forth.

63,674.—CHARLES H. VANHOUTEN and JOSEPH M. CRANE, Newark, N. J.—*Machine for Pouncing Hats.*—April 3, 1867.—The hat is fastened to the block by the binder, which fits around the edge of the rim. Pressure on the treadle shifts the belt to the fast pulley and rotates for the vertical shaft, when the pouncer is applied by hand.

Claim.—The sliding rim block, provided with the ring *G*, for adjusting the same, and having a hinged ring or button *H*, in combination with the hat block *D*, when arranged to operate substantially as herein shown and described and for the purposes set forth.

63,675.—THOMAS VARNEY, San Francisco, Cal.—*Quartz Mill.*—April 9, 1867.—The grinding surfaces approach each other and gradually assume a horizontal direction as they descend. These surfaces are smooth and have radial grooves containing wood.

Claim.—The combination of the slots in the smooth grinding surfaces filled with wood with the peculiar form of the revolving grinder *m* and stationary grinder *p*, when constructed and operating substantially as described and for the purpose as set forth.

63,676.—W. J. WALKER, Baltimore, Md., assignor to CAROLINE M. WALKER, same place.—*Manufacture of Light Bread.*—April 9, 1867.—Explained by claim.

Claim.—The combination of super-phosphate of lime and muriatic acid in nearly equal quantities, and bi-carbonate of soda in such quantity as when united in the dough will in process of baking evolve sufficient gas to make light bread or pastry, substantially as above described.

63,677.—WILLIAM WAY, SAMUEL B. WAY, and SAMUEL C. POMEROY, South Butler, N. Y.—*Dish Washer.*—April 9, 1867.—The dasher wheel in the lower portion of the box throws water upon the plates and other vessels which are laid upon the racks above. The dasher shaft is driven by a square-ended coupling rod introduced longitudinally through the end of the box.

Claim.—First, the depression *C* in the bottom of vessel *B* for collecting all the water in the machine immediately about a wheel *D*, which is in diameter considerably smaller than the diameter of the main chamber *B*, substantially in the manner and for the purpose set forth.

Second, the washing wheel *D* having buckets with concave faces in a radial direction, and arranged spirally in a longitudinal direction, substantially as and for the purpose set forth.

Third, the lateral sliding shaft *f* and coupling *e*, in combination with a horizontal washing wheel *D* and rack *K*, substantially in the manner and for the purpose herein specified.

63,678.—JAMES A. WEBB, Madison, N. J., and CHRISTOPHER CORY, Lima, Ind., assignors to CHRISTOPHER CORY, Lima, Ind.—*Evaporating Pan.*—April 9, 1867.—The passages in the steam compartment formed under the pan are regulated by means of partitions and valves to confine the heat to the center or side of the pan.

Claim.—First, the application of steam, or its equivalent, to evaporating pans by means of under channels, with or without valves, so arranged as to produce the greater amount of heat and ebullition either at the center or at one side of the pan or at certain given portions thereof, as desired, while other portions of it shall be less heated and agitated, as herein set forth.

Second, the applying of steam beneath the pans so that their interior shall be left unobstructed for the work of the operator.

Third, the combination with an evaporating pan of a steam channel or chamber, substantially as above set forth.

Fourth, the application of non-conductors of heat to the under steam channel or chambers of evaporating pans, substantially as set forth and described.

63,679.—EDWIN WESCOTT, Hudson City, N. J.—*Sawing Machine.*—April 9, 1867.—The feed rollers are so arranged that each pair can be moved in or out by turning a screw without disturbing the connection with the driving mechanism. The endless screw gears into wheels on the roller shaft at any point of their lateral adjustment. One jaw of the gauge and one pair of rollers are made yielding by cushions.

Claim.—First, the screw spindle J and worm wheels *f f'*, in combination with the feed rollers D D', constructed and operating substantially as and for the purpose described.

Second, the adjustable boxes *l l'*, gudgeons *m*, set screws *n*, and saw spindle L, when constructed and arranged as herein set forth for the purpose specified.

63,680.—ALBERT M. WHITE, New York, N. Y.—*Nozzle for Hose Pipes.*—April 9, 1867.—The nozzle screws into its socket and presses the base valve towards or upon its seat, thereby regulating the flow of water, which passes through side openings into the exit pipe.

Claim.—The combination of the socket A, pipe B, and collar C with the valve *g* and valve seat *e*, all constructed, arranged, and operating substantially as herein shown and described.

63,681.—T. R. WHITE, Philadelphia, Pa., assignor to himself and W. G. BEDFORD, same place.—*Rock Drill.*—April 9, 1867; antedated March 29, 1867.—The hollow cylindrical drill-stock has three radial and three curved cutters, arranged alternately, and partially projecting therefrom; these cutters have serew rods secured by nut within the stock.

Claim.—First, the combination of a drill stock and detachable cutters D E, when the latter are constructed and adapted to each other and for attachment to a stock, substantially as and for the purpose specified.

Second, the detachable block C, in combination with the drill stock and with the detachable cutters D E, their rods *c* and nuts *d*, or their equivalents, the whole being constructed and arranged substantially as and for the purpose set forth.

Third, a rock having three radial and three curved cutting edges, arranged in respect to each other as shown and described.

63,682.—T. R. WHITE and W. G. BEDFORD, Philadelphia, Pa., assignor to W. G. BEDFORD and WIMER BEDFORD, New York, N. Y.—*Well Boring Apparatus.*—April 9, 1867; antedated March 29, 1867.—The drill shaft is connected to a block, which slides

in a slot of its operating disk. The spring blocks keep the wrist block at the rising end of the slot until it reaches the highest point, when it and the drill rod suddenly descend. The upper end of a pawl rod has a pin traversing an elliptical slot in a disk upon the drill-operating shaft, and its catch engages a ratchet wheel on a bevel wheel shaft, which by suitable connection to the drill shaft causes its partial rotation at each stroke. The drill is fed by the spring bar, which comes in contact with inclined ribs in a bracket through which the rod slides, and causes the rotation of the screw of the drill rod in the sliding nut. The contrary rotation of the screw is prevented by a spring pawl and crown ratchet.

Claim.—First, the revolving disk E, with its slot and spring catches *b b'*, or their equivalents, in combination with the sliding block F connected to the drill rods, and the projection *d*, or its equivalent, the whole being constructed and operating substantially as and for the purpose described.

Second, the rod H and spring bar *p*, screw I and nut G', secured to the drill rods, in combination with the bracket G, and its inclined projections *n n*, and the within-described operating devices or their equivalents, the whole being constructed and arranged for joint operation, substantially as specified.

Third, the swivel *e*, with its ratchet *j*, in combination with the rod H and its spring pawl *i*, substantially as and for the purpose set forth.

Fourth, the shaft D', its wheels N and K, in combination with the rod J, wheel *k*, cam disk L and rod M, the whole being arranged and operating substantially as described.

63,683.—A. W. WILCOX, Worcester, Mass.—*Melodeon.*—April 9, 1867.—A chamber over the reeds has a valve at top and bottom. The swell box surrounds the chamber, and has a valve between it and the reeds. These three valves are to alter the tone, and are opened or closed by stops. Valves at the top and bottom of the swell box are operated by a lever.

Claim.—First, the combination with chamber B of the valves *1' 2'* and *3'* for the purposes stated.

Second, the combination with chamber B and swell box C of the valves *1' 2'* and *3'* and D E, arranged for joint operation, as set forth.

63,684.—WM. HENRY WOODS, San Francisco, Cal.—*Bit Brace.*—April 9, 1867.—The collar has within it a sleeve block and axial pin, so that as it is screwed fast upon the shank of the brace, it is rigidly held to its place, preventing rattling.

Claim.—The brace head, consisting of the collar D, the block E, the pin *g* and the steps *m* and *n*, with the nut G, substantially as and for the purpose described.

63,685.—ANDREW R. WORTH, Nantucket, Mass.—*Seed Planter.*—April 9, 1867.—The seed wheel has cups corresponding to the number of grains planted in each hill, is adjustable as to distance, and drops the seed in the tube, which delivers it in the rear of the plow. The automatic hoe covers the seed, and is succeeded by the leveling roller. The machine is operated by devices in connection with the driving wheels.

Claim.—A seed wheel N, provided with a number of cups exactly corresponding to the number of seed required to be planted in a single hill, or so placing the cups at such a distance apart as will regulate the required distance of the seed from each other, when planted in a drill.

Also, the block *m*, with its spring *o*, in combination with the bar U, with its spring *s*, inclined portion *r* and stop *q*, operating substantially as and for the purpose set forth.

Also, a hopper or seed receptacle M, with its partitions or plates *h*, and having its opening *i* to the seed passage, constructed substantially as above described, in combination with a revolving seed wheel N, provided with a number of seed cups *g*, equal to the number of seed to be planted in a hill, substantially as set forth.

Also, a hopper or seed receptacle M, made removable, in the manner and for the purpose set forth.

Also, the boxes X and roller T, in combination with the frame R, arranged and operating substantially as and for the purpose set forth.

63,686.—J. H. ALDRICH, Nashua, N. H.—*Cattle Car.*—April 9, 1867.—The troughs are exposed by opening a shutter on the outside of the car. A false bottom holds the feed above the water below it in the trough.

Claim.—The combination and arrangement of the water and feed trough, separated by the lid, when constructed and used upon a cattle car, in the manner and for the purpose herein described.

63,687.—W. D. ARMSTRONG and W. I. ARMSTRONG, Harlem, Ill.—*Gate.*—April 9, 1867.—The lower ends of the levers are pivoted to the central posts and above to the middle standard of the gate. The rear lever is pivoted at top to the rear standard of the gate, and at bottom to a post in the ground behind. The gate is partially counterbalanced and rises as it slips open by a longitudinal motion.

Claim.—First, the combination of the eccentric pulley or wheel I with one of the central posts B, and with the cord or chain S of the heavy or balance weight R, substantially as herein shown and described and for the purpose set forth.

Second, pivoting the lower ends of the side levers J to the central posts B, by a long bolt K, substantially as herein shown and described and for the purpose set forth.

Third, attaching a spring catch V to the forward end of the gate, and operating it by the cords or chains M, by which the gate is operated, substantially as herein shown and described.

Fourth, the combination of the guards L with the

sides of the gate G, and with the side levers J, substantially as herein shown and described and for the purpose set forth.

Fifth, the combination of the long pulleys or friction rollers N and U with the central posts B, and with the cords or chains M and S, substantially as herein shown and described, and for the purpose set forth.

63,688.—COLUMBUS AULLS, Bridgewater, Mich.—*Sheep-feeding Trough.*—April 9, 1867.—The trough is made to revolve on hinges attached to the standards, being left bottom up when not in use, to prevent its collecting snow, &c. It has a counterbalance to keep it steady when upright.

Claim.—First, constructing the trough A with one sideboard *a'* extended beyond the ends of the trough, substantially as herein shown and described and for the purpose set forth.

Second, the combination of the counterbalances E with the trough A, substantially as herein shown and described and for the purpose set forth.

Third, the combination of the standards B, having slats or braces D attached to them, with trough A, substantially as herein shown and described and for the purpose set forth.

Fourth, hinging the trough A to the standard B, substantially as herein shown and described and for the purpose set forth.

63,689.—ROBERT BAIN, Brooklyn, N. Y.—*Pipe Wrench.*—April 9, 1867.—One jaw has sliding adjustment in the strap pivoted in the other. A thumb screw and key fix the adjustment to suit any sized pipe.

Claim.—In combination with the jaw levers A and B the sliding strap C, with its screw D, and wedge, or jib, F, for operation together, essentially as herein set forth.

63,690.—EDGAR B. BEACH, West Meriden, Conn.—*Convertible Rifle Sight.*—April 9, 1867.—The adjustable slide is attached to the barrel in a transverse dovetail groove, and has attached to it a spring hinge to which the open and covered reversible sights are affixed, the one retiring as the other is raised. It is held in position by a spring catch.

Claim.—The combination of the covered sight *c* and open sight *d*, constructed and arranged so as to be changed to present either the one or the other, substantially in the manner described.

63,691.—GEORGE M. BEARDSLEY, Fentonville, Mich., assignor to himself and C. D. BOUTELL, Deerfield, Mich.—*Apparatus for Upsetting Tires.*—April 9, 1867.—The hand lever acts through the segmental gear rack, toggles, pivoted levers, and connecting rods to vibrate the arms; the tire is clamped to the latter by cams and adjustable blocks, between which it is placed. The cams are operated automatically by the same movement which operates the arms.

Claim.—First, in combination with the levers *d* and a device for operating the same, the levers B, rod *g*, and cams *h*, when the latter are used in connection with movable or stationary jaws $r^1 r^2$, the arms H, substantially in the manner and for the purpose set forth.

Second, the self-clamping lever cams *h* in combination with the jaws r^1 , forming a clamping device, as herein described.

Third, the movable jaws $r^1 r^2$ in combination with the arms H II, swinging upon the same center, for the purpose herein set forth.

63,692.—GEORGE M. BEARDSLEY, Fentonville, Mich., assignor to himself, C. D. BOUTELL, and G. CARPENTER.—*Straw Cutter.*—April 9, 1867.—The curved knife is set eccentrically in connection with a slot in the solid fly wheel, and the straw is fed continuously through a square opening, being bounded by four belts running on rollers whose axes are rectangularly arranged. The jaws are extended except when the knife is cutting, and allow free exit to the straw.

Claim.—First, the knife C when shaped as shown, and set eccentrically upon a fly wheel solid, except as to a slot conforming to the knife, substantially as and for the purpose set forth.

Second, the endless bands E in combination with the pulleys G, constructed, arranged, and receiving motion, substantially in the manner and for the purpose set forth.

Third, a mechanism for operating automatically and simultaneously the jaws P and Q in relation to the knife C, substantially as and for the purpose set forth.

63,693.—HIRAM BECKWITH, Grass Lake, Mich.—*Scaffold Bracket.*—April 9, 1867.—The blades of the brackets lie on two consecutive courses of shingles, their rear parts raising at right angles and connecting at top. The lower one has a brace diverging behind and fastening at its foot to the shingles below.

Claim.—A roof bracket, constructed substantially as herein shown and described, with two blades, with their back pieces, and supported by the brace D, for the purposes set forth.

63,694.—JOHN P. BIRCH, Philadelphia, Pa., assignor to himself and G. W. PATERSON, Newburyport, Mass.—*Rotary Steam Engine.*—April 9, 1867.—The pistons have radial sliding movement in their case and their inner ends rest in indentations of the sleeve upon a shaft axial to the cylinder. This case has eccentric bearing in the head of the cylinder and the steam acts on the portions of the pistons projecting from the case. The pistons have a soft metal packing to the cylinder and the case. That to the cylinder is in form of a three-sided prism, and rests in angular grooves of the piston plates, and that to the case is plano-convex to fit the piston and a segmental groove of the case and allow oscillation therein. The steam has one education and two induction openings, to allow the rotation in either direction. The cylinder is supported on trunnions.

Claim.—First, the combination with the steam cylinder and eccentric piston case of the pistons under the arrangement herein described, so that the said pistons, although revolving upon a common axis or center of motion concentric with that of the steam cylinder, shall be unconnected with and separate from each other and the said cylinder, substantially as shown and described.

Second, the combination of the hollow piston case, mounted upon a shaft, having its bearing in one end of and eccentrically to the steam cylinder, with the pistons separate from each other, but revolving upon a common axis, which is also the axis of the steam cylinder, substantially as shown and set forth.

Third, the arrangement of the steam cylinder with reference to its three bearing points located one upon each side of the cylinder, and the third upon the shaft of the piston case, substantially in the manner and for the purposes herein specified.

63,695.—F. A. BLAKE and H. A. TYRRELL, Worcester, Mass.—*Flue Scraper.*—April 9, 1867.—The spring upon the rod expands against the inner surface of the flue to clean it; stop pins limit the expansion of the spring.

Claim.—First, the combination with rod A of the spiral spring, substantially as and for the purposes stated.

Second, the combination of spring B with rod A, and pins *a* and *b*, substantially as and for the purposes set forth.

63,696.—A. T. BOON and D. M. OSBORN, Gallesburg, Ill., assignor to A. T. BOON and THOMAS R. MARKILLIE.—*Car Coupling.*—April 9, 1867.—The entering link strikes the inner projection of the forked arm and brings up the other projection to engage it. The guide plates hold the link in position, and the catch engages the effective projection. The catch is raised and sustained by a cam lever to uncouple or prevent coupling.

Claim.—The pivoted catch or dog B, curved guides F, rubber bar *e*, and lever C, as arranged, and combined, and operating in combination with the forked arm D, and link E, substantially in the manner and for the purpose as herein set forth.

63,697.—A. BRISBANE, New York, N. Y.—*Wooden Pipe.*—April 9, 1867.—The boards are steamed and bent longitudinally in cylindrical form till the edges lap on each other, and are then riveted.

Claim.—As a new article of manufacture, wooden pipes or tubes formed by bending boards, slats, or strips of wood longitudinally, as herein described.

63,698.—H. C. BRISTOL, Ravenna, Ohio.—*Cultivator.*—April 9, 1867.—Rectangular frames are pivoted in front of the axles, and chains from their front bars are attached to the double tree. The side bars give bearings for adjustable standards. The frames are adjustable by levers and ratchet racks. A central plow on a pivoted standard has a segmental adjustment slide, passing through a backward extension of the tongue which supports the driver's seat.

Claim.—First, the movable frames C, provided with the adjustable standard G and shares H, as arranged and connected in combination with the levers D, draft chains P, and carriage, for the purpose and in the manner set forth.

Second, the jointed standard I, provided with the shovel J and guide stay K, in combination with the standards G, shares H, and carriage, as and for the purpose described.

63,699.—MAHLON BROOKFIELD, Brookfield, Iowa.—*Let-off Mechanism for Looms.*—April 9, 1867.—The traction belt of the pulley on the warp beam is connected to a weighted beam; and the amount of traction is regulated as the amount of yarn upon the beam decreases by the turning of the screw rod upon which the lever weight is suspended. The rod is rotated by changeable sets of gearing interposed between it and the beam, the sets corresponding to various sizes of yarn, and indicated by the horizontal lines on the scale beam. The vertical lines upon the latter correspond to definite proportions of radial capacity of the beam. A quantity of yarn being wound, the revolutions are counted, the thickness measured, and from this data the proper initial position of the weight is found and also the proper set of gearing for reaching zero on the scale as the last coil is unwound from the beam.

Claim.—The graduated scale beam F, combined with a feed screw H, and weight suspended from a friction strap or device on the warp beam, and to be used in connection with different sets or speeds of gear, substantially as described and represented.

63,700.—CLARENCE E. BROWN, Northampton, Mass., assignor to himself and FLORENCE MANUFACTURING COMPANY, same place.—*Blacking Case.*—April 9, 1867.—Explained by the claim and illustration.

Claim.—A blacking case, composed of the exterior shell or case A, surrounding and containing the brushes B C, the latter brush C being provided with a rim b formed so as to fit over and support the blacking box D, all these parts being arranged in the manner and for the purpose herein shown and described.

63,701.—JOHN CARROLL, New York, N. Y.—*Sheet Metal Boiler and other Vessels.*—April 9, 1867.—The heads have spiral corrugations on their rims similar to those on the body to which they are screwed.

Claim.—Providing the cylindrical body A of sheet metal vessels with spiral corrugations which extend from end to end of the body for the purpose of strengthening the same as well as to facilitate the attachment of the heads B B to the body, which heads are also corrugated, substantially as herein shown and described.

63,702.—ENOCH CARTER, Newburgh, N. Y.—*Purifying and Preparing Glass Ore.*—April 9, 1867.—The glass ore is melted in a reverberatory furnace, with or without alkalies as a flux, and is used in lump or dropped in water as cullet. It is manufactured by itself or in conjunction with other material.

Claim.—First, melting the glass ore or rock in a reverberatory or other furnace, with or without alkalies or salt as a flux, and using the product in lump as it comes from the furnace, or dropping it in water as "cullet."

Second, the use of this "cullet" for the manufacture of glass, either alone or in combination with the crude ore with alkaline, sand, lime, quartz, or other materials.

63,703.—MICHEL CELLERIE, Philadelphia, Pa.—*Machine for Stretching and Winding Silk Thread.*—

April 9, 1867.—The object is to equalize the thread and stretch it after it is twisted and spooled. The pressure on the brake lever is variable at will; the thread is reeled from the spool in the trough to the reel, which is driven by frictional contact with a pulley on the main shaft; the thread is distributed on the reel by a traversing guide. The reel, when full, is removed from its bearings, and the detachable part being removed allows the removal of the skein.

Claim.—First, in combination with a silk reeling machine, constructed as described, an adjustable lever brake applied to the pulley of the spindle, which carries the bobbin from which the silk thread is reeled, for the purpose of subjecting the thread to a uniform tension and thus equalizing its quality, as specified.

Second, the removable friction reel R R', constructed, arranged, and operating as described.

63,704.—H. S. CONNELLY, Clymer, N. Y.—*Combined Roller and Seeder.*—April 9, 1867.—The boxes of the inner journals of the forward rollers slide vertically in the frame, and balance each other on a pivoted beam to whose ends they are connected. The pivoted scrapers clean the rollers. The seed slide is operated by a cam disk on the shaft of a roller running on the surface of one of the main rollers. An additional roller spans the balk left by the others.

Claim.—First, resting the inner journals of the main rollers in adjustable bearings and connecting said bearings with the driver's seat, substantially as and for the purpose set forth.

Second, the combination of the cross arm f, with the adjustable bearings e e and the seat C, for the purpose of allowing the one seat to act upon the two rollers, substantially as specified.

Third, the combination with the subject-matter of the preceding claim of the joints formed of the elongated tenons d and mortises e for allowing each roller an independent action, as specified.

Fourth, the combination of the pivoted scrapers G with the adjusting roller B, as shown and described and for the purposes specified.

Fifth, the arrangement of two or more slides K K, resting in compartments v and connecting by screws and slots w x, or equivalent, with the single head u, in such a manner that the escape of the contents of each compartment may be exactly gauged to produce the desired mixture, as specified.

Sixth, the special construction of and arrangement of the machine, as herein set forth.

63,705.—JOSEPH M. COOMBS, Boston, Mass., assignor by mesne assignments to GEORGE W. CHIPMAN and JOHN RABDIN, Lynn, Mass.—*Carriage Wheel.*—April 9, 1867.—Boxes are bolted into the felloe to receive the spokes, which have heads between which and the inner flanges of the boxes are annular rubber springs and washers. Adjustable nuts tighten the spokes. Similar flanges and rubber springs are also attachable to the inner ends of the spokes.

Claim.—An elastic wheel constructed with a provision for contraction of the bearing surface of the felloe towards the hub, when also so constructed that the expansion of the sides of the wheel produced by such contraction is resisted by springs, substantially as set forth.

63,706.—JOSEPH CROMPTON, Little Falls, N. J.—*Bolt and Bolt Head.*—April 9, 1867.—For the attachment of one plate to another where the inner side of one is inaccessible. The bolt has an eccentric head which is passed through the opening in said plate and then moved, so that the shoulder bears against the inside of the plate; the said position is maintained by a key, and the screw bolt is furnished with the usual nut.

Claim.—First, the eccentrically-headed screw bolt C, in combination with the nut E and the eccentric collar H placed around the bolt, substantially as described.

Second, the combination of the bolt C, having an eccentric head F with the eccentric collar H, or its equivalent, the patch or plate B and the boiler plate or article to which the plate B is united, substantially as shown.

63,707.—DAVID CUMMING, JR., New York, N. Y., assignor to himself and STEPHEN WM. SMITH, same

place.—*Cutter Head for Wood Molding Machines.*—April 9, 1867.—The cutters are held between an upper and lower guide disk, and the spindle has vertical adjustment to bring either guide into connection with the pattern. In operating, the pattern and stuff are clamped together and the head adjusted so that the guide and cutters are brought to the pattern and stuff respectively. After as much has been cut away as the grain allows, the pieces reversed, and the cutter head having been adjusted to bring the guide to the pattern, the remainder is cut. The spindle is carried beneath the head and plays in a guide box.

Claim.—A cutter head formed with a guide both above and below the cutter, in combination with mechanism for raising or lowering the cutter relatively with the bed, so that the pattern and wood to be planed can be laid either side upwards on the bed (according to the direction of the grain of the wood when planing) and the cutter and guides be brought to their proper places relatively to the wood and the pattern, as set forth.

63,708.—JOHN T. DAWSON, Frostburg, Md.—*Churn.*—April 9, 1867.—The revolving dasher is attached to a vertical shaft in a rectangular box and has four beveled wings which throw the cream upward above a perforated horizontal disk that retains the butter as formed.

Claim.—First, the revolving dasher D, constructed substantially as described, and operating in combination with the rectangular vessel or its equivalent, essentially as set forth.

Second, the pan E, arranged and operating in combination with the dasher D, substantially as specified.

63,709.—WM. H. DIBBLE, Bordentown, N. J., assignor to SAMUEL S. WHITE, Philadelphia, Pa.—*Dental Apparatus.*—April 9, 1867.—Improvement on his patent of October 17, 1865. The tongue and cheeks are kept from contact with the teeth of the lower jaw, and the saliva drawn off by an air pump through a perforated tube into a receiver. The air-escape valve is between the receiver and the operative bulb of the pump.

Claim.—First, placing the air valve which allows the escape of air when the pump is compressed below the reservoir which receives the liquids drawn from the mouth, substantially as set forth.

Second, placing the rest which supports the upper jaw upon the same frame which sustains the tongue-holder or plate K, substantially as set forth.

Third, connecting the tongue-holder or plate K directly with the tube which receives the saliva and other liquids from the mouth, substantially as shown.

Fourth, perforating the tube J at any suitable point on that side which is protected by plate K from contact with the tongue, so that saliva and other liquids can be drawn out of the mouth without interruption, substantially as shown.

Fifth, making the apparatus flexible in some convenient part, by inserting a flexible division as in the tube H, or by a joint where the tube is left rigid, substantially as set forth.

63,710.—E. R. DOBBS, Poughkeepsie, N. Y.—*Gate.*—April 9, 1867.—The grooved wheels of the gate run on way rods which are inclined to open the gate by connection to the platforms of the carriage way, which are depressed by the passing carriage. Recoil springs raise the platform and incline the way rods in the other direction, when the gate shuts.

Claim.—The pivoted or adjustable ways D J, with the gate B resting thereon, in combination with the platforms M M, connected with the ways, to operate in the manner substantially as and for the purpose herein set forth.

63,711.—JACOB M. EBY, Warren, Ill.—*Double-shovel Plow.*—April 9, 1867.—The standards have side bends to place them in the proper transverse position in respect to the beam and each other. The fore end of the beam is formed into a hook for the singletree.

Claim.—First, an improved iron double-shovel plow, formed by the combination of the beam A, handles B, standards or supports E, and braces D and G with each other, when said parts are formed and arranged substantially as herein shown and described.

Second, making the uprights or standards E, substantially in the shape herein shown and described and for the purpose set forth.

63,712.—JACOB FICKINGER, Kingsville, Ohio.—*Grinding Mill.*—April 9, 1867.—The fans cause a current of air to flow over the upper stone from the central opening of the curb, and in its passage it is deflected by the caps through the vertical openings in the said stone to the grinding face beneath it.

Claim.—The fans F, cap G, and openings c, in combination with the mill-stones and curb, as and for the purpose set forth.

63,713.—JAMES B. FIELDS, Jersey City, N. J., assignor to himself and PETER FIELDS, same place.—*Quartz Mill.*—April 9, 1867.—The cylinder surrounds the grinding wheel, which is eccentrically journaled in respect to it, and revolves at different speed thereto. The matter to be crushed enters one end of the cylinder, and passes out beneath the shields and ganzo covered openings near the periphery of the same. The cylinder runs on anti-friction rollers.

Claim.—First, the hollow rotating cylinder B, in combination with the crusher G, the latter being placed within the former, and having their crushing or pulverizing surfaces c g, moving with different speeds, by the means substantially as and for the purpose set forth.

Second, the shields E, attached to the inner surfaces of the sides a a of cylinder B, in combination with the openings d in the sides of the cylinder B, covered with screens, and the crusher G, all arranged to operate in the manner as and for the purpose specified.

63,714.—ALBERT FINK, Louisville, Ky.—*Bridge.*—April 9, 1867.—Metallic shoes receive the ends of the wooden braces, and have traversing bolts connecting them by links to the upper and lower string pieces, and on the transverse bolts are also straps connecting them with the braces, and others with the plates which are clamped to the sides of said braces. Each brace consists of two strips to allow the repair of the same, one half at a time, without the necessity of scaffolding.

Claim.—As a new and useful improvement in bridge trusses, the peculiar connection of wooden braces with the upper and lower chords of a bridge truss, by means of cast-iron shoes G H and F, brace straps J K and K, and plates I I and I, for the purpose of forming a firm connection either for the resisting of compressive or tensile strains, substantially as described in the above specification.

63,715.—JOHN GARDNER, Viroqua, Wis.—*Saw Set and Gummer.*—April 9, 1867.—The saw rests upon an anvil and a block. The hammer, with a poll or cutter face is brought down by a cam oscillated by a lever, whose range of motion is governed by an adjustable stop.

Claim.—The cam lever E pivoted to the posts F, rest G, hammer B, spring D, anvil J, and rest I, when all are constructed and arranged upon the bed plate A, as herein set forth for the purpose specified.

63,716.—GEORGE GEER, Galesburg, Ill., assignor to himself, T. G. HADLEY and WILLIAM HAMILTON, same place.—*Cherry Stoner.*—April 9, 1867.—The cherries pass from the hopper down inclined chutes to the cavities where they are consecutively operated upon by the descending forked plungers, which push the stone through the elastic diaphragms, and return with the impaled fruit, which is stripped from them and falls into an inclined discharging trough.

Claim.—First, the rocking shaft and the curved forked plungers with the handle or lever made and arranged and operating in the manner as and for the purpose herein shown and described.

Second, the upright plate for the combined purpose of arresting the downward stroke of the plungers and stripping the cherries from the forks, made and arranged substantially as shown and described.

63,717.—ALEXANDER GORDON, Rochester, N. Y., assignor to H. D. GORDON, same place.—*Cultivator.*—April 9, 1867.—The middle plow has adjustable wings; the rear plows one on each side are pivot-

ed to the cross-bar and are laterally adjustable by brace bars which connect them crosswise to each other.

Claim.—First, the adjustable or swinging clamps *a* in combination with the mold board *B*, for the purpose of holding the wings *v*, substantially as shown and for the purposes specified.

Second, the skeleton metallic cross-bar or tie *C*, constructed as shown and described, and arranged in connection with the shovel and teeth or hoe standards, for the purposes set forth.

Third, the diagonal guide or extension bars *b* in combination with the teeth bars *D*, as shown and described.

63,718.—C. GULLMANN, Poughkeepsie, N. Y.—*Carpet Fastener.*—April 9, 1867.—The lower rod has a roughened surface to bite upon the carpet, and an upper rod covers and protects the lower one, and is itself clamped by curved screw bolts.

Claim.—The combination of the protecting rod *A* and detaining rod *B*, substantially as and for the purpose described.

63,719.—JAMES T. HALL, Trenton, N. J., assignor to himself and JOHN T. and ISAAC PIERCE and H. T. FOWLER.—*Horse Hay Fork.*—April 9, 1867.—Improvement on the patent of John T. Pierce, March 6, 1866. Guards on the cross-head of the spiral tines prevent the elevator ratchet wheel and pawl from catching on the cross-beams or other obstruction in the barn. By pressing down on the cross-head the spiral and straight tines are forced down into the hay, the former revolving in so doing.

Claim.—First, the use of the guards *m* when used in combination with the cross-head *A* and yoke *B*, as herein described and for the purpose set forth.

Second, in combination with the above the pawl *i* and ratchet wheel *C*, when used for holding the tines *J* in a fixed position, as herein described and for the purpose set forth.

63,720.—SAMUEL A. HALLADAY, Marilla, N. Y.—*Stove Pipe Drum.*—April 9, 1867.—The calorific current passes by divaricated flues to the annular flue space in the cylinder, which has spiral plates to compel the currents to sinuous courses therein. The plates around the cylinder form shelves.

Claim.—The inverted hollow arch *A* supporting the heater, its ends connecting the spiral flue *D* with the short pipe *a*, for the passage of the products of combustion, as herein set forth, for the purpose specified.

The ring *G* and the shelves *f* in combination with the flue *C* and the drum *B*, as and for the purposes set forth.

63,721.—HOMER M. HANDY, Miles, Mich.—*Bolt Cutter.*—April 9, 1867.—The handles are pivoted to each other and to the jaws, and the latter are pivoted to each other, forming a double toggle.

Claim.—First, securing the curved and abutting handles *A* and *B* one to the other by means of the plate *a* and *a'* and *b* and *b'* riveted to said handles, and the pivot or journal *c*, all as herein set forth.

Second, pivoting the jaws *C* and *D* to each other by means of the tongue *c* and straps or plates *E* and *F*, substantially as herein shown and described and for the purpose set forth.

63,722.—ABNER S. HARDING and NICHOLAS REED, Otisville, N. Y.—*Combination Padlock.*—April 9, 1867.—The disks are numbered on their peripheries and perforated with central holes and radiating slots for the passage of the bolt. The bolt has an axial bar and radial arms. The arms having passed through the slots in the disks, the latter are disarranged and oppose the withdrawal of the bolt. A screw under the shackle fastens the lid which may be opened to remove and rearrange the disks.

Claim.—The hinged lid *e* of the case *a*, in combination with the screw *g*, shackle *E*, disks *C*, and bolt *B*, constructed and operating substantially as and for the purpose described.

63,723.—M. B. HUDSON, Canandaigua, N. Y., assignor to himself, J. S. ROBINSON and J. G. HUDSON, same place.—*Churn Dasher.*—April 9, 1867; an-

tedated March 1, 1867.—A valve in the form of an inverted funnel slides over upon the dasher rod and socket of the dasher. It is removable for washing, and serves to cover all the openings at the top of the dasher at once, and obviate the use of several distinct valves.

Claim.—The special combination and arrangement of the valve *C*, with the conical dasher *A*, the said valve being situated outside the dasher, and being removable from the dasher and rod, and covering all the ports when in use, as herein set forth.

63,724.—WILLIAM HUNTER, Hastings, Minn.—*Corn Planter.*—April 9, 1867.—The hollow cylinder is of length sufficient to extend over three corn rows, and has within it three parallel rows of hoppers attached 120° apart, and having three hoppers in a row, so as to plant three rows simultaneously, and nine to a revolution. The seed slides are actuated by cam projections and levers.

Claim.—The combination of the hollow cylinder *B*, with the slide bars *c c c*, the hoppers *f f f* and the lever *h*, constructed and arranged for planting corn, substantially as herein described.

63,725.—GEORGE IPE, Kent, Ohio.—*Fence Post.*—April 9, 1867.—The post is stepped upon a rib on the top of the foundation frame, and is bolted to an upward flange of the same.

Claim.—An improved stool for fence posts, made of cast iron, cast solid in one piece, and in substantially the form herein shown and described—that is to say, consisting of the base plate *a*¹, inclined side plates *a*² and top plate *a*³, having flanges *a*⁴ formed upon its upper side, as and for the purpose set forth.

63,726.—THOMAS B. JORDAN, Gloucester, N. J.—*Starting Apparatus for Street Cars.*—April 9, 1867.—A cam is pivoted to an arm, one end of which is bent around the axle, and being connected through a frame and catches to the draft pole, operates upon the tread of the wheel to start the cars when the team moves. The cam drops back after having performed its duty.

Claim.—The combination of the lever *b*, eccentric block *c*, the cord *e*, the sliding cross-bar *f*, the latch *i* and the spring *h*, with the sliding tongue *C*, the car wheels *B* and the axle *A*, arranged and operating substantially as and for the purposes herein described.

63,727.—JACOB J. KAMM, Fort Wayne, Ind.—*Burning Fluid.*—April 9, 1867.—Composed of sulphate of alumina and potassa, 2 drachms; alcohol, 4 drachms; camphor, 1 drachm; potassa, 1 drachm; chloride of sodium, 2 oz.; acetate of lead, 1 drachm; naphtha, 1 quart.

Claim.—The combination of the within-specified ingredients in the manner described, for the purpose of forming an illuminating non-explosive burning fluid.

63,728.—RICHARD KEESE, Bennington, Ohio.—*Churn.*—April 9, 1867.—The revolving dasher rod is stepped in the bottom of the churn box, and its radial dashers are secured by set screws. The wings have a varying obliquity, dividing the cream, and throwing it up, down, or diversely, as may be found most efficient.

Claim.—The adjustable dashers *D E G*, and thumb screws *C*, constructed and arranged in relation to each other, as specified, and in combination with the shaft and body of the churn, operating as and for the purpose set forth.

63,729.—WATSON KING, Springfield, Ill.—*Horse Rake.*—April 9, 1867.—The crank arms upon the axle are extended below the wheel axles, for the purpose of attaching the traces to them to hold the teeth to their work. The thills are hinged to the rear edge of the axle, and the clearer bar is placed above the thills, so as to carry the clearing teeth entirely above the rake teeth.

Claim.—First, extending the crank arms *a* below the axle of the wheels, so that the traces may be attached to these extensions, for the purposes herein shown and described.

Second, the combination with bar *C*, the thills *D*, the cleaning teeth *G* and hinge *c* of the rake head *A*,

all arranged substantially in the manner and for the purpose herein shown and described.

63,730.—W. M. KIRKPATRICK, Littleton, Ill.—*Sash Supporter*.—April 9, 1867.—A rubber cushion is inserted in a recess of the sash, and its outer protruding face engages with the side of the window casing.

Claim.—A sash supporter consisting of a stationary rubber cushion or disk inserted in a recess in either the sash or the frame, with its outer face protruding therefrom sufficiently to press upon the corresponding face of the frame or sash and hold the sash in place, substantially as herein shown and described.

63,731.—W. A. LEWIS, Springfield, Vt., assignor to himself, H. H. MASON, and JOSEPH MESSINGER, same place.—*Mop Head*.—The thread on the handle has its socket in the thumb nut, and the reverse thread on the latter has its socket in the collar of the yoke.

Claim.—The operating thumb nut C, provided with external and internal screw threads, in combination with the fixed screw B on the handle, and the sliding jaw F, substantially as and for the purpose described.

63,732.—WILLIAM LINDSEY, Oberlin, Ohio.—*Cattle Pump*.—April 9, 1867.—The weight of the cattle on the platform depresses the plunger, which is sleeved on the education tube, and forces water upward through the latter. The return motion when the cattle withdraw is made by a coiled spring beneath the plunger.

Claim.—First, the spring C, link b, valve a, and collar D, as arranged in combination with the plunger E, pipe F, and cylinders A B, for the purpose and in the manner as specified.

Second, the sleeve J, platforms L, and arms M, as arranged in combination with the pipe F, plunger E, spring C, for the purpose and in the manner as described.

Third, standards N, links P, arms K, and trough Q, as arranged in the manner and for the purpose herein specified.

63,733.—HENRY LOEWENBERG, New York, N. Y., assignor to himself and EMILE GRANIER.—*Compound for Printers' Ink*.—April 9, 1867.—Explained by the claims.

Claim.—First, a printers' ink made of sirup, molasses, honey or other saccharine substance, in combination with suitable coloring matter, substantially as and for the purposes described.

Second, a printers' ink composed of sirup, molasses, honey, or other saccharine substance, in combination with glycerine or oily matter, or both, and with suitable coloring matter, substantially as and for the purpose set forth.

63,734.—HENRY LOEWENBERG, New York, N. Y., assignor to himself and EMILE GRANIER.—*Marking Compound*.—April 9, 1867.—Iodine or bromine is added to ordinary ink or pigment to render it indelible.

Claim.—A marking compound, either in liquid or solid form, containing iodine or bromine either, or both, substantially as and for the purpose set forth.

63,735.—RUSSEL LOOMIS, Saratoga Springs, N. Y.—*Fire Escape Ladder*.—April 9, 1867.—Two revolving scroll grooved disks act upon the cross-bars on the lower members of the combination toggle or "lazy tongues" arrangement of levers upon which the platform is mounted. The disks are rotated simultaneously by a crank to elevate or lower the scaffold, and the apparatus is mounted on a carriage.

Claim.—The revolving disks D D, having in their sides the scroll grooves c c, the friction rollers i i on the cross-bars d d, and the cap h, in combination with the lazy tongues B, arranged and operating substantially as and for the purpose herein described.

63,736.—JOHN LOW, New Britain, Conn., assignor to himself and WILLIAM NASH.—*Ox-bow Pin*.—April 9, 1867.—The pin passes through the hole in the bow while the semicircular spring is retracted, and then the latter is freed and embraces one side of the bow to prevent accidental retraction of the pin.

Claim.—The construction of the plate a b c, with arm n and spring t, in the manner and for the purposes herein specified.

63,737.—GEORGE W. MCGILL, Washington, D. C.—*Spike*.—April 9, 1867.—Explained by the claims and illustration.

Claim.—First, a spike split into three parts or prongs, the center prong being longer than the side prongs, and said side prongs being so beveled that on being driven into the wood they will spread and diverge from the center prong in opposite directions, while the said center prong goes down into the wood perpendicularly, substantially as shown and described.

Second, a spike split into three parts or prongs throughout the whole extent of the shank that is to be driven into the wood, with the side prongs beveled as described, so that the spike may be driven into the wood and the side prong made to spread and diverge without boring, substantially as described.

63,738.—JOHN MERLETT, Round Brook, N. J.—*Spike*.—April 9, 1867; antedated April 1, 1867.—The spike has wedge-shaped projections whose shoulders project wholly beyond the surface of the shank. A collar around the spike near the head has a cutting edge, which trims the fibers of the wood around the hole and wedges into it to make a water-tight joint.

Claim.—First, the wedge-shaped ribs c d, forming shoulders c' d' at their upper ends and arranged upon the lower portion of the spike, substantially as herein set forth, for the purpose specified.

Second, the lug g, constructed with cutting edge n' and with inclined sides g', in combination and arranged in relation with the wedge-shaped ribs c d and with the body of the spike, substantially as herein set forth, for the purpose specified.

63,739.—J. H. MOORE, Warren, Mass.—*Carriage*.—April 9, 1867.—Mounted on the coupling bars are long backwardly-extending spring bars; thorough braces extending from the ends of the bars to the fore axle support the seat and body.

Claim.—The combination of the carriage body, its seat, thorough braces, springs, and perches, when arranged with respect to the fore and hind axle of a carriage, substantially as shown and described.

63,740.—S. L. MYERS and GEORGE WILLISON, Massillon, Ohio.—*Machine for Polishing Wagon Spokes*.—April 9, 1867.—The emery wheel rotates on its vertical axis and the spoke is held by a chuck which is rotated by a hand crank and is also capable of a longitudinal reciprocation. The spoke holder is attached to a hinged portion of the frame so as to be brought up to or away from the wheel.

Claim.—First, the board D, pivoted at d, to the frame A, and having the braces I I, sliding shaft G, with arms H H, the latter bearing the chuck K, and crank L, when all are constructed and arranged in such a manner that the operator may, when desired, impart a combined revolving, vibrating, reciprocating motion to the spoke, substantially as herein set forth.

Second, the concave horizontal table C, covered with an elastic cushion upon which the polishing material is placed, when constructed and operating as herein set forth for the purpose specified.

63,741.—JACOB K. NELSON, Greenpoint, N. Y.—*Screw Cutter*.—April 9, 1867.—The revolvable head has radial bearing blocks or cutters which are adjustable from the outside.

Claim.—In combination with the revolving head B, the detachable socket D, fitted with loose or detachable blocks F F G or H, forming chasers, cutters, steadying blocks, or grippers, and made capable of radial adjustment from the outside of the revolving head of the hand tool or wrench, substantially as and for the purposes herein set forth.

63,742.—JAMES O'KANE, New York, N. Y.—*Dies for Forming Hinges*.—April 9, 1867; antedated April 1, 1867.—The hinges are made in long continuous strips, and are afterwards cut apart. The draw plate has slits for the wings on each side of and communicating with a circular groove in which the flanges are closed around the pintle.

Claim.—The two communicating slits or channels r r, arranged with reference to the circular groove s of a draw plate, as and for the purpose set forth.

63,743.—DWIGHT J. OSBORN, Windsor Locks, Conn.—*Sash Supporter*.—April 9, 1867.—The lever has two arms to which are pivoted two bolts for the purpose of locking either one or both of the sashes, in any position to which they are adjusted; the handle is moved in an upward, downward, or lateral direction to effect the required engagement or free either or both the sashes.

Claim.—First, the arrangement upon the plate A, of the part B, operated by the handle D, in combination with the pieces c c, having projections upon them for the purpose of entering and supporting the sashes, substantially as set forth.

Second, in combination with the supporter constructed as above, the piece G, for fastening the handle D, substantially as set forth.

63,744.—ISAAC OSGOOD, Utica, and ALEXANDER MUNROE, German Flats, N. Y.—*Apparatus for Dyeing, Bleaching, and Washing, and Drying Yarns and Thread*.—April 9, 1867.—The thread is wound in the form of bobbins on a hollow perforated cop tube which is placed over a short tube through which the liquid to clean or dye the yarn is pumped, passing through the perforated stem and the yarn wound thereon. Cleansing, bleaching, or dyeing liquid may be forced through, followed by dry air or steam.

Claim.—First, the apparatus for dyeing, bleaching, or cleansing threads or twists of any fibrous material, consisting of the perforated metallic bobbins or cop tubes when used in combination with the tanks C and D, force pump E, pipes b and e, and vertical pipes r, the whole arranged and operating substantially as described.

Second, the use of a perforated cop tube in combination with a perforated cop-sheath, substantially as set forth.

Third, the method of dyeing, bleaching, or cleansing threads or twists of any fibrous material, substantially as hereinbefore described.

Fourth, as an article of manufacture a perforated metallic bobbin consisting of stem n and base m, when constructed substantially as described.

63,745.—EDWIN and THOMAS S. PARKER, Schenectady, N. Y.—*Steam Engine Slide Valve*.—April 9, 1867.—The steam passes through apertures in the roof of the valve to nearly equalize the pressure above and below.

Claim.—In the valve B, constructed substantially as herein shown and described with the cavity C, the apertures c c, as and for the purposes set forth.

63,746.—B. F. PRASLEE, Lake Village, N. H.—*Knitting Machine Needle*.—April 9, 1867.—The journal being of the same piece as the latch cannot work loose, and thus be liable to injure the work or the needle.

Claim.—Forming fixed journals a a, on the latch of the needle, substantially as and for the purpose herein specified.

63,747.—J. B. PETTEY and JEROME FREDERICKS, Conneaut, Ohio.—*Stuffing Box for Deep Well Pumps*.—April 9, 1867.—The packing box is expanded by its enclosed divided sections, which are driven apart by the revolution of a conical-threaded enlargement on the tube.

Claim.—First, an elastic stuffing box for oil wells formed of a rubber cylinder cased in leather, or its equivalent, combined with a hollow taper screw forming part of the well tubing and working in a female screw within the cylinder divided into two or more longitudinal sections, constructed and operating substantially as and for the purpose herein described.

Second, the perforated collar f, placed on the tubing below the stuffing box, and the washer g, on the screw e, above the stuffing box in combination therewith, constructed as and for the purposes herein described.

63,748.—JOSHUA REGESTER, Baltimore, Md.—*Faucet*.—April 9, 1867.—On the handle on the disk valve stem is a flange or hood which comes in contact with the sides of the faucet and limits the motion of the valve.

Claim.—In combination with the perforated disk valve d, cut-off plate b, and longitudinal stem e, hav-

ing two bearings b and g, the construction of the handle C, with a flange h, adapted to operate substantially as described.

63,749.—THOMAS RESTIEAUX, Boston, Mass.—*Deodorizing Petroleum*.—April 9, 1867.—Nitrate of mercury is applied to petroleum to remove the peculiar odor of the latter.

Claim.—The application of quicksilver to petroleum and any of the products of petroleum as herein described, using for that purpose the aforesaid solution, or any other substantially the same and which will produce the intended effect.

63,750.—C. M. REYNOLDS, Champaign, Ill.—*Car Coupling*.—April 9, 1867.—The sides of one draw head have pivoted jaws pressed in by springs; and the other draw head has an arrow-headed tongue whose sides are furnished with springs to keep the tongue central when released, so that it may be drawn out without catching the sides of the draw head.

Claim.—The arrangement of the bumpers A A', constructed as described, with the jaws C C, springs b b, and cam D, when used in combination with the draw bar B provided with springs a a, and connected to the bumper A by the pin T, as and for the purpose herein specified.

63,751.—M. S. ROBERTS, Lewiston, N. Y.—*Peat Machine*.—April 9, 1867.—The conveyor frame is made in three sections, the upper one resting upon the top of the framework; the others being hinged so as to be raised or lowered to bring the buckets into the proper position to dig the peat. The buckets are carried by an endless band from the peat bed to the top of the machine, where their contents are discharged into a disintegrating mill, from whence the peat passes between pressure rollers, and falls into a trough, which carries it forward and distributes it upon the ground to be dried.

Claim.—First, the so hanging and arranging the outer section of the conveyor frame to its main portion that it can be raised or lowered, and set at any desired angle with regard thereto, substantially as and for the purpose described.

Second, forming the bottom of the mill of a series of knives or cutter blades fixed in a common revolving frame in combination with the partition or plates hung across such portion of the mill, substantially as and for the purpose described.

Third, the fixed partition plate of the mill in combination with the side opening thereof, substantially as described for the purpose set forth.

Fourth, the arrangement of a series of scrapers in the bottom box of the mill as and for the purpose described.

Fifth, the open endless distributor, having a series of partitions or cross plates, in combination with the bottom of the frame in which it moves, substantially as and for the purpose described.

63,752.—ADAM ROSENBERGER, Brandonville, W. Va.—*Hand Loom*.—April 9, 1867.—The described devices are for the purpose of shifting and adjusting the harness.

Claim.—First, the combination with the roller P, staples G, and pivoted frame Q, of the hooks H i, treadles G, attaching pieces F, and levers S S, all constructed and arranged in the manner described and employed to effect the shifting of the harness, as set forth.

Second, in combination with the above, pendant K, thumb screw L, pulley J, and cords e, arranged as described and employed for adjusting the harness as specified.

63,753.—E. P. RUSSELL, Manlius, N. Y.—*Gridiron*.—April 9, 1867.—The two sections are hinged so as to maintain a rectangular position when required. The bars of each one cross the other at right angles; the sides being equally open and adapted to set above a stove pipe opening.

Claim.—The two halves A C and B D, when constructed so that the bars of one-half shall cross the bars of the other, and when combined and arranged with the square heeled hinge E F, operating as described so as to form a reversible gridiron.

63,754.—HENRY SAWYER, Boston, Mass.—*Starch Gloss.*—April 9, 1867.—Paraffine is used in combination with starch to give linen a glossy appearance.

Claim.—The use or employment of paraffine in combination with starch substantially in manner and for the purpose as before described.

63,755.—LEVI C. and JOHN M. SCHERMERHORN, North Gage, N. Y.—*Milk Vat.*—April 9, 1867.—Steam and water pipes are introduced between the exterior and the interior vats to regulate the temperature of the contents of the latter.

Claim.—The perforated steam and water pipes introduced into the space between the exterior and interior vats, for the purpose of heating regularly with steam, and instantly (when necessary) shutting off the steam and applying jets of cold water to cool the contents of the inner vat, by means and for the purposes herein described.

63,756.—A. D. SCHNACKENBERG, Brooklyn, N. Y.—*Portable Soda Fountain.*—April 9, 1867.—The body is made of cast iron lined. The valve is conical and fits into the valve seat without packing.

Claim.—Closing the end of the high pressure tube *b*, directly with a conical plug *B*, without the use of a leather or other washer or packing for the valve, all made and operating substantially as and for the purpose herein shown and described.

63,757.—ELIJAH C. SEARS, Crystal Lake, Ill.—*Farm Gate.*—April 9, 1867.—The gate is held in position by guides, and slides between anti-friction rollers on the fence post.

Claim.—First, in the construction of a board gate the arrangement of the double guide *e*, and the friction rollers *g g'* in the rear cleat *b*, in combination with the upper board *d* of the fence *A*, operating as herein described.

Second, the single guides *m m'* at the top and bottom of the cleat *k*, in combination with the roller *g*² and the upper and lower boards of the gate *B*, arranged and operating as herein set forth.

Third, the notch *i*, in the center post *h*, to clear the double guide *e*, when the gate is opened or closed, as herein specified.

63,758.—J. S. SILLS, Cedarville, Ill.—*Washing Machine.*—April 9, 1867.—Two semicircular sections which fit the bottom of the tub are attached by a series of parallel, rounded slats. A circular rubber board has similar slats, a corrugated plate above, and a handle at each side by which a rocking or vertical motion can be given.

Claim.—The corrugated board *I*, in combination with the upper rubbing board *E*, having the slats *D*, rim *G*, handles *F*, the lower rubbing board consisting of the semicircular boards *A* and slats *B*, substantially as herein set forth for the purpose specified.

63,759.—DAVID M. SMITH, Springfield, Vt.—*Clothes Pin.*—April 9, 1867.—The wooden key has slotted cylindrical heads which enter grooves in the respective jaws and form a hinge. They are retained by pins.

Claim.—The wooden key *B* for connecting the two jaws *A*, consisting of the central piece *d*, having slotted cylindrical ends *e e*, held in place by means of the pins *e e*, as herein shown and described.

63,760.—LEWIS W. SPENCER, New York, N. Y., assignor to SCHREIBER CORNET MANUFACTURING COMPANY, same place.—*Machine for Forming the Branch Tube of Valve Cases for Cornets.*—April 9, 1867.—The chuck has a sliding plate adjusted laterally by a screw, and to which a circular plate is pivoted whose axis is at right angles to that of the mandrel. The blank is secured to the circular plate and the tube blanks brought one at a time in line with the sliding drill and drilled out. A pin holds the plate in position. A turning tool is then attached to the sliding drill rest to dress the outsides.

Claim.—The combination of the mandrel, the slide on the chuck of the mandrel, the index plate with its spindle at right angles to the axis of the mandrel and also to the slide, and the sliding stock or tool holder, substantially as and for the purpose described.

63,761.—LEWIS W. SPENCER, New York, N. Y., assignor to SCHREIBER CORNET MANUFACTURING COMPANY, same place.—*Machine for Forming the Bells of Cornets.*—April 9, 1867.—The blank is placed on the "former" and forced down with the leaden disk into the die by turning the sleeve nut of the "former" shaft.

Claim.—The combination of the die, the leaden or equivalent disk, the former, and the follower, substantially as and for the purpose described.

63,762.—CHARLES STARBUCK, Philadelphia, Pa.—*Cam Hitching Hook.*—April 9, 1867.—The eye of the hook and its mousing are both contained in the same loop so as to be closed positively when strain is applied. They are opened by spreading the eyes like handles of shears.

Claim.—The construction and application of the cam lever *A'* so that it will operate in combination with the main portion *A* of the hook, substantially in the manner described for the purposes specified.

63,763.—GEORGE STEVENSON, Zionsville, Ind.—*Grain Cleaner.*—April 9, 1867.—A stationary cam on the casing acts in combination with the spring attached to the rubber bar to effect the independent vibrating movement of the latter while the screen revolves.

Claim.—The stationary cam disk *C* and the spring *I*, in combination with the screen *B*, for operating the rubber bar *n*, arranged substantially as herein described.

63,764.—JAMES W. SUIDTER, Sharon, Wis.—*Portable Fence.*—April 9, 1867.—The panels overlap each other, and are attached and supported by interlocking braces mounted upon interlacing braces mounted upon subordinate cross braces, which are staked to the ground.

Claim.—The portable fence constructed with panels *A*, cross braces *B*, and foot pieces *C*, with or without the pin *D*, said parts being respectively constructed, and the whole combined substantially as set forth.

63,765.—W. TASH, Berlin, Ill.—*Wagon Brake.*—April 9, 1867.—The wagon box rests on grooved rollers which run on guide bars beneath the box when descending a hill, thereby drawing the rod which is attached to the box at one end and the brake lever at the other, and regulating the friction of the brake by the grade of the hill.

Claim.—The rollers *s s* upon the guide rods *g g* of the bolster *d*, in combination with the guide bars *s s'*, box *A*, substantially as herein shown and described.

63,766.—HIRAM THOMPSON, Worcester, Mass.—*Machine for Shaping and Heading Bars of Metal.*—April 9, 1867.—The blank is placed between the dies in the lower roller, and the moving die is forced to its fellow by a knuckle joint operated by the pressure of the upper roller, which also finishes the head as it passes beneath it. The dies are opened by fixed cams which engage pins playing in radial slots of the roller, which also finishes the head as it passes beneath it. The dies are opened by fixed cams which engage pins playing in radial slots of the roller and connected to the middle pivot pin of the knuckle joint.

Claim.—First, the arrangement for giving motion to the jaw *a* and die *f* of the knuckle joint *b* and wheel *B*, as described.

Second, the combination with the revolving wheel *A*, jaw *a*, and die *f* of the wedge *o*, and set screws *l* and *2*, said parts being constructed and arranged for operation substantially as and for the purposes set forth.

63,767.—JOHN ROBERT WALLACE and BENJAMIN A. McCLAIN, Murfreesboro', Tenn.—*Cotton Cultivator.*—April 9, 1867.—The two shares in front of the machine are attached to pivoted rods which are adjusted by a chain connecting with the frame. They can be raised out of the ground by a lever within reach of the driver. The rear cutter wheel rotating in a plane transverse to the line of motion of the frame, is driven by gearing from the main axle and chops gaps in the row, leaving it in hills.

Claim.—The scrapers or shares *H* arranged or applied to the front part of the machine, so as to be ca-

pable of being adjusted higher or lower to penetrate a greater or less depth into the soil, and also capable of being raised entirely therefrom, substantially as set forth.

63,768.—ALEXANDER WARNER, Brooklyn, N. Y.—*Window Blind Fastening*.—April 9, 1867.—A bolt on one of the slats engages one of a semi-circular series of holes in a plate attached to the stile.

Claim.—The slat fastener consisting in the combination of plates *b* and *b'*, when provided with holes or recesses, the bolts *a* and *a'*, substantially as and for the purposes herein shown and described.

63,769.—W. T. WELLS, Decatur, Ill.—*Gate Latch*.—April 9, 1867.—The gate bolt is moved longitudinally by raising or releasing the gravitating handle to which it is pivoted, and which is itself pivoted to the stile of the gate.

Claim.—An improved gate latch formed by the combination of the adjustable bolt *D*, and pivoted lever handle *F*, with each other and with the frame of the gate *B*, substantially as herein shown and described.

63,770.—D. M. WESTON, Boston, Mass.—*Centrifugal Machine for Draining Sugar and other Substances*.—April 9, 1867.—The cylinder is suspended by a revolving shaft which permits lateral motion. The bottom of the cylinder has a series of apertures through which the sugar is discharged. When the machine is in operation, the apertures are closed by a valve and the water driven through the foraminous periphery.

Claim.—The construction of centrifugal machines made to separate liquids from other substances, by suspending such machine at the tops by flexible connections, operating substantially as above described.

Also, the construction of the openings *i i i i* in the bottom of the cylinder *g* in such machines and the valve *j*, for the purpose and operating substantially as above described.

63,771.—GEORGE H. WHITE, Huntington, N. Y.—*Load Scraper*.—April 9, 1867.—The scraper is supported on two castor wheels and adjusted vertically by a spur wheel and rack.

Claim.—First, the scraper plate *A*, constructed substantially in the form and manner herein shown and described.

Second, the combination of the pivoted castor wheels *E* with the scraper, substantially as herein shown and described and for the purpose set forth.

Third, the combination of the pinion wheels *J* and racks *I*, with the pivoting blocks *D* of the wheels *E*, substantially as herein shown and described and for the purpose set forth.

63,772.—ANTHONY L. WHITNEY, Brooklyn, N. Y.—*Steamer for Culinary Purposes*.—April 9, 1867.—The kettle with perforated bottom sets into the outer kettle while boiling, and for steaming is supported by a perforated pan resting on the rim of the kettle.

Claim.—The combination of the vessels *A B* and *D* with each other, substantially as and for the purpose herein shown and described.

Also, the intermediate vessel or pan *D*, made and operating substantially as and for the purpose herein shown and described.

63,773.—BAXTER D. WHITNEY, Winchendon, Mass.—*Machine for Grinding Saws*.—April 9, 1867.—The revolving grindstone or wheel is brought in contact with the surface of the cylindrical saw which slowly revolves and traverses longitudinally from end to end, when its motion is reversed by suitable mechanism. The saw mandrel has a friction roller and gauge, and the grinding wheel is adjustable in position.

Claim.—Reducing the plates of cylindrical saws to an even and uniform thickness, by means of the sliding frame *B*, on which the saw *E* is supported, revolved and moved laterally by the action of the reversible screw *L*, slide *P* and lever *M*, in combination with the grindstone or grinding wheel *K*, ar-

ranged and operating in the manner substantially as herein described for the purposes set forth.

63,774.—WM. WICKERSHAM, Boston, Mass.—*Egg Beater*.—April 9, 1867.—The segment gear worked by the crank connects with a pinion to oscillate the beater.

Claim.—The device in egg beaters of giving the segment gear, and consequently the beater knives *e e c c*, a vibrating motion by means of a crank and connection rod frame, and arranged as described.

63,775.—JOHN P. WRIGHT, Canton, Minn.—*Scaffold*.—April 9, 1867.—The platform has nuts engaged by the vertical screw, by which it is raised or lowered, and this screw is turned by a winch below and by a hand wheel resting on the platform and sliding up an angular shaft which carries a bevel wheel engaging a similar one on the main screw. When extended, the ends of the scaffold are connected to smaller platforms supported on the ratchet posts, and which are raised and lowered by cords, which pass over sheaves at the post heads.

Claim.—First, the arrangement of the posts *P P*, with the platforms *o*, in combination with the screw shaft *E*, substantially as described.

Second, the shaft *L* and bevel wheel *M*, in combination with the shaft *E* and nuts *N N*, substantially as and for the purposes set forth.

63,776.—N. A. WRIGHT, Prairie DuChien, Wis.—*Book Holder for Pews*.—April 9, 1867.—The spring ends of the holders are attached to the backs of the pews, and the free ends of wood or metal are of convenient form to sustain books, hats, &c.

Claim.—The spring holder *C*, when adjustable through the slot *a*, in the socket *H*, to regulate the tension of the spring, when combined and arranged as and for the purpose specified.

63,777.—ISAAC B. WIGGIN, Washington, D. C.—*Burning Fluid*.—April 9, 1867.—Composed of naphtha, 40 galls.; kerosene oil, 2 galls.; gum camphor, 1 lb.; gum turpentine, 1 lb.; oil of lemons, 1 oz.; oil cloves, 1 oz.; and the tri-phosphate of soda and ammonia, commercially termed microcosmic salt, 4 oz.

Claim.—The incorporation of microcosmic salt with the above-named compound of hydrocarbons, reference being had to the use of denser materials, both in the composition of the hydrocarbons and the microcosmic salt, so as to make a fluid that can be burned in any kind of lamp, without smoke, bad odor, or danger of explosion.

63,778.—Canceled.

63,779.—AARON C. ANDREWS, New Haven, Conn.—*Uniting India-rubber with Leather*.—April 16, 1867.—By forming grooves at the points of junction the surface in contact is extended to form a more perfect union.

Claim.—Uniting india-rubber to leather or other material by forming grooves or creases in such material, into which the rubber is pressed previous to vulcanizing, as and for the purposes specified.

63,780.—ASA BEE, White Oak, West Va.—*Saw Mill*.—April 16, 1867.—The clamp plates of the saws have guide rollers whose grooved peripheries run on V-edged reversible plates. The lower saw guides have clearers to prevent the sawdust from entering between the guide rollers and the guides. The feed is caused by levers and adjustable springs connecting the upper sash bar to a gripping rod operating the feed wheel.

Claim.—First, the application of the guide rollers *N*, or their equivalents, to the stirrups *J*, substantially as and for the purpose specified.

Second, the V-shaped adjustable and reversible guide bars *O*, when constructed and applied substantially as and for the purposes set forth.

Third, the clearers *P*, when constructed and applied in the manner and for the purpose explained.

Fourth, the combination of the springs *T T*³ *T*⁵ and lever *T*¹, when constructed and operating as described, to communicate motion from the saw sash to the grip iron.

Fifth, the spring T³, when constructed and made adjustable in the slotted lever T¹, in the manner specified for the purpose of changing the feed, as described.

Sixth, a grip iron, when constructed with adjustable gripping blocks V¹ V², substantially as and for the purpose specified.

Seventh, the adjustment of the blocks W¹ W², by means of the arm X and clamp Y, as and for the purpose described.

63,781.—HENRY M. BIRD, Cambridgeport, Mass.—*Mold for Pipe Casting.*—April 16, 1867.—Improvement on the patent of George T. Sheldon, April 3, 1866, (No. 53,690.) The annular supporting flanges support the sand molds and cores, which prevent the contact of the hot metal with any chilling surface.

Claim.—The combination as well as the arrangement of two or any other suitable number of the flange-finishing and core-supporting flasks D, provided with masses E of molding sand, or its equivalent, with a pipe mold A B and its core C, the whole being substantially as and for the purpose described.

63,782.—GEORGE S. CALDWELL, Syracuse, N. Y.—*Harness Buckle.*—April 16, 1867.—The two toothed jaws in the opposite edges of the frame have pins resting in inclined slots; when the strap is applied between the jaws the drawing action on the strap will close the jaws upon its edges.

Claim.—The combination and arrangement of the buckle as herein set forth, viz., with the toothed jaws B B, resting in the edges of the frame, and bearing upon the edges of the tug or strap by means of the pins and inclined slots i k, or equivalent, as specified.

63,783.—NEIL CAMPBELL, Brooklyn, N. Y., assignor to himself and WILLIAM FRAIZER, same place.—*Axle Box.*—April 16, 1867.—The removable base is held by dovetail flanges and the solid springs are confined in place between brackets on the axle boxes and the top plates of the pedestals. The arm of the axle in the oil chamber of the box has enlarged removable sleeves secured by lugs in conjunction with a collar and key.

Claim.—First, the flanges a a' on the exterior of the pedestal, in combination with the grooved and shouldered removable base plate C, substantially in the manner and for the purpose described.

Second, the removable base plate, constructed so as to be applied as described and also with sockets to receive a tie rod and end braces D D, substantially in the manner shown and described.

Third, the combination of the brackets E', studs d d', and solid springs F F, substantially in the manner and for the purpose described.

Fourth, the combination of the enlarged sleeves K with a grooved face bearing block H, having flanges l l, substantially as described.

Fifth, the lugs h h, collar i, and pin j, in combination, as a means for securing a removable sleeve K to the arm of a railroad car axle, substantially as herein described.

Sixth, the box E, with brackets E' on its sides and the pedestal with semi-cylindrical chambers and with a cap A, so that solid springs F F may be employed and confined in place by means of the removable base plate C, all substantially in the manner described.

63,784.—CHARLES COLLIER, Charlestown, Mass.—*Machine for Making Drain Water Pipes.*—April 16, 1867.—The clay cylinder is connected with a hydraulic cylinder, which, operating the plunger, ejects the tile from the receiver. The plunger when revolved by its handles is run back on its shaft, allowing the cylinder to assume a vertical position for re-filling.

Claim.—A clay cylinder or receiver B, in combination with an hydraulic cylinder operating a piston or plunger D, for ejecting the clay from the receiver in the required form for a pipe or tile, substantially as described.

Also, connecting the head or plunger D with the piston E of the hydraulic apparatus, by means of a screw e, so that it may be moved toward and from the clay-cylinder by hand, for the purpose specified.

63,785.—GERMOND CRANDELL, Washington, D. C.—*Paper File.*—April 16, 1867.—One end of the wire is a point and the other a socket to receive the former.

The hinge is a coiled spring and it is manipulated by pressure on projecting arms.

Claim.—A bill and paper file made as herein described, or its substantial equivalent.

63,786.—MICHAEL DECAMP, South Bend, Ind.—*Millstone Feed.*—April 16, 1867.—The upper end of the damsel is angular and enters a similar axial bore of a sleeve topped by a horizontal circular disk. A rectangular-ended shaft standing vertically and axially in the hopper enters and receives motion from this sleeve, and has at top a pulley communicating by a belt to the fan shaft. The fan causes an exhaust of air at the point of grain discharge from the revolving disk, and draws out the impurities.

Claim.—First, the separator, constructed and operating substantially in the manner herein described, and applied in the relation substantially as shown and described to the millstone feeder and the eye of millstones, for the purpose set forth.

Second, the construction of the mouth of the separator, in the manner substantially as shown and described, so that the separator is adapted to be applied to a mill, and to operate substantially as described, for the purpose set forth.

Third, the arrangement of a millstone feeder and a separator in the relation to one another substantially as shown and described and for the purpose set forth.

Fourth, the raised step e e', arranged on an inclined support and in relation to the inclined partition b and the passage d, substantially as and for the purpose described.

63,787.—HERMAN EHL, Utica, N. Y.—*Sash Supporter.*—April 16, 1867.—Vertical bars attached to the sash slide in metallic collars imbedded in the frame; thumb screws engage the bars to maintain the position of the sash.

Claim.—The employment and use of one or more rods or bars C, attached to the sash and operated substantially as described.

Also, in combination with said rods or bars C and sash B, the nuts or disks D and thumb screws E, the whole being attached and operated substantially in manner described, for the purpose mentioned.

63,788.—GEORGE EICHENSEER, Waterloo, Ill.—*Threshing Machine.*—April 16, 1867.—The fore end of the machine is vertically adjusted by the screw-threaded king-bolt and side bolts. The driving pulley is vertically adjusted by the movement of its step plate upon inclined slides. This pulley has a pawl connection to the shaft, which permits the machinery to run when the belt is stopped. The cylinder has end disks of metal and teeth to clear the space between them and the sides of the feed chute. The grain slides into the discharge chute from an adjustable pivoted plate, and receives the impact of the wind, which is guided by an adjustable deflecting plate. At the chaff discharge, the heavier parts pass into a trough having an under branch leading to the feed chute, and furnished with a valve, which when closed forces the matters into the other and waste branch. The threshing cylinder is adjusted longitudinally by screws at the ends of its shaft.

Claim.—First, the combination of the screw bolts a and a', substantially as and for the purpose set forth.

Second, the combination of the shaft e, its bearing block e² and sliding bar e³, the ways e⁴ with the screw bar e⁵ and handle nut e⁶, all acting substantially as and for the purpose set forth.

Third, the combination of the pulleys e¹¹ and e¹², for packing the driving band D, substantially as and for the purpose set forth.

Fourth, the cutter teeth h² for cleansing the crevices between the flanges h³ and the feed plate h⁴, as set forth.

Fifth, the application of the drop guide plate k⁵, as set forth.

Sixth, the combination of the conduits o³ and o⁴, with the door o⁵, substantially as and for the purposes set forth.

Seventh, the combination of a feed plate h¹, arranged for vertical adjustments, with the threshing cylinder h², arranged for lateral horizontal adjustment, substantially as set forth.

Eighth, the combination of the separators k¹ k², with the return feed plate k³, chaff discharge plate k⁴

and guide drop plate *k*⁵, all with the air currents adjusted and directed by the vane *p*⁴, substantially as set forth.

63,789.—JOHN ELLIS, New York, N. Y., and EDWARD C. KATTELL, Binghamton, N. Y.—*Apparatus for Distilling and Refining Petroleum, &c.*—April 16, 1867.—The oil passes through a coil in the upper condenser into the still, which is charged with steam by a pipe. The lighter portions of the oil are volatilized, and pass from the still to the condenser. The heavy portions of the oil pass into a tank and through a coil into the retort, heated by superheated steam. The vapors from the retort pass through one condenser into another, and the refuse oil escapes through a tube. The residuum passes into a still, where it is again subjected to heat, the vapors passing to a condenser.

Claim.—First, the using of steam and superheated steam for the purpose of separating and removing the more volatile from the less volatile portions of petroleum, kerosene, benzine, naphtha and turpentine, while these fluids are in a state of spray or drops, as specified.

Second, the oil pipes E and K and condensing tubes D and I, when constructed and arranged in relation to each other, and a retort as and for the purpose specified.

Third, the separating tank, tub or tube, in combination with an upper and under retort, for the purpose of separating the water and earthy impurities from the oil before the latter flows into the lower retort.

Fourth, the using in a retort scraps of metal wire, wire sieves, nails, turnings, or other metallic or earthen materials, or even vegetable substances, which will either form a screen or a porous mass through which oil can trickle down, so as to expose a large surface of it to the action of heat.

Fifth, the using in a retort or retorts of a series of nearly or quite horizontal plates, shallow pans or shelves, which may lie concave or with edges turned up, plain or convex, perforated with from one to numerous openings, or without any openings over which oil can flow or drop, or run from point to point, in combination with the pipe I and coil K, so as to expose a very large surface to the action of steam, and to form a very large evaporating surface.

Sixth, the using an agitator in a circular or nearly circular retort, for the purpose of throwing the oil into a spray or drops, so as to expose every drop as far as possible to the direct action of heat, and allowing the oil or fluid being distilled to flow through the retort in a steady stream, but not to accumulate in any considerable quantity in the retort, substantially as represented in the drawings.

Seventh, the condensers A M and Q, containing internally plates, disks, turnings, or an agitator into which the vapor of oil and cold water are allowed to flow for the purpose of condensing the vapor, substantially as represented in the drawings and described in the specification.

Eighth, the blowing the inflowing oil into a state of spray by a current of steam, by allowing the steam to strike the stream of oil, substantially as is represented by the oil pipe *u* and the dotted steam pipe *t* in the drawings of retort L.

63,790.—DANIEL FITZGERALD, New York, N. Y.—*Bed Bottom.*—April 16, 1867.—The elastic cord is passed and repassed through the holes or slots of the rail from end to end, its loops serving to support the end of the slat.

Claim.—The bar B, provided with holes or openings, cut directly through it from side to side, when used in combination with an elastic or other band or cord passed through said openings, in the manner represented, for the purpose of forming a reversible bed bar, which will support the slats when either side is down, substantially as herein set forth.

63,791.—J. C. GASTON, Cincinnati, Ohio.—*Churn.*—April 16, 1867.—The hollow hub of the dasher has radiating arms; a guard plate secured by pendants to the lid, obstructs the egress of cream, while it permits the free ingress of air.

Claim.—First, in the dasher the inverted cup-shaped hub E, the cavity *b* being cylindrical, and two

or more series of radial arms F, secured to the exterior of the hub E, all constructed substantially as above described, and for the purpose specified.

Second, in combination with the lid B, which has the enlarged central perforation *a*, the guard plate *c*, pendants *b* and blocks *c*, arranged substantially as and for the purpose above described and set forth.

63,792.—G. GREGORY and F. B. MORSE, New Haven, Conn., assignors to themselves and W. H. COOPER, same place.—*Joint for Carriage Top Brace.*—April 16, 1867.—A stud is attached to one car and a corresponding recess on the other to secure the connecting screw from strain.

Claim.—The herein described stump joint, as an improved article of manufacture, consisting of the two parts A and B, upon the ear of one of which is formed a stud *a*, and in the other a corresponding recess, so that the said stud forms the bearing or pivot for the joint, substantially as herein set forth.

63,793.—WM. HALL, Dubuque, Iowa.—*Machine for Forming Tubes of Sheet Metal.*—April 16, 1867.—The blank is laid upon the grooved underplate beneath the mandrel, and the hinged plate forced over it to curve the blank; the edge of the latter entering the longitudinal slot. The mandrel is revolved as many times as desired.

Claim.—First, the grooved plates A *a*, hinged together and operated as and for the purpose set forth.

Second, the slotted mandrel F, in combination with gear wheels C C, arranged and operating as described.

Third, in combination with the grooved plates A *a*, the sliding straight-edged bar H H, with its elevated projecting flange, as operated and described.

Fourth, the sliding frame G G, with its clamping device *b b* and wheels *d d*, in combination with the inclined plane *m m*, operating substantially as described and for the purpose set forth.

Fifth, the combination and arrangement of the plates A *a*, mandrel F, gear wheels C, sliding frame G, with its parts *b b*, inclined plane *m m*, and sliding bar H H, with projecting flange, substantially as and for the purpose set forth.

63,794.—JOHN A. HEYL, Boston, Mass.—*Railway Switch.*—April 16, 1867.—The four-crank shaft has its two end cranks connected by rods to the toggles, which are pivoted to the rails. A wheel on the locomotive has lateral movement to accommodate it to either of the two inclined levers on the central cranks, which operate to connect the switch with either track.

Claim.—The arrangement of the bars I I, the cranked shaft G, the connecting rods H H, the lever E, the toggles F F, the connection bar D, the whole being applied to the switch, and so as to aid in operating it in manner and under circumstances substantially as hereinbefore explained.

63,795.—WALTER HUBBARD, Meriden, Conn.—*Table Cutlery.*—April 16, 1867.—The handle and blade are cast together, after which the carbon is eliminated from the iron, converting it into malleable iron.

Claim.—The solid-handle cast metal knife herein described, the same being a new article of manufacture.

63,796.—ORANGE D. HUNTER, Terryville, Conn.—*Ox Bow Pin.*—April 16, 1867.—The engaging bolt slides in a segmental groove, and its projection is secured by a drop pawl, which may be raised through a perforation in the slide plate beneath it.

Claim.—Securing the bolt *e* on the plate *b* by means of the prongs *c*, in combination with the drop latch *h*, substantially as and for the purpose described.

63,797.—A. B. HURD, Watkins, N. Y.—*Uniting Stove Pipes, &c.*—April 16, 1867.—The coupling is secured by projections on one pipe running in a groove round the other, or they are fastened by narrow projecting beads on each, clasping the circumferential beads of the other.

Claim.—First, uniting joints of stove pipe, by means of the projections made by the indentations *a* on one piece being shoved longitudinally in the groove *b* of the opposite piece, and then turned into the circumferential groove *c*, as shown and described.

Second, uniting joints of pipe by means of the circumferential beads *e* and *n*, and the narrow slits *h*, when arranged for joint operation, as herein described.

63,798.—MOSES A. JOHNSON, Lowell, Mass.—*Machine for Felting or Furling Yarn, &c.*—April 16, 1867.—The main cylinder has a cork surface employed because of its pliable, elastic, and enduring qualities, its even surface and non-liability to injury from steam or water. The yarn is carried between said cylinder and fibrous belts, passing around steam-heated cylinders, and motive and idler rollers. Perforated pipes beneath the belts throw jets of hot water on the latter.

Claim.—In combination with a cork surface, aprons, cylinders, and steam rolls, and the presence of heat and moisture for felting or furling yarns, composed of wool, fur, hair, in whole or in part, substantially as described.

63,799.—CYRUS G. JONES, Orono, Me.—*Saw Mill Dog.*—April 16, 1867.—The log is clamped on two or more of the trucks and run forward to the gang saws. As the saws come in proximity to the truck the log is clamped at another point. The clamping jaws are operated by racks and pinions.

Claim.—First, the short carriage A, constructed substantially as shown and described, for use in front or rear of the saw, and having the two independently moving jaws H and I, mounted thereon in such a manner as to dog the log from above and below, substantially as herein set forth.

Second, the jaw I, mounted on the guide rods R, and arranged to be operated by the wheel D and cord U, substantially as described.

63,800.—F. H. JONES, Attica, N. Y.—*Windlass for Wells.*—April 16, 1867.—The loose drum has a friction disk which is backed by springs and engages a similar disk on the crown ratchet sleeve, having longitudinal movement on the winch shaft. This ratchet engages a similar ratchet of the shaft to remove the collar and engage the disks. The shaft has a spur ratchet and drop pawl to prevent back rotation. The disks act as brakes in lowering the bucket.

Claim.—The loose drum C and windlass shaft B, in combination with the disks *j* and E, springs Z, sleeves D, clutch *f*, winch G, and adjusting screw N, arranged and operating substantially in the manner and for the purpose set forth.

63,801.—JAMES LEFEBER, Wayne county, Ind.—*Portable Fence.*—April 16, 1867.—The triangular cross posts are connected by cross pieces in whose slots the rails are fitted. A cross piece surmounts the top of the posts above the running rider.

Claim.—The double triangle, consisting of the posts A A, bars E E, and cross pieces *e e*, and rails 1, 2, 3, 4, 5, 6, and 7, in combination with the cross pieces *c c c c* and D D, all arranged and constructed substantially as and for the purposes set forth and described.

63,802.—R. B. LOCKE, New Orleans, La., and WILLIAM B. ULRICH, Concordia Parish, La.—*Gas Burner.*—April 16, 1867.—A small axial tube supplies the jet in the bulbous cap around the main burners; the jet remains lighted while the main pipe is closed and is closed when the main pipe is lighted. The same spigot acts to make these changes of connection, having side ramifications which conduct to the axial tube in the former case, and a divisional piece which closes the said tube in the latter case.

Claim.—First, providing a gas burner with a small secondary gas taper or burner, which is so arranged as to serve as a means for lighting the gas when admitted to the principal burner, substantially as described.

Second, in combination with a gas burner, which is provided with a smaller gas burner or taper for lighting it, we claim a cock D, which is constructed so that it shall cut off the gas from the smaller burner when gas is admitted to the main burner, substantially as described.

Third, the divisional piece *d*, or its equivalent, applied to the orifice *a*, of the grooved cock D, and constructed with gas escapes *e e*, in combination with a self-lighting burner, substantially as described.

Fourth, the hood of shell G, in combination with a

self-lighting gas burner which is constructed substantially as described.

63,803.—ROBERT O. LOWREY, Saratoga Springs, N. Y.—*Cement Roofing.*—April 16, 1867.—Interstices are left between the boards of the sheeting to form clinches for common mortar that is spread thereon. When the mortar is dry roofing cement is spread over it.

Claim.—A plastic foundation for roofs to receive, hold, and absorb more or less of the roofing cement, constructed and applied substantially as set forth.

63,804.—WILLIAM H. McLELLAN, New Orleans, La., assignor to St. CHARLES STREET RAILROAD COMPANY, same place.—*Fare Box.*—April 16, 1867.—The ticket is dropped into the hopper whose tilting brings up the rest shelf where the fare is visible to the passenger and driver. On release of the push plate the ticket is allowed to slip into the locked receptacle.

Claim.—The combination of the push arm A, tilt door and shelf B, tilt C, and sliding shelf D, when these several parts are constructed and arranged for conjoint operation as described, for the purpose set forth.

63,805.—JOSEPH MILLER, Cuba, N. Y.—*Manufacture of Sheet Iron.*—April 16, 1867.—The sheet is formed slightly thicker than ultimately required, and heated to nearly the welding point by jets above and below the plate immediately before passing between the finishing rollers.

Claim.—The improved mode of manufacturing sheet iron, as herein shown, by raising it to a welding heat just as it is about passing between the finishing rollers, substantially as and for the purpose described.

63,806.—JOSEPH MORGAN, West Springfield, Mass.—*Hay Loader.*—April 16, 1867.—A portable grooved drum is attached to the inside of the wheel of a wagon; has an automatic connection with the wheel, and connects by a cord running over pulleys on a crane with the fork directed by the attendant.

Claim.—The attachment of a wooden grooved drum to the inside of a wheel of a hay cart or wagon revolving upon the hub in combination with the crane and machinery by which said drum is connected to and disconnected from the wheel automatically, the whole constructed and operating substantially in the manner as herein described.

63,807.—CHARLES MORRILL, New York, N. Y.—*Pendulum Level and Sight Combined.*—April 16, 1867.—The pivoted graduated frame carries a swinging bob with index attached to indicate the degree of inclination. A rib on the inner side prevents deviation of the bob. A set screw confines the motion of the frame.

Claim.—First, the combination of a swinging frame C with a suitable stock A, substantially as herein specified.

Second, the combination of the swinging frame C, stock A, and arms B, substantially as herein specified.

Third, the combination of the set screw H with one of the arms B and swinging frame C, substantially as herein specified.

Fourth, the combination of the globe-sight E G with the stock A and swinging frame C, substantially as and for the purpose herein specified.

Fifth, the bob or pendulum D, with the graduated swinging frame C, when such bob is pivoted at its upper end to the upper part of said swinging frame, substantially as shown and described.

Sixth, providing the inner surface of the swinging frame C, with a rib *d*, and constructing the lower end of the bob or pendulum conformably thereto for the purpose of allowing the bob or pendulum none but the required motion.

63,808.—E. L. MORSE, St. Louis, Mo.—*Compress for Cotton, &c.*—April 16, 1867.—The lifting rods connect the lower platen to wrist pins on the solid wheels rotated by the right and left worm gears of the rotating shaft.

Claim.—The combination of the endless screws E' on the power shaft E with the screw guard sectors or

wheels C, the lifting rods C², and platen D, when acting substantially as and for the purpose set forth.

63,809.—A. M. OLDS, New York, N. Y.—*Vegetable Slicer*.—April 16, 1867.—The knife blade in connection with an adjustable inclined plane regulates the thickness of the slice.

Claim.—The combination of the adjustable inclined plane B, with the grater A, slots D, and triangular apertures F, when constructed and arranged substantially in the manner and for the purposes set forth.

63,810.—DEWEY PHILLIPS, Shaftsbury, Vt., and WILLIAM REID, West Arlington, Vt.—*Securing Heads in Seamless Casks*.—April 16, 1867.—Explained by the claim.

Claim.—The method herein described of putting the heads or bottoms in seamless casks or other vessels by making the heads or bottoms of a less diameter than the inner diameter of the shells at the croze, and then compressing the ends of the shell into close contact therewith preparatory to putting on the hoops, substantially as described.

63,811.—DAVID R. PRINDLE, East Bethany, N. Y.—*Portable Furnace for Boilers*.—April 16, 1867.—An improvement on his patent No. 25,442. The fire-place is surrounded by air spaces which are covered by a horizontal plate projecting to form a deflector, to drive the caloric current forward and under the boiler.

Claim.—First, the construction of a combined furnace and support for boilers, caldrons, or steaming vessels of an extended horizontal base D on outer jacket E, and a constructed fire box which is formed of side plates F F' and F'', substantially in the manner described.

Second, in a furnace which is adapted for supporting and heating caldrons or steaming vessels, the air spaces *g g g* for protecting the fire box plates, formed substantially as described.

Third, the deflector plate G, adapted to serve as a cover for the rear air space *g*, and also as a means for directing the heated products of combustion forward around the bottom of the caldron, substantially as described.

Fourth, a heating furnace, which is also adapted to serve as a firm and safe support for a caldron or steamer, constructed substantially as herein described.

63,812.—ELIAS RHODES, Jr., Clyde, Ohio.—*Horse Hay Fork*.—April 16, 1867.—The lower ends of the links are pivoted to the jaws, and the upper ends of the outer links to the cross head to which the attachment rings are pivoted. The jaws are kept in position by a lug operated by a lever pivoted in the cross head.

Claim.—First, the tubular rods or links A B C, provided with the shanks *l* and head F, constructed and applied as and for the purpose set forth.

Second, the arrangement of the lever arm G provided with the lug *h* in combination with the cross-head E, tubular links A B C, shanks *b*, and jaws D, when the several parts are constructed and arranged as and for the purpose set forth.

63,813.—WM. B. RICE, Utica, N. Y., assignor to himself, JOHN RICE and E. S. MUNSON.—*Metallic Bobbin*.—April 16, 1867.—The upper end of the bobbin is strengthened by an inserted annular piece. The enlargement at the base is of a stepped conical form, an axial section showing acute re-entering angles. It is made of sheet zinc.

Claim.—First, the combination of a hollow metal base C with a tubular metal spindle A, constructed and united substantially as and for the purpose set forth.

Second, the inverted conical shoulders formed at the base of the hollow spindle when the said spindle is attached to the hollow metallic head, substantially as and for the purpose set forth.

63,814.—ALBERT D. RICHARDS, Lowell, Mass.—*Apparatus for Making Medical Plasters*.—April 16, 1867.—Attached to the upper surface of the block is a bed piece, concave upon its upper side. The shield pan hinged to the block has an opening in its bottom. The material is spread on the leather, which is exposed by the opening in the shield. The form of the block renders the deposit thin on the edge of the plaster. A catch holds the shield when down.

Claim.—First, the bed piece B when made with sunk panel and raised edge, substantially as shown and described, and for the purpose set forth.

Second, the pan C when made with the opening having chamfered edges, in combination with the bed piece B.

63,815.—GEORGE O. SANDERSON, Boston, Mass.—*Gas Cooking Stove*.—April 16, 1867.—The stove has gas pipes with burners beneath the oven and in the cylindrical lining of the pot holes. The pipes have side openings for admission of air to mix with the gas.

Claim.—First, the combination and arrangement of the pipes G G with the oven L, substantially as described and for the purpose set forth.

Second, the combination of the basins B B' with the pot holes of the cooking stoves, substantially as described and for the purpose set forth.

Third, the combination of the short cylinders D D with the rear pot holes and the top of the oven, substantially as described and for the purpose set forth.

63,816.—JOHN SCHAEFFER, St. Louis, Mo., assignor to SAMUEL BAXTER, same place.—*Steam Safety Valve*.—April 16, 1867.—The valve has an under and an upper seat; the latter to close the opening to the locked up chamber containing the levers. The valve stem and weighted lever are loosely connected together to avoid any jamming.

Claim.—The arrangement of the double-seated safety valve C with reference to the case D and levers E and F, substantially as and for the purpose set forth.

63,817.—FRANCIS B. SCOTT, Lancaster, N. Y.—*Lady's Fan*.—April 16, 1867.—The embossed card fan is strengthened by extensions from the wooden handle, and the middle is perforated to avoid obstructing the view.

Claim.—A lady's fan having a perforated center piece A with or without designs printed or formed thereon, as a new article of manufacture, substantially as described.

63,818.—FRANCIS B. SCOTT, Lancaster, N. Y.—*Window Screen*.—April 16, 1867.—The perforated figured card is enclosed in a frame for a cheap screen.

Claim.—A window screen made of perforated card board and supported in a wood or iron frame, as a new article of manufacture, substantially as described.

63,819.—LOUIS W. SPENCER, New York, N. Y., assignor to SCHREIBER CORNET MANUFACTURING COMPANY, same place.—*Machine for Cutting the Wind Passages in the Rotary Valves of Cornets*.—April 16, 1867.—The cylindrical blank having a journal pin at each end, is clamped by the jaws to the clutch and presented to the rotary cutter by movement of the screw rest on which the clutch is supported.

Claim.—The combination of the mandrel with its burr cutter, the chuck capable of being turned and held in position and provided with gripping jaws, substantially as described, and the two carriages capable of being moved at right angles, the one with the other, substantially as and for the purpose described.

63,820.—A. N. TOWNE, Chicago, Ill.—*Handle for Signal Lanterns*.—April 16, 1867.—The bent handle is hung upon the guard handle and attached to the building or car.

Claim.—Bending a lamp handle at or near the center at a right angle, in combination with a guard handle, or its equivalent, as and for the purpose set forth.

63,821.—A. D. WESTBROOK, Buffalo, N. Y., assignor to himself, R. W. DANIELS and JOHN HUMPHREY, same place.—*Protecting Pad for Interfering Horses*.—April 16, 1867.—The pad strap catches in the crevice between the heel and the shoe, and is fastened by a hook engaging with the clip in front.

Claim.—Retaining the pad in place on a horse's hoof by means of a hook J which engages with the clip *e* of the shoe, substantially as set forth.

63,822.—PETER MEYERS, Stouffville, Ohio, administrator of the estate of EMANUEL YOUNG, de-

ceased.—*Wood Reamer*.—April 16, 1867.—The reamer head has acute angular ribs, and is preceded by a guide which maintains its central position.

Claim.—As a new article of manufacture a tapering reamer constructed substantially as set forth.

63,823.—JOHN ALLEN, Palmer, Mass., assignor to himself and SAMUEL TERRY, same place.—*Die for Swaging Calks for Horseshoes*.—April 16, 1867.—The swage sockets are formed in the edges of removable plates, one-half in each plate, and the bottoms of the sockets are open to allow scales to drop through into the channels in the bed below.

Claim.—A toe-calk die constructed of the plates *a b c* with the grooves *d e f g*, arranged and constructed substantially as and for the purpose set forth.

63,824.—GEORGE B. ATWOOD, Philadelphia, Pa.—*Permutation Lock*.—April 16, 1867.—One-half of the thickness of the disks is cut away at the periphery to a small depth, and the remainder slotted radially. A fixed plate the thickness of the slots has projections enclosing the annular grooves of the disks. The inner disk is attached to the spindle, and has a pin entering a segmental groove in the next, by which the latter is moved, and so on consecutively. When the disks are rotated into proper position, which is done by alternate and specific turning of the knob in contrary directions, the spindle can be drawn forward to engage and turn the cam which throws the bolt. The measuring ring is made loose to mislead the dishonest.

Claim.—First, locking the spindle *D* in a position disconnected from the bolt *F* by preventing longitudinal motion without preventing rotary motion in the said spindle by means of the disks *E E' E''* and block *K*, constructed and arranged to operate together substantially in the manner described and set forth.

Second, I claim the loose measuring ring *I* in combination with the knob *C*, arranged and operating together substantially as and for the purpose described.

63,825.—JOHN AUGSPURGER, Trenton, Ohio.—*Portable Fence*.—April 16, 1867.—Each panel has one long and one short post. The former rests upon the ground and has hooks to receive the shorter part of the adjoining panel, and a spring plate above one of the socket rings to prevent the disconnection of the hinges.

Claim.—The construction of a light and portable fence in lengths of panels with one short and one long post, substantially as shown and described, to be connected in a worm or zigzag shape by means of the hooks *C C'* and eyes or staples *D D'*, in combination with the spring *E*, as set forth.

63,826.—JOHN AUGSPURGER, Trenton, Ohio.—*Portable Fence*.—April 16, 1867.—The panels being attached, as stated, the slide passing between the vertical posts and braces prevents their attachment.

Claim.—The construction of a light portable fence in lengths or panels, with one short and one long post, substantially as shown and described, to be connected and secured in a worm or zigzag form by means of the prolonged and gained rails *F F'*, in combination with the slide *D*, as shown and set forth.

63,827.—JOHN AUGSPURGER, Trenton, Ohio.—*Portable Fence*.—April 16, 1867.—The projecting ends of certain of the rails are gained together, and their detachment prevented by the interlocking of the intervening rail ends, which are halved out in contrary way to the gains of the other rails.

Claim.—First, the construction of a light portable fence in lengths or panels, with one short and one long post, substantially as shown and described, to be connected and secured in a worm or zigzag shape by means of the prolonged and gained ends of certain of the rails, and the notched and tongued intermediate rails, as *a b*.

Second, in combination with the elements of the first clause, the additional block *D* attached to the end of the supporting foot of each panel, to serve as an anchor to give the fence additional firmness.

63,828.—JOHN AUGSPURGER, Trenton, Ohio.—*Portable Fence*.—April 16, 1867.—The panels are hinged together, and their detachment prevented by

the engagement of the two blocks, or a block and gain, when the panels are turned in a zigzag form.

Claim.—First, the construction of a light and portable fence in lengths or panels, with one short and one long post, substantially as shown and described, to rest upon the surface of the ground in a worm or zigzag shape, and to be connected and secured by means of the hooks *C*, staples or eyes *D*, and cleats *a b*, or cleat *E* and oblique gains *F*, operating as shown and set forth.

Second, in combination with the elements of the preceding clause, the block *H*, serving as an anchor, as set forth.

63,829.—JOHN AUGSPURGER, Trenton, Ohio.—*Portable Fence*.—April 16, 1867.—The detachment of the panels is prevented by drop buttons.

Claim.—The construction of a light portable fence in lengths or panels having one short and one long post, substantially as shown and described, and connected and secured in a worm or zigzag form by the hooks *a* and staples *b*, in combination with the gravitating button *D*, and anchor block *C*, the whole operating as shown and set forth.

63,830.—WILLIAM M. BALL, Morristown, Ind.—*Cultivator*.—April 16, 1867.—The middle shovel standard is attached to a central beam; the others are curved right and left, and stayed by rods. The handles rest upon a vertical post on the rear portion of the beam.

Claim.—First, the arm *s*, provided with screw thread and nuts *t*, as described, in combination with bar *e*, for the purpose herein specified.

Second, the arm *s*, provided with screw thread and nuts *t*, the bar *e*, handle *d*, standards *C C C*, braces *b b b* and beam *A*, when the whole are combined, arranged and operating in the manner and for the purpose substantially as herein set forth.

63,831.—LOUIS BAUHOEFER, Philadelphia, Pa.—*Mattress and Life Preserving Float*.—April 16, 1867.—Two mattresses filled with cork have between them an air bag, confined in a fibrous sack to prevent rupture, the whole forming an elastic bed, which may be separated into several distinct life preservers in accidents on water.

Claim.—First, an air bag *C* and a mattress or cushion *D*, arranged within a frame substantially as and for the purpose described.

Second, the frame *A*, with its buoyant cushion *B* and detachable buoyant cushion *D* and detachable air bag *C*, the whole being arranged substantially as and for the purpose set forth.

Third, the frame *A*, with its detachable cushion *D*, in combination with the detachable cover *e* and the strips *e e*, or their equivalents, for the purpose specified.

63,832.—J. C. BEACH, Bloomfield, and J. ABBEY, Orange, N. J., assignors to J. C. BEACH, Bloomfield, N. J.—*Machine for Disintegrating and Pulping Fibrous Material*.—April 16, 1867.—The spirally ribbed cylinders are geared together, the edges of the ribs acting as shears to cut the material. The case has ribs in opposite directions to those on the rollers, and acting with them to disintegrate the pulp. A longitudinal bar is placed below and nearly touching the engaging portions of the rollers. The hopper is near one end and the exit pipe centrally situated at the other. The cutting ribs on the rollers are multiplied toward the exit.

Claim.—First, the combination of the two spiral ribbed cylinders *A A*, constructed and operating together in the manner and for the purpose set forth.

Second, the flat-faced bar *p* and the adjustable boxes *t*, either or both of them, when used in combination with the spiral ribbed or grooved cylinders constructed and operated as shown.

63,833.—W. W. BEAN, Iowawea, Iowa.—*Wagon Brake*.—April 16, 1867.—The draft bolt slips back in slots in the hounds when descending a hill; the tongue connects by a key block with the adjustable reach, whose attached rubber is held against the wheel.

Claim.—The application of the key block *C*, Fig. 3, in combination with brake operating upon the wheels by the action of tongue bar sliding in the holes *F* made

in the tongue hounds, with the frame E and brace bars D D connected with the wooden rubber, as substantially described.

63,834.—WM. S. BEEBE, Philadelphia, Pa.—*Concession Fuse for Explosive Shells.*—April 16, 1867.—Explained by the claims.

Claim.—First, so attaching an inertia fuse to the interior of a hollow projectile that while it is secure against any ordinary shock, it will be broken loose by the discharge of the cannon or mortar from which it is fired, when such fuse is so constructed and arranged that, lying loosely in the powder during the flight of the projectile, it will turn its loaded end against the wall of the cavity in the projectile and explode when the flight of such projectile is suddenly arrested or checked, substantially as above described.

Second, a percussion or frictional fuse which is constructed with a loaded head A, terminating in a feathered tail a, and adapted for use in spherical and other tumbling shells, substantially as described.

63,835.—E. B. BEECHER, Westville, Conn., and JOSEPH G. DAVIS, HENRY S. FROST, and ANTHONY G. DAVIS, Watertown, Conn.—*Blind Fastening.*—April 16, 1867.—The grooved friction wheel on the shaft of the bevel wheels commanding the lower hinge of the shutter has two semicircular clamps, by pressure on which the grooved wheel is clamped to fasten the hinge.

Claim.—First, the combination of the grooved friction wheel or pulley H, the two semicircular clamps or brakes I, and the slotted cap or case G with each other, with the shank of the knob or handle F, and with the shaft E of the gear wheel D, substantially as herein shown and described.

Second, the shaft E, connected to the gear wheel D and to the knob or handle F, in the manner herein shown and described, and for the purpose set forth.

63,836.—H. C. BERRY, Wauseon, Ohio.—*Wood-turning Lathe.*—April 16, 1867.—The back rest has a slotted segmental frame with two pivoted adjustable bars attached, having friction rollers upon their ends to afford revolving bearings for the wood which is being turned.

Claim.—A back rest for a wood-turning lathe composed of the segment A, in combination with the spreading bars B B and the friction rollers d d, constructed and operating substantially as and for the purpose herein specified.

63,837.—SALMON BIDWELL, Bordentown, N. J.—*Button for Fastening Carriage Curtains.*—April 16, 1867.—The slotted plate of the curtain slips upon the pin, and a gravitating latch holds it in position.

Claim.—The construction and arrangement of the vertically swinging triangular plate b, pivoted in the pin A, in such a manner that its inner point may fall by its own gravity and rest against the upper edge of the shoulder upon the pin G, its lower point fitting over and securing the plate D, as herein shown and described for the purpose specified.

63,838.—WILLIAM ZELLER, Lebanon county, and RICHARD LECHNER, Berks county, Pa., assignors to JAMES WALLACE, Lebanon county, Pa.—*Plow.*—April 16, 1867.—The lever operates the rod longitudinally to thrust obstructions from the breast of the plow.

Claim.—The jointed rod D D', used in combination with the beam and the handle H, as and for the purpose specified.

63,839.—JAMES E. BLAIR, New Haven, Conn.—*School Desk.*—April 16, 1867.—The cover is attached by links to the stand and retains its attachment, but is removable to expose either surface.

Claim.—A school desk cover, reversible in the manner substantially as described, having one of its surfaces coated or plated, as herein set forth.

63,840.—REINARD BLUM, Champaign, Ill.—*Hand Cultivator.*—April 16, 1867.—The plow shank is adjusted by wedges which secure it in the beam. The supporting wheel runs in the slotted beam. A strap connects the ends of the handles.

Claim.—The arrangement of the beam A, wheel

B, shank C, provided with point or tooth D, with the handles E E and strap F, for forming a hand cultivator, substantially as specified.

63,841.—DOUGLAS BLY, Macon, Ga.—*Attachment to Mucilage Bottles.*—April 16, 1867.—The cover is attached to the brush handle, and the brush passes down between the flexible, intumed jaws of the cylinder, which is vertically adjustable.

Claim.—First, an attachment to a mucilage bottle for clearing the brush, having such a range of motion that when lowered it rests beneath the surface of the liquid, but when raised for action it rests above the surface, as set forth.

Second, an attachment to a mucilage bottle, so arranged that the clearing edge for the brush is situated below the mouth of the bottle, as specified.

Third, a device for clearing the brush of a mucilage bottle, consisting of flexible jaws, between which the brush rests, as herein set forth.

Fourth, the combination of the nibs e and stops d with the attachment B and bottle A, operating substantially in the manner and for the purpose specified.

Fifth, the cover g, provided with the slits h, for shutting over the flange of the attachment, as herein set forth.

63,842.—CHARLES BOERNICKE, Philadelphia, Pa.—*Wood Boring Bit.*—April 16, 1867.—The tool is for boring a hole larger at bottom than at top, and it contains a movable cutting lip which is thrust outward by its pivoted rod, which is pressed inward by the side of the hole as the tool advances, or by a washer surrounding the said hole.

Claim.—The combination and arrangement of the tube A, composed of the slotted parts e f, within which is pivoted the rod b, provided at its lower end with the horizontal cutter c, working through the slot near the lower end of the tube A, its upper end bent so as to project in an inclined line through the slot in the upper part of the tube A, and held outwardly by means of the spring d, as herein set forth, for the purpose specified.

63,843.—A. BORROWMAN, New York, N. Y.—*Car Bell.*—April 16, 1867.—Explained by the claim and illustration.

Claim.—Suspending the tongue B in the slotted bell A by means of the pin C, passing through the upper side of the bell and through the end D of the tongue B, as herein set forth, for the purpose described.

63,844.—HENRY D. BOSS, Williamsburgh, N. Y.—*Boot Jack.*—April 16, 1867.—Explained by the claim.

Claim.—A boot jack having the inside of its jaws provided with an india-rubber bearing surface for the boot heel, inserted therein, substantially as and for the purpose specified.

63,845.—F. PHILIP BOURNE, Williamsbridge, N. Y.—*Propelling Attachment for Children's Slids.*—April 16, 1867.—Two slotted levers hung on pins in the middle knee, have picks projecting from their segmental ends by which to propel the sligh.

Claim.—The attachment of lever picks B to sleds, &c., substantially as and for the purpose described.

63,846.—BENJAMIN F. BRADY, New York, N. Y.—*Exercising Apparatus.*—April 16, 1867; antedated April 8, 1867.—The levers have rectangular projections with series of holes for adjustable attachment of the tension springs.

Claim.—First, the combination of the levers F with the seat a, and with springs applied in such manner that their tension will oppose the backward movement of the said levers, substantially as herein set forth, for the purpose specified.

Second, the outriggers B, levers F, arms D, and springs E, combined in relation with each other and with the box A and seat a, substantially as herein set forth, for the purpose specified.

63,847.—ELLISON BROWN, Indianapolis, Ind., assignor to himself and JAMES B. BELL, Cincinnati, Ohio.—*Composition for Coating Leather.*—April 16, 1867.—Composed of asphaltum, 10 lbs.; fish oil, 1 gall.;

spirits of turpentine, 1 gall.; rosin, 2½ lbs.; beeswax, 1 lb.; lampblack, ¼ lb.

Claim.—The water-proof oil polish compounded of the ingredients named, or their chemical equivalents, in the manner and for the purpose substantially as set forth.

63,848.—PETER BRUSO, Erie, Pa., assignor to himself and CHARLES B. CLARK, Buffalo, N. Y.—*Electro-Magnetic Battery.*—April 16, 1867.—The adjustable arm connects the opposite poles and has a binding screw for holding the platinum, and an adjustable yoke for holding the zinc.

Claim.—The adjustable connecting arm A, for the cups of the electro-magnetic batteries, consisting of the pivoted attachment *f f q* and sliding clamp for the platinum, constructed and operating substantially as set forth.

63,849.—W. F. BUCKELEW, Shreveport, La.—*Cotton Tie.*—April 16, 1867.—The ends of the wire are engaged, and the bent and sharpened ends thrust into the bale.

Claim.—The point *A b a*, in combination with the point *c* and the bend *b C*, as and for the purpose set forth.

63,850.—IRA S. BULLARD, Geneva, N. Y., assignor to himself and C. H. PARKER, same place.—*Attachment for Controlling Draft in Stove Pipes.*—April 16, 1867.—The perforations of the movable plate register with the openings in the plate beneath, and the position of the former is indicated and maintained by a finger. A graduated scale and a circular series of depressions engaged by a spring pin.

Claim.—The construction and arrangement upon the side of the stovepipe A of the circular box B provided upon slotted face C with a semicircular graduated ring D and depressions *b*, into which fits the pointed stud of the spring index hand H secured to the end of the damper spindle G, sliding slotted plate I, hung upon said spindle and held in place by means of the spiral spring *b'*, substantially as herein shown and described for the purpose specified.

63,851.—JOHN BURNS, Elyria, Ohio.—*Corn Planter.*—April 16, 1867.—The sections of the frame are laterally extensible. Blades project from the periphery of the front wheels and are followed by seed conductors connected by sliding valves with the seed box. The blade wheels are lifted above the ground by action of a lever which connects the frame and tongue rigidly together, throwing the forward weight on the neck yoke.

Claim.—First, the wheels D, provided with the rotary cutting blades E, in combination with conductors O and seed boxes Q, when arranged and operated conjointly with the adjustable frames A B, as and for the purpose described.

Second, the levers J L and links M K, as arranged, in combination with the pole H and adjustable frames A B, for the purpose and in the manner set forth.

63,852.—W. W. BURSON, Rockford, Ill.—*Straw Cutter.*—April 16, 1867.—The feed rollers have serrated corrugations. The trough is inclined in relation to the knives which are upon the revolving pulley, whose arms incline outward to allow the feed behind the knives. The stationary cutter has serrations to prevent the slipping of the twigs upon it.

Claim.—First, the arrangement of the cutting knives *a a'*, in combination with the spiral arms *h h'* of pulley A, constructed and operating substantially as described.

Second, in a combined fuel and feed cutter, the manner of fastening the cutting knives *a a' b b'* to the pulley A, substantially as described.

Third, the arrangement of the knives *a a' b b'* to the pulley A, and the construction of the stationary cutter *c*, operating substantially as and for the purpose set forth.

Fourth, the arrangement of the feed passage I with relation to the cutters *a c*, substantially as described and operating for the purpose set forth.

Fifth, the construction of the feed rollers *d d'*, for the purpose of giving an intermittent feed motion, as described.

Sixth, the placing of the additional knives *b b'* upon

the pulley A, and additional serrated plates *i i* upon the feed rollers *d d'*, substantially as described and operating for the purpose set forth.

Seventh, the combination and arrangement of the nut F with shaft H and cutter pulley A, substantially as described and operating for the purpose set forth.

63,853.—JOHN T. CAMPBELL, Rockville, Ind.—*Portable Fence.*—April 16, 1867.—The panels consist of posts and rails of inch stuff held together by the same screw bolts which connect panel to panel, and are braced by stake rods which are run between the rails and have series of notches to allow of use on uneven surfaces.

Claim.—First, the cross stakes C with the notches *b*, combined with the wedge *c* and arranged for supporting the plank rails A, in the manner herein specified.

Second, a fence constructed with the plank rails A and posts B, so united by bolts and nuts *a* as to permit any required degree of inclination to be given to the rails, the posts remaining vertical, thus permitting its adaptation to convertible use, substantially as and for the purpose set forth.

63,854.—M. D. CONE, Port Gibson, N. Y., and A. N. DOUGLASS, Avon, N. Y.—*Hand Seeding Machine.*—April 16, 1867.—The machine is mounted on a wheelbarrow and is operated by an adjustable traverse wheel in the rear, which connects by an endless band with the seed cylinder. The revolving perforated seed cylinder regulates its delivery by an adjustable band with various sized holes.

Claim.—First, suspending the seeding apparatus from the front of a hand barrow by which they are drawn, substantially in the manner and for the purposes shown and described.

Second, the employment or use of the revolving seed cylinder C when it is made to contain the supply of grain, substantially as and for the purposes set forth.

Third, enclosing the grain cylinder C within the casing B, for the purpose of concentrating the seed after leaving the distributing cylinder and conveying it to the drill through the conductor.

Fourth, the adjustable perforated band *n*, in combination with the revolving seed cylinder C, substantially as and for the purposes set forth.

63,855.—JAMES L. CANHAM, Newark, N. J.—*Locking Apparatus for Ferry Boats.*—April 16, 1867.—The fenders have ratchet racks and the boat has spring pawls to engage therewith; the latter are drawn back by chains lapping around a shaft operated by a hand wheel.

Claim.—First, pivoting the blocks D to the frame of the boat, in such a position as to take hold of the teeth of the racks C and hold the boat locked, substantially as herein shown and described.

Second, the combination of the springs F, pivoted blocks D, chains G, shaft H, ratchet wheel J, and pawl K, with each other, substantially as herein shown and described and for the purpose set forth.

Third, attaching racks C to the fenders B, substantially as herein shown and described and for the purpose set forth.

63,856.—FREDERIC CARL, Charlestown, Mass.—*Machine for Stuffing and Currying Leather.*—April 16, 1867.—The cylinder has a coiled helical steam pipe attached to its inner side used to heat it when at rest, and has an axial steam drum with a foraminous jacket to protect the hides from its contact. The hides and adipose matters are placed within and the cylinder rotated.

Claim.—First, the combination of the rotating cylinder A of the shaft B D and perforated cage E, or its equivalent, as and for the purpose described.

Second, the combination of the cylinder A and coiled pipe G, as and for the purpose set forth.

63,857.—OLIVER S. CHAPMAN, Canton, Mass.—*Excavator.*—April 16, 1867.—The shovel bottom is hinged to a bent pivoted bar, and is partially cut away to avoid contact with the operating bar, and a supplementary door stops the aperture caused by this deficiency. The shovel mechanism is operated by the tightening of friction bands adjustable at one end and

at the other connected to the short arms of a rock shaft, whose longer arms are operated by grooves in a conical block, which has sliding movement on its shaft by a hub on the same. The flanges of two of the supporting wheels are notched to give bearing to levers by which they are turned. The compound gear wheel, whose shaft carries the gear wheel for the chains by which the crane is swung around, has a central disk attached to the shaft having lugs which enter segmental slots of the larger disk in which it is recessed; on each side of these lugs within the slots is placed a block of rubber to ease the machinery in starting.

Claim.—First, the shovels E, provided with the doors F' and f, arranged to operate as herein described.

Second, the combination of the laterally adjustable hmb h, provided with the inclines e' and the rock shaft c, for tightening the friction bands b, substantially as and for the purpose set forth.

Third, the combination of the bands U, rock shafts c, provided with the arms or levers d', and the block W, when arranged to operate as and for the purpose set forth.

Fourth, constructing the wheels with a notched flange, as represented in fig 1, for the purpose herein set forth.

Fifth, constructing the machine with the extra wheels T, of larger diameter than the wheels G, for the purpose of running the same on ordinary railway tracks clear of obstructions, substantially as set forth.

Sixth, the compound gear wheel, consisting of the movable portion F, having slots therein, and the disk F, with projections to fit into said slots, with the rubber or other yielding material interposed, the whole being arranged for joint operation, substantially as shown and described.

Seventh, the combination of the clutch wheel I, constructed and arranged as described with the endless chain H* and sprocket w and w', as set forth.

63,858.—ISAAC H. CHAPPELL, Decatur, Ill., assignor to himself and JAMES B. MILLISON.—*Planter and Cultivator Combined.*—April 16, 1867.—The plow standards are attached to the frames in front by chains and are pivoted to the beams above which are adjusted by levers secured to segmental bars; the plows are moved laterally by levers in reach of the driver. The seat is adjustable to bring the driver's weight over the rollers or cutters. Adjustable slides regulate the amount of seed furnished by paddles in the seed box, worked by a belt communicating with the supporting wheel.

Claim.—First, the combination of the adjustable lever J with the beams H, substantially as herein shown and described, and for the purpose set forth.

Second, the combination of the bent lever W, and cross bar X, with each other, and with the standards T, of the plow S, substantially as herein shown and described, and for the purpose set forth.

Third, making the seat bar N' adjustable, substantially as herein shown and described and for the purpose set forth.

Fourth, the combination of the roller shaft G', arms H' I, shaft J' and arm K', with each other, and with the valve bar F', substantially as herein shown and described and for the purpose set forth.

63,859.—E. E. CHESNEY, Abingdon, Ill.—*Seed Planter.*—April 16, 1867.—The gauge wheels carry spokes to mark out the ground and are weighted to insure regularity in starting; they are attached to a single axle whose seed pockets pass through the hoppers of the dropping device. The broad faced supporting wheels are also run with a single shaft and act as coverers. Farrowing plows precede the seeder, and the seed is covered by the rear adjustable plows in soil non-reducible by the rollers. The tongue is attached to the rear cross bar of the frame, and is held and adjusted between vertical bars attached to the front cross bar.

Claim.—First, the combination of the gage wheels D, and single shaft C, with the seed boxes B, and frame A, of the machine, substantially as herein shown and described.

Second, operating the shaft C, to drop the seed by means of a hand lever K, substantially as herein shown and described.

Third, the combination of the tongue I, and upright bars J, with each other and with the frame of the machine, substantially as herein shown and described and for the purpose set forth.

Fourth, the combination of the plows H and G, with the frame of the machine, substantially as herein shown and described.

63,860.—ENOCH CONGER, Lexington, Ohio.—*Shingle Machine.*—April 16, 1867.—One of the sashes has a lateral movement given to it by an inclined bar on the carriage, during the longitudinal movement of the latter, to cause an oblique cut in the block by one saw, to form the thick and thin ends of the shingle.

Claim.—First, in a shingle machine, the two saw sashes E and F, placed one behind the other, and to one of which a lateral movement is given for the purpose of giving a taper to the shingles sawed, substantially as herein shown and described.

Second, the combination of the sliding frame H, with the saw sash F, carriage J, to whose under side is secured the inclined bar L, working in the inclined groove of the cross bar h, of the sliding frame H, for the purpose of giving a lateral movement to the said sash, substantially as herein shown and described.

63,861.—SAMUEL B. COOPER, Beloit, Wis., assignor to himself and RICHARD TATTERSHALL, same place.—*Farm Gate.*—April 16, 1867.—The gate slides in a pulley on the pivoted, slotted post and a second pulley near the middle of the gate when shut, which is suspended from the brace attached to the top of the post so that the gate can be partially opened without revolving.

Claim.—First, the revolving slotted post B, for the purpose set forth.

Second, the brace E e, and pulley H, for the purpose specified.

Third, an improved farm gate in combination with the revolving slotted post B, brace E and e, pulleys H and a, gudgeons b, cap C, and fence post D, as herein set forth for the purpose specified.

63,862.—WILLIAM M. CRAWFORD, Ashland, Ohio.—*Farm Gate.*—April 16, 1867.—The gate is raised in the slides by a lever wheel attached to the post. The gate when shut rests in a slotted block under the middle of the bottom rail. A spring catch at the front end fastens the gate when shut.

Claim.—The lever wheel J, tongue board P, slide B, in combination with board C and block K, substantially as shown and described for the purpose set forth.

63,863.—C. O. CROSBY, New Haven, Conn.—*Corset Clasp.*—April 16, 1867.—The loops are made to slip on the steel plates; one carries a hook and the other an eye.

Claim.—The loop B, formed in the manner described, its two ends secured to the tongue d, substantially as set forth.

63,864.—JOHN CURRY, Stanford, Ky.—*Saddle.*—April 16, 1867.—An improvement on the "Murdock" spring saddle. Explained by the claim.

Claim.—The saddle constructed with head piece and cantel, mounted upon and secured respectively to bent plates C E, united by metallic side plates, and forming a skeleton frame for the support of the suspended seat.

63,865.—THEODORE D. DAY, New York, N. Y.—*Clasp for Skeleton Skirts.*—April 16, 1867.—The clasp is made of sheet metal, lined with paper cloth applied before the clasp is cut to guard the skirt from contact with the sharp edges of the metal.

Claim.—The clasp for skirts and similar articles formed with a lining to the clasps and the teeth, in the manner specified.

63,866.—THEODORE D. DAY, New York, N. Y.—*Clasp for Skeleton Skirts.*—April 16, 1867.—Improvement on his patent, September 5, 1865. The clasp forms a hinge having an upward and downward but no side vibration, and consists of two annular flanges, one of which laps around the edge of the other and has projections preventing side movement of the same.

Claim.—The lip or lips *i*, in combination with the clasp hinge *a b*, formed of sheet metal, in the manner and for the purpose set forth.

63,867.—ADOLPH DELKESAMP, Brooklyn, N. Y., assignor to THEODORE D. DAY, New York, N. Y.—*Clasp for Hoop Skirts.*—April 16, 1867.—The teeth are forced through the suspensory tape on each side of the spring and are elined inside.

Claim.—The button or clasp for skeleton skirts formed with the flange 2, the raised head 1, and the teeth 3, as and for the purposes specified.

63,868.—WILLIAM M. DEXTER, Augusta, Ill., administrator of the estate of JOHN A. DEXTER, deceased, assignor to WILLIAM A. NEWTON.—*Stalk Cutter.*—April 16, 1867.—The rectangular lower frame is attached to the tongue of the main frame by a band; they are unitedly supported by a truck, to which the splinter bar, draft pole, and double trees are attached. The cutters rotate near the rear of their adjustable rectangular frame, which is pierced in front by a shaft, on which gravitating hooks are loosely fitted.

Claim.—The truck H, applied to the tongues or poles C D of the frames A E, in combination with the splinter bar L and double trees M M, arranged substantially as and for the purpose set forth.

63,869.—CONSTANT J. DUMERY, Paris, France, assignor to FRANCIS C. CORNHUR, New York, N. Y.—*Apparatus for Tanning.*—April 16, 1867; antedated April 10, 1867.—The upper and under parts of the steam boiler are connected to a separate vessel, whose upper part, through which the pipes connect, has depending convoluted plates to insure circulation of the liquid in its passage from one pipe to another. The vessel has an axial winch shaft with agitating vanes against its conical bottom, and a discharge cock by which solid matter deposited from the liquid is stirred and drawn out.

Claim.—First, the receptacle C, applied outside of the boiler or heating vessel A, and communicating therewith by means of the pipe D E, substantially as herein set forth, for the purpose specified.

Second, the agitating blades or arms *i*, arranged within the receptacle C, and in relation with the opening *d* and tube *e*, substantially as herein set forth, for the purpose specified.

Third, the serpentine partitions F, arranged in the upper part of the receptacle C, substantially as herein set forth, for the purpose specified.

63,870.—J. B. DUNLOP, Meriden, Conn.—*Glass Cleaner.*—April 16, 1867.—The diagonally-fluted metallic plate has a handle attached and is used for cleaning glass.

Claim.—As an improved article of manufacture, a cleaner made substantially as described.

63,871.—BENJAMIN W. DUNNING, Brooklyn, N. Y.—*Cooking Kettle.*—April 16, 1867.—The boiler, meat pan, vegetable pan, and coffee pot are attachable to the furnace and heated conjointly or separately, sectional covers being adjustable to either contingency. They have adjustable strainers, closed except when brought into position with the spout.

Claim.—First, the adjustable covers *g* for closing the vessels to which they are secured, and being provided with strainers, substantially as herein shown and described.

Second, the combination with the rings *e* and *d* and plate *e* of the vessels A B C and D, or any or more of them, substantially as and for the purpose herein shown and described.

63,872.—W. W. DUTCHER and G. DRAPER, Milford, Mass.—*Loom Temple.*—April 16, 1867.—Improvement on the patent of J. Mathis, April 24, 1866. The cheek pieces are formed of single plates, and the separating disks or side bearings of the wheels are firmly attached. The wheels have frustal sockets to receive an axle pin common to all.

Claim.—Each toothed wheel as constructed with the frusto-conical eye, substantially as described.

Also, the toothed wheels so made, and their arrangement directly on, and so as to bear on one common pin and in a carrier, substantially as specified.

Also, our improved carrier, as made with the cheek pieces extended from and combined with a single supporting plate, as specified.

Also, the arrangement of a series of toothed wheels between cheek pieces, or their equivalents, and on and so as to bear on one common pin or axis, and with each wheel inclined thereto, and provided with an eye, which, while resting on the pin, will allow the wheel to be freely revolved thereon and between the cheek pieces.

63,873.—ALBURTIS EAGLE, Trenton, N. J.—*Machine for Mixing Roofing Composition and other Material.*—April 16, 1867.—The powdered slate is gradually fed through the slotted bottom of the cylinder containing tar, by a slotted sliding bar, which alternately closes and opens the holes.

Claim.—A machine for making compositions, consisting of a combination of a hopper D, which is provided with a slotted or reciprocating false bottom *m* and valves *h* of a cylinder B, which is provided with stirrers *s* on the shaft E and stationary arms *u*, and of a furnace A, all made and operating substantially as and for the purposes herein shown and described.

63,874.—JAMES EASTERLY, Albany, N. Y.—*Hinge for Covers for Tea Kettles and Hollow Ware.*—April 16, 1867.—The flanged stem of the lid enters radially, and turns laterally in the slot on the mouth of the kettle; a nib alongside the slot fits into a recess under the lid, and keeps the stem in the slot.

Claim.—First, the slot C entering first radially from the opening of the kettle top, then turned laterally as at C', in combination with the stem *g* of the cover, provided with a continuously-projecting ledge or flange *h* or its equivalent, arranged and operating substantially as set forth.

Second, the nib *d*, in combination with the recess *f* on the cover, arranged and operating in the manner and for the purpose shown and described.

63,875.—First, a H. EMERY, New York, N. Y.—*Hydraulic Press.*—April 16, 1867.—The smaller ram plunger inside the larger one is first connected with the water, and raises the platform to a certain height, when the lifting arms of the other plunger and its valve are thrown in operation, and the platform raised by the two rams in conjunction. In its descent the lifting arms of the larger ram are dislodged from its head, and the press is ready for another charge.

Claim.—First, a plurality of rams, arranged so as to operate consecutively upon the plateau of a press, substantially as set forth.

Second, operating or moving the plateau of a press by means of two or more columns of water or other liquids whenever these columns of water or liquid are so arranged that the plateau is moved through a part of its stroke by one more of the acting columns, but not all, and through the rest of its stroke by a part of or the whole of the columns so used.

Third, the arrangement of two or more concentric rams placed one within the other, and enclosed within a fixed cylinder to operate upon the plateau of a press, substantially as shown and described.

Fourth, the arrangement of the supply pipe H, with the fixed cylinder G and the two rams D E, for the purpose of operating the smaller ram E, while the larger one remains stationary, substantially as set forth.

Fifth, the arrangement of the supply pipe H, sliding packing I and compress ram D, substantially as and for the purpose set forth.

Sixth, the arrangement of the two sliding packings F I, packing ring G, and the compress ram D, substantially as described.

Seventh, the two supply pipes H K, arranged and combined with the fixed cylinder C, packing and compress rams E D, to operate substantially as shown and described.

Eighth, the shoulder or stop *e* or O on the packing ram E, with the nut Q in the compress ram, arranged to operate substantially in the manner as and for the purpose set forth.

Ninth, the two supply pipes H K, with the valve S, arranged to operate in connection with the packing and compress rams E D, substantially in the manner as and for the purpose specified.

Tenth, the levers V V, sliding wedges U U and and valve S, arranged to operate in the manner substantially as and for the purpose set forth.

Eleventh, the lifters X X, plateau P, and compress ram D, combined and arranged to operate substantially as and for the purpose specified.

Twelfth, the combination of the lifters X X, compress ram D and levers Y, arranged to operate substantially as and for the purpose set forth.

Thirteenth, the sliding wedges V V, plateau P, levers W W Y Y spring *f'* and valve S', combined and arranged to, operate substantially as and for the purpose specified.

Fourteenth, the plateau P and lifters X X, in combination with the levers Y Y, and the springs B', or their equivalents, arranged to operate substantially as and for the purpose set forth.

Fifteenth, the spring B', arranged with the levers Y Y, stops *w* and the cords *v*, to operate substantially as and for the purpose specified.

Sixteenth, the lifters X X, pawls Y' at the ends of the lifters X X, the recess *i* in the compress ram D, and the fixed rests *j j*, all combined and arranged to operate substantially as and for the purpose specified.

Seventeenth, the arrangement of the clamp frame D', wedge E' and the clews or loops *e' e'*, substantially as and for the purpose set forth.

63,876.—WILLIAM A. FIELD, Boston, Mass.—*Blacking Box Holder.*—April 16, 1867.—The box is clamped in the recess by the thumb screw. The pivoted cover shuts against a friction block of rubber.

Claim.—The combination of devices constituting the improved blacking-box holder, viz: the box A, its handle *a*, cover *b*, elastic block *c* and screw *f*, arranged substantially as specified.

63,877.—L. S. FISHER, Brodhead, Wis.—*Hanging and Guiding the Harness in Looms.*—April 16, 1867.—To insure true horizontal position and vertical movements to each of the leaves of the harness, each leaf is connected at the center of its top bar to both ends of the leaf next but one to it, by cords passing over shears in the frame above. The end guides of the heddle frames are loosely hung by cords at top and bottom, and are adjustable.

Claim.—First, hanging the harness in looms, in the manner substantially as shown and described, and for the purpose set forth.

Second, the adjustable guides F, in combination with the harness B B, constructed and operated in the manner as shown and described and for the purpose set forth.

63,878.—JACOB G. GOOD, Raps, Pa.—*Dung Hook.*—April 16, 1867.—The teeth are attached to the angular frame, to which handles are affixed. It is used for moving and piling dung.

Claim.—An improved dung hook, constructed substantially in the manner herein shown and described, and for the purpose set forth.

63,879.—R. J. P. GOODWIN, Manchester, N. H.—*Construction of Strainers.*—April 16, 1867.—The strainer has a flange turned on the wire cloth which is clamped between two rings of sheet metal; a hem on one encompassing the edge of the other.

Claim.—A strainer constructed with a flange formed as described and shown in "view c."

63,880.—ROBERT C. GRAVES, Barnesville, Ohio.—*Ventilating Apparatus for Railroad Cars.*—April 16, 1867.—The ventilating pipe has ogee bends through the roof of the car with funnel ends and gauze screens for the passage of air. Vertical pipes convey the foul air from the pipe and crescent-shaped openings with deflectors cause circulation to and from the pipe.

Claim.—The construction and arrangement of the supplementary outlets E E, having deflector *n* upon the pipe *c*, whose ends are curved upward and pass out of the top of the car, and whose under side is provided with crescent-shaped openings *e e*, having air guides *d d* inclined in opposite directions upon each side of the middle partition *b*, as herein set forth for the purpose specified.

63,881.—ALVA J. GRIFFIN, Lowell, Mass.—*Hydrocarbon Burner.*—April 16, 1867.—Improvement

on his patent of July 3, 1866, No. 56,143. The water and petroleum entering through the supply pipes which are regulated by stop cocks, flow through orifices in the ribs of the chamber above the retort, and being vaporized by heat, flow through the burner and the perforated pipe below. The steam mingling with the petroleum gas under the influence of heat resolves into its gaseous elements and passes through the coiled pipe above into the gasometer.

Claim.—First, constructing the chambers D E with longitudinal ribs B C and lateral ribs *b b b b* perforated with orifices, substantially in the manner and for the purpose set forth.

Second, the gas chamber or retort F when combined with the chambers D and E, substantially in the manner and for the purpose set forth.

Third, the coil pipe J, or its equivalent, when arranged in combination with the gas retort F and chambers D and E, substantially as and for the purpose set forth.

63,882.—ADAM P. GRUGER, Lancaster, Pa.—*Device for Cutting Washers.*—April 16, 1867.—The center being fixed, the knives revolve in concentric circles, cutting the washers or rings. The knives are adjustable by the sliding socket head on the horizontal bar.

Claim.—The manner of constructing the sliding socket head D with its open knife slot *d* and single binding screw F to each, thereby making the knives doubly adjustable, in combination with a horizontal bar C, united firmly with the vertical brace shaft A and center point B, in the manner and for the purpose specified.

63,883.—M. J. HAINES, Bristol, England, assignor to R. R. and J. H. WHITEHEAD, Great Britain.—*Driving Belt.*—April 16, 1867.—The belt is formed of narrow slips secured longitudinally side by side, their width forming the thickness of the belt.

Claim.—First, the construction and use of driving straps or bands composed of a number of longitudinal straps of leather, hide, or other suitable material of a width equal to the thickness of the intended strap and placed side by side and secured together in any convenient manner.

Second, the peculiar modes of fastening or securing together a number of longitudinal strips of leather with a view to forming an edge laid driving strap or band, substantially as hereinbefore described and illustrated by drawings.

63,884.—CHARLES HARDY, Biddeford, Me.—*Machine for Grinding Top Cards and the Workers, Strippers, and Licker-in Cylinders of Carding Machines.*—April 16, 1867.—The grinding emery wheel has longitudinal reciprocation on its slotted shaft by an enclosed screw therein, and grinds simultaneously two or more top flats and two or more cylinders. Each top flat reciprocates in a guide tangential to the wheel by a connecting rod to a crank pin. The bearings for the ends of the flats and of the cylinders are adjustable radially to the grinding shaft.

Claim.—The combination as well as the arrangement of the rotary grinder and mechanisms for supporting, grinding, and operating two or more top cards so as to cause them at one and the same time while being ground to have reciprocating motions in directions transversely of them and in planes tangential to the curved surface of the grinder, the whole substantially as specified.

Also, the combination of the box *x'* and its lateral adjusting mechanism with the carriage *z'* and its longitudinal adjusting mechanism.

Also, the combination of the plate *y'* and its pivot *b²* with the box X' and the carriage Z' and their mechanisms for effecting their longitudinal and lateral adjustment, as set forth, such employment of the plate *y'* and its pivot serving to enable the box to turn so as to readily adjust itself to the bearing of a card cylinder when placed within the box.

Also, the adjustable cap *f²* and the box *x'*, as made and applied together as set forth.

Also, the combination as well as the arrangement of the grinder and its operative mechanism and mechanisms for supporting and operating one or more top cards and one or more cylindrical cards on opposite sides of such grinder, in manner and for the pur-

pose of grinding such top cards and cylindrical cards at one and the same time by such grinder, substantially as described.

Also, in combination with each set of top card carriers and their slides, mechanism for supporting such set of carriers and moving them toward the shaft of the grinder, under circumstances and in manner substantially as hereinbefore specified.

Also, the combination of the rotary cleansing brush, its operative mechanism, and the adjustable gauge bar applied to the frame A, and for the purpose as set forth.

63,885.—C. HARRIS and P. W. ZOINER, Cincinnati, Ohio.—*Fireplace.*—April 16, 1867.—The interior fire pot with an open front has a deflecting dome above, which brings the smoke again in contact with the flame.

Claim.—The arrangement in a shell or case A open in front of the interior fire pot B, having a grated front C and recessed crown E, closed rearward and laterally and open in front, substantially as set forth.

63,886.—JAMES HARRIS, Kansas, Ill.—*Bridle.*—April 16, 1867.—The cheeks of the head stall pass through tubes attached to the bit and are united with supplementary reins, the driving reins being hung to the bit.

Claim.—The tubes F secured to the bit E, receiving the check straps G, having holding collars I, for the purpose described, substantially as specified.

63,887.—CHARLES T. HARVEY, Tarrytown, N. Y.—*Car Propelling Apparatus.*—April 16, 1867.—Improvement of his patent of May 8, antedated April 6, 1866. The body of the compound ferrule consists of two side sections bolted together over the balls of the socket joints, and the larger central anti-friction roller. The ferrule traverses a suitable channel, and has a spring carrying an anti-friction roller, which passes through the top opening of the channel to keep the main roller vertical. This bar bends down to give way to obstacles.

Claim.—First, the combination of the lateral rollers E E with the large roller B, the axis of the latter being at a right angle with the axis of the former, substantially as shown.

Second, the ferrule A', composed of a conical forward part O, a frame D, and a rear part N, the several parts being connected by joints which permit of lateral motion of such parts, substantially as herein set forth.

Third, the construction and arrangement of the ferrule A, or its body or portion that contains the anti-friction rollers in sections 1 2, substantially as set forth.

Fourth, the yielding finger or ferrule guide P, substantially as set forth.

Fifth, the combination of the hook M, connected to the part D, as shown, the conical shell N, and the conical end Q' of the rope or cable A', substantially as shown.

Sixth, the combination of the link G, connected to the part D, as shown by a universal joint, with the conical forward part O of the ferrule, substantially as shown.

63,888.—CHARLES T. HARVEY, Tarrytown, N. Y.—*Propelling Cars.*—April 16, 1867.—The operative plates on the cable which engage projections on the cars pass along guide ways of the track and a fixed helical guide surrounding the revolving drum. Curved guides conduct these plates from the track guide to that of the drum, and vice versa.

Claim.—First, the combination of a cable-driving drum A, with the stationary guides B, to control and guide a propelling cable while passing around such driving drum, substantially as set forth.

Second, the twisting conducting guide E, between a driving drum and railway track or any conducting pipe or guide, substantially as set forth.

Third, the construction and arrangement of a driving drum for propelling cables of two or more independent stationary guides coiled in opposite directions, substantially as set forth.

Fourth, the construction and arrangement of propelling cables with heads or ferrules whose operating faces or spurs project at right angles from the heads, substantially as described.

Fifth, the sliding heads or ferrules for keeping a

moving cable in proper position and preventing it from turning in its guide, substantially as set forth.

Sixth, combining with the spiral guide B anti-friction rollers for relieving the cable of friction, substantially as described.

Seventh, the hollow pipe K, constructed and arranged for conducting a propelling cable, substantially as set forth.

63,889.—CHARLES L. HAWES, Titusville, Pa.—*Hotel Register.*—April 16, 1867; antedated January 17, 1867.—Explained by the claim.

Claim.—A hotel register book with the margin of its leaves occupied by advertisements, substantially as described.

63,890.—JOHN F. HIRSCHIY and WILLIAM M. McDONALD, Wooster, Ohio, assignors to themselves and A. McDONALD.—*Harvester Rake.*—April 16, 1867.—The rake is reciprocated along the platform by adjustable jointed connections to a wrist on an exterior clutch wheel. The rake head moves on a curved rod, and the elevation of the rake to make its backward movement and its depression for the effective stroke are effected by the contact of its rear extension prong with guides and latches upon the rear of the platform.

Claim.—First, the attachment of the raking apparatus to an adjustable wrist on an exterior clutch wheel on an outer end of the carriage axle, substantially as and for the purpose described.

Second, the arrangement of the pitman C, rocking arm E, connecting rod G, and clasp H, with universal joint connections, the pivotal point of the rocking arm F being adjustable to vary the length of throw, substantially as described.

Third, the combination with the rear extension prong j of the rake head of the curved rod L, the bearings K M, latch N, and platform guide o o, substantially as described.

63,891.—ROBERT HOADLEY, Ansonia, Conn., assignor to N. C. STILES, S. S. WILCOX, E. N. CROCKER, F. O. TUCKER, and W. W. TUCKER, West Meriden, Conn.—*Spinning Top.*—April 16, 1867.—The hollow metal top is ballasted at its equator.

Claim.—Ballasting the thin top A B by the addition of the extra weight D, or its equivalent, distributed around the periphery at or near the zone of greatest diameter, substantially as and for the purposes herein specified.

63,892.—ROBERT J. HOLLINGSWORTH, Cincinnati, Ohio.—*Device for Seaming Sheet Metal Cans.*—April 16, 1867.—The metallic cylindrical former receives the sheet-metal cylinders to be soldered; an adjustable solder trough clamps the suture, and a soldering iron passes along to complete the operation.

Claim.—The tube or form C, in combination with the solder trough F, arranged for joint operation in connection with a soldering iron H, substantially as and for the purpose specified.

63,893.—A. J. HOLMES, Saratoga Springs, N. Y., assignor to WELLS L. ROBBINS, same place.—*Window Cornice.*—April 16, 1867.—The casing of the cornice is glazed to protect it from discoloration and abrasion.

Claim.—A cornice for interior decoration or for windows, doors and similar objects, constructed substantially as herein described.

63,894.—B. B. HOTCHKISS, New York, N. Y.—*Ox-bow Pin.*—April 16, 1867.—An improvement on the patent of Andrew Hotchkiss, July 17, 1849. Explained by the claims and illustration.

Claim.—First, the hollow ends of the arms B¹ B², arranged relatively to the main body A and to the trunnions b, substantially in the manner and for the purposes herein set forth.

Second, the coiled spring c, with extended ends operating on the arms B¹ B² b¹ b², substantially in the manner and for the purposes herein set forth.

Third, the studs A³ A⁴, in combination with the spring C and arms B¹ B² b¹ b², and the cheeks A¹ A² and body A, substantially in the manner and for the purposes herein set forth.

63,895.—ADRIAN HOUGET, Verviers, Belgium.—*Machine for Raising a Nap upon Cloth.*—April 16, 1867.—The cloth is teased in opposite directions on

the same side without removal from the machine, and may be presented twice to each teasing cylinder. It does not pass under the cylinders so as to catch the falling dirt, &c., and its napped surface is uppermost for inspection at all times.

Claim.—In machines for raising the nap on cloth, by means of two teasing drums, the arrangement, substantially as herein shown, of the teasing drums, conducting and stretching rollers, and suitable gear mechanism for imparting to the cloth its move to, against, and from the said teasing drums, and also to and from the receiving basin, in the manner and for the purposes set forth.

63,896.—JOSEPH E. HOVER, Philadelphia, Pa.—*Printing Paper.*—April 16, 1867.—The paper is coated with a size composed of starch, 4 parts; water, 240 parts; and carbonate of lime, 12 parts.

Claim.—A printing paper, the surface of which is coated with carbonate of lime, or its equivalent, for purpose specified.

63,897.—DAVID HOWARTH, Portland, Me.—*Folding Chair.*—April 16, 1867.—The legs are pivoted by a rod at their points of junction and are hinged to the seat in front; the bolts at the rear of the seat slide in grooves in the back posts when opening or shutting.

Claim.—The cross-legged chair, as described, when, by means of the pivot *c*, pivots *d*, grooves *k k*, and pins *m m*, it may be folded in the manner described and set forth.

63,898.—MATTHIAS H. HOWELL, New York, N. Y.—*Soap Frame.*—April 16, 1867; antedated March 27, 1867.—The base is mounted on wheels, and has a rabbet around its upper edge containing a rubber packing against which the sides are clamped. The frame is formed of plates bent at right angles and joined together at diagonal corners by hinged clamps.

Claim.—First, the frame divided vertically and diagonally, through two corners, into two parts or halves, substantially as herein set forth, for the purpose specified.

Second, the hinged locking bars *e* and lugs *n*, arranged with reference to each other, and operating to lock the two parts or halves of the frame together, substantially as herein set forth.

Third, the packing *u* within the rebate around the base or bottom *A*, in combination with the diagonally-divided upright portions of the frame, substantially as herein set forth, for the purpose specified.

Fourth, the diagonal trusses *w*, arranged with reference to the diagonal crossed braces *h h*, and with the sides of the frame, substantially as herein set forth, for the purpose specified.

63,899.—BARNABAS HUNT, Farmland, Ind.—*Broom Head.*—April 16, 1867.—Any number of tubes required are soldered together, and the broom corn is secured therein by cement or elastic bands. The center tube is made longer than the others to hold the handle.

Claim.—As a new article of manufacture, a broom head, consisting of a series of tubes *a*, made of sheet metal, and having the central longer than the others to receive the handle *f*, as herein shown and described.

63,900.—JOHN W. HUTCHINGS, Bridgeport, Conn., assignor to himself and JOHN H. EYRE.—*Sash Supporter.*—April 16, 1867.—The cam binds upon a plate applied to one of the retaining strips of the frame instead of directly upon the sash.

Claim.—The combination of the strip *B* and eccentric or cam lever *C*, as a sash supporter, substantially as and for the purpose described.

63,901.—WILLIAM JAMES, Richmond, Va.—*Bridge.*—April 16, 1867.—The suspensory wires are carried through ducts in the pier large enough for the passage of men and materials, around a cylindrical block built in said pier, and are anchored around windlasses; the whole gives an extended bearing without any point of extreme strain.

Claim.—First, the construction of the towers or supports of the bridge, with passages or flues through which the suspension rods, wires, or chains are passed, in such manner as to form extended frictional bearings

for said rods, wires, or chains, substantially as described.

Second, the central drum or shaft in the tower, around which the suspension wires or rods are passed, substantially as described.

Third, forming the sides of the passages or flues on which the suspension wires rest, with an extended flattened bearing surface, to adapt them to receive any desired number of such wires or rods arranged side by side in the same horizontal plane, substantially as described.

Fourth, securing the ends of the wires or rods, which pass through the perforated tower at a point or points at or near the base of said tower, substantially as described.

Fifth, the tight wires, rods, or chains, forming the bottom of the bridge and passing through the perforated tower thereof, in combination with the suspension rods or chains, substantially as described.

Sixth, the manner of applying the tight wire hand rail, whereby it is made to form an additional support to the bridge, as described.

Seventh, the employment of one or more suspension rods or wires *i*, intermediate between the tight wire and suspension rods or wires *h* and *k*, substantially as described.

Eighth, the arrangement of the suspension wires, rods, or chains *i k*; tight hand rail and bottom wires *g h*, and vertical ties or suspenders *l*, in combination with the perforated towers or supports *A*, in the manner and for the purpose described.

63,902.—JOHN G. JEFFREY, South New Berlin, N. Y.—*Medical Compound.*—April 16, 1867.—A counter irritant and stimulant, composed of gum guaiacum, 1 oz.; crude turpentine, 1 oz.; alum, 1 oz.; capsicum, $\frac{1}{2}$ oz.; saltpeper, 1 oz.; sassafras bark, 1 oz.; and wine, 1 gallon.

Claim.—The improved medical compound, composed of the ingredients in substantially the proportions herein specified.

63,903.—GEORGE JONES, Sangerties, N. Y.—*Coffee Pot.*—April 16, 1867.—Improvement on patent of Thomas Bishop, November 1, 1859. The condenser above returns the fluid to the coffee below. A ball in the spout forms an automatic valve by rolling from its seat when the pot is tipped.

Claim.—First, in combination with the space *E*, formed, constructed, and arranged substantially as specified, the tube space or passage *f*, substantially as and for the purpose specified.

Second, in combination with the body *A*, constructed with a space *E*, cylinder *F*, and spout *C*, the ball valve *H*, the whole arranged in the manner substantially as herein set forth.

63,904.—HENRI JUGE, New York, N. Y., assignor to himself and THOMAS H. ROCKWELL, same place.—*Eyeletting Machine.*—April 16, 1867.—Designed for the insertion and clinching of eyelets in cloth, &c. The punch cuts the hole and then serves as a central guide to receive the eyelets and hold them while being clinched. An adjustable stud gages the spaces between the eyelets while in course of insertion.

Claim.—First, the eyelet clinching head, having a tubular punch or cutter *f* applied to it, in combination with a perforated clinching head, having a pin *h* through it, said parts being arranged and operated so as to cut a hole through cloth or other substance, insert and clinch an eyelet at one operation, substantially as described.

Second, the clinching head *f'* provided with a tubular cutting punch *f*, substantially as and for the purposes set forth.

Third, in combination with eyelet punching and clinching devices, constructed substantially as described, the movable tube *i*, and movable stem *h h'*, with springs *k l*, and cam lever *B*, arranged so that they shall operate substantially as described.

Fourth, the adjustable pin *C*, applied to the cam head *B'* of lever *B*, for moving the stem *h h'*, substantially as described.

Fifth, in combination with the machine constructed as herein described, the adjustable gauge pin *v*, substantially as set forth.

Sixth, in combination with the machine constructed

as herein described, the adjustable gauge E, and adjustable gauge pin *v*, substantially as described.

63,905.—JAMES M. KEEP, New York, N. Y.—*Paper Fastening*.—April 16, 1867.—The split tube attached to the upper disk clinches below the conical plate within the lower disk.

Claim.—The plate A, provided with a divided tube B, when used in combination with the plate C, provided with the conical protuberance D and the inner plate E, in which is formed an opening F, to receive the tube B, the cone D serving to spread and secure the sections of the divided tube beneath the plate E, as and for the purpose specified.

63,906.—M. H. N. KENDIG, Washington, D. C.—*Garment Fastener*.—April 16, 1867.—The small chain connects two studs attached to the glove secured by a hook at one end, and at the other end adjustable by attachment to the slotted prong on the stub.

Claim.—The within described fastening device, composed of stubs or plates A and A', the latter being provided with a suitable retaining device D within which is adjustably secured a chain B, or equivalent device, the whole constructed and arranged substantially as described.

63,907.—O. G. KENNEL, EZRA H. SMITH, and G. L. MORRISON, New York, N. Y.—*Lamp Stove for Cooking*.—April 16, 1867.—Flues rise from the chamber whose perforated bottom forms the ceiling of the lamp chamber. The flues surround the oven except an upper central aperture, at which point the caloric current escapes into discharge pipes.

Claim.—The chambers H, in the case A, their lower ends opening into the chamber G, their outer sides placed a short distance from the side plates J, their upper edges extending upward within the box A, and provided with escape pipes L, said case A resting upon the perforated plate F, of the base D, when all are constructed and arranged as herein set forth, for the purpose specified.

63,908.—B. N. LAMPMAN, Rutland, Vt.—*Concrete Pavement*.—April 16, 1867.—Coarse gravel and coal tar are mixed together to form a layer three inches thick, which is compacted. This is covered with 1½ inches of concrete, consisting of 3 parts of iron furnace cinders, 1 part of coarse sand, mixed with coal tar; slaked lime is then sifted on.

Claim.—The concrete pavement herein described and set forth.

63,909.—S. M. LEE, New London, Iowa.—*Car Brake*.—April 16, 1867.—The pressure together of the cars, caused by checking the engine, causes their sliding draw-heads as they are pushed in to operate a lever connected with the brakes. This lever has its fulcrum on the shoulder of a longitudinal bar on which it rests. When backing the train, the lever is raised from the shoulder by a cord passing to the engineer, and the inward movement of the draw-head does not operate the brakes. A forward movement of the train resets the lever.

Claim.—First, the device for disconnecting the self-acting brake, when backing the train, consisting of the rope or chain *m*, bent shaft *l*, chain *t*, lever *h*, suspended bar *d*, provided with a shoulder *c* and lever *b*, to which the brakes are attached, or their equivalents, substantially as described.

Second, the rod F, with hook-shaped end, to which the chain *r* is attached, for the purpose of disconnecting the self-acting brake device, and attaching the brakes to the common brake rod and wheel, in combination with the above, substantially as described.

Third, the combination of the sliding bar E of the above described self-acting brake device, formed arm *p* and rollers *n o*, with the rope or chain *m*, substantially as and for the purposes described.

63,910.—HORATIO S. LEWIS, Communipaw, N. J.—*Skinning Cattle*.—April 16, 1867.—The hide is ripped as usual, and the head laid bare; the horns being attached to a ring in the floor, a rope is fastened round the neck of the hide, and running over the pulley on the floor passes round the adjustable drum on the horizontal shaft, which is secured by a

clutch. An endless rope on a grooved wheel works the shaft.

Claim.—The employment of mechanical appliances for removing hides from animals, substantially as and for the purpose described.

63,911.—GEORGE H. LUPTON, Cleveland, Ohio.—*Swing*.—April 16, 1867.—Elevating heads surmounted with bars slide on the ropes to keep the child from falling out.

Claim.—The cross-bars B, heads C, in connection with the seat and swing ropes, substantially as and for the purpose set forth.

63,912.—SETH MARCH, Norfolk, Va.—*Corn Weeder*.—April 16, 1867.—The landside is elongated to steady the machine, and together with a shovel-shaped mold board is attached to a cast-iron frame.

Claim.—The frame A, share B and detachable heel C, when these parts are constructed, arranged and combined, as herein specified.

63,913.—JOSEPH C. MARES and LEWIS G. ECKELS, Washington, D. C.—*Cleansing Water Pipes*.—April 16, 1867.—The pipe from the main has a stop cock beyond which it is forked; the branch leading to the house has a strainer, and the other branch curving up, has a cock and ends in a coupling for hose attachment.

Claim.—First, the arrangement of the pipes B F C, stop cocks D G and strainer L, constructed and operating substantially as described.

Second, the combined arrangement of the box A, pipes B C, cock G, rod H and lid, operating as described.

63,914.—JABEZ F. MASON, Newark, N. J., and JOB JOHNSON, Brooklyn, N. Y.—*Door Spring*.—April 16, 1867.—The reversible toothed bracket receives a cylindrical ratchet that holds a spring, and can be slipped endwise to connect or otherwise. By reversing the bracket the door can be kept either open or shut.

Claim.—First, the bracket *g*, formed with teeth, in combination with the cylindrical ratchet *h* and spring *d*, substantially as and for the purposes set forth.

Second, the nut *a*, in combination with the cylinder *h*, spring *d* and bracket *g*, substantially as and for the purposes set forth.

63,915.—WILLIAM A. MCINTIRE, Springfield, Mass.—*Machine for Making Cartridge Shells*.—April 16, 1867.—The blank is placed in a cavity of an intermittingly rotating disk, from which it is forced by turn into a reciprocating slide and rotating tubular spindle, where it is trimmed by an advancing knife. It is conducted by the punches, disk and slide to the heading die beneath, and then discharged.

Claim.—First, the combination of the plunger and die for drawing the shell, the slide or equivalent for delivery of the same, and the trimming device for the purpose specified.

Second, in combination with the above, the rotating disk U and heading device, arranged substantially as described.

63,916.—JOHN W. MCINTIRE, Memphis, Tenn.—*Cotton Press*.—April 16, 1867.—The follower is depressed by a transverse bar to which the windlass cords are attached; the heads on which these cords are coiled have clutch connections to their shaft, which are thrown out by a lever to allow the ascent of the follower through influence of its weighted balance ropes. The windlass shaft is rotated by pawl levers. The hinged doors are retained by bars operated by a lever to catch their lower edges.

Claim.—First, the arrangement of the upper box, provided with slotted sides C C, with the follower and bar S, side doors D D, provided with flanges *f f* and end doors D' D, the several parts being constructed and used substantially as and for the purpose specified.

Second, the arrangement of the shaft G with its attachments with the cords *t t*, follower K, bar S, and cords *q q* with weights P P attached, for the purpose of operating the follower in both directions, substantially as specified.

63,917.—JOHN S. McMILLIN, Pittsburg, Pa.—*Application of Steam Power to the Capstans of Ves-*

sels.—April 16, 1867.—The freight-hoisting engine is connected by gearing to the capstan.

Claim.—Rotating a capstan placed on deck of a boat by means of an auxiliary engine, when said engine and capstan are placed forward of the steam boilers of said boat, substantially as hereinbefore described and for the purposes set forth.

63,918.—M. MELLEN, Richland Station, N. Y.—*Stump Extractor.*—April 16, 1867; antedated April 11, 1867.—The lifting chain passes over a pulley suspended from a bridge frame erected above the stump, and planted in self-adjusting feet. The hoisting apparatus is mounted on a truck, and has hand cranks and multiplying gearing to draw upon the lifting chain.

Claim.—First, the combination of the support D and pin *a* with the frame A of the machine, and the adjustable feet *b*, attached to the lower extremities of the support, substantially in the manner and for the purpose herein specified.

Second, the combination of the main shaft F and clutch K with the loose collar *h* and hook *i*, operating substantially as and for the purpose herein shown and described.

Third, the application to the stump extractor of two or more drums L and M, substantially as and for the purpose herein specified.

Fourth, the adjustable slotted bearings of the axles H I and K, for the purpose of throwing any portion of the machine in or out of gear, substantially in the manner herein shown and described.

63,919.—CHARLES T. MELVIN, Providence, R. I.—*Razor Strap.*—April 16, 1867.—The flexible strap is wound up by a spring operating on the shaft to which the strap is affixed. A brush on the under side of the lid cleans the strap.

Claim.—A flexible razor strap, capable of being drawn into its receiver by means of a spring.

Also, a brush and a swivel joint in connection with a flexible razor strap, all substantially as set forth and for the purpose specified.

63,920.—JEROME B. MELVIN, Lowell, Mass., assignor to himself and EDWARD B. HOWE, same place.—*Fertilizing Bung for Casks, &c.*—April 16, 1867.—The cavity in the bung communicates with the atmosphere and with the interior of the barrel by separate passages. The valve in the cavity rises freely to admit air, but resists the passage of gases from the barrel.

Claim.—The combination of the vent passage *e*, the cavity I, the valve B, its seat *o o*, the pressure chamber H, and pressure passage *f*, with the bung or vent plug A A, the whole arranged substantially as herein set forth and shown for the purpose specified.

63,921.—JOHN MITCHELL, West Farms, N. Y.—*Matting for Floor Covering.*—April 16, 1867.—The warp is of jute and wool twisted together, and the filling is of Manila thread.

Claim.—An improved matting, formed by the combination of woolen, jute, and Manila or Russian grass with each other, whether woven plain or twilled, substantially as herein described, as a new article of manufacture.

63,922.—D. K. MILLER, Bernville, Pa.—*Alarm Lock for Tills.*—April 16, 1867.—The lock bolts are raised by others beneath to free them from the lock catch. The slides beneath the draw operate two sets of bell crank levers to raise or lower the under series of bolts, which are singly reversible to connect to either series at will, so that the lock can be arranged to require specific movement or rest of any one or all the slides to free the drawer. The outward movement of the drawer, when locked, sounds the alarm, and its inward movement resets the alarm.

Claim.—First, the two series of bolts H K, fitted in boxes C J, attached respectively to the till and to the under side of the counter or desk, and arranged in connection with a frame I, to operate substantially in the manner as and for the purpose set forth.

Second, the two series of levers D D', connected by rods *b* and arranged with springs E, rods F, and slides G, or equivalent means to operate in connection with the bolts H K, substantially as and for the purpose specified.

Third, the bell hammer or rod M, provided with the springs *k k'*, and operated through the medium of the shaft *m*, provided with the arms *l o*, the projection *p* at the under side of the counter or desk, the arm N, fitting in the notch in the rod, and the pin *r*, extending from the side of frame I, all arranged so that the bell hammer or rod will be set each time the till is shoved inward, and the hammer or rod liberated and the alarm sounded each time the till is slightly drawn outward in an unlocked state, substantially as set forth.

63,923.—JOSEPH A. MILLER, New York, N. Y.—*Steam Generator.*—April 16, 1867.—The annular water chamber beneath the grate is connected with the water chamber above the fire space by two concentric series of vertical pipes, the inner series discharging centrally beneath a deflecting plate. The upper water chamber is traversed by vertical flues near its outside. The top of the fire chamber is conical.

Claim.—The combination of the water base B², grate A², steam generating tubes C² and jacket G² to the fire-box roof E², cylinder or upper chamber G², return water pipes D², and smoke tubes I², the whole being arranged relatively to each other, substantially as specified.

63,924.—JOHN L. MITCHELL, Buffalo, N. Y.—*Hotel Register.*—April 16, 1867, antedated December 5, 1866.—The book is interleaved with blotting paper upon which advertisements are printed.

Claim.—A hotel register book with interleaves of bibulous paper with advertisements displayed thereon, substantially as specified.

63,925.—S. A. MITCHELL, Alstead Centre, N. H.—*Apparatus for Feeding Liquid to Evaporating Pans or Boilers.*—April 16, 1867.—The floats in the pans regulate the flow from the tank by an oscillating spout having a valve which is brought in contact with the spigot mouth. The immersed buoy equalizes the flow under different pressure of the liquid.

Claim.—First, the invention of a self-adjusting feeder to any number of boilers required from one faucet or feed pipe by means of a buoy or buoys E acting on the flow of liquid by means of a stopper Q, or any similar device.

Second, the immersed buoy N, connecting rod M, the beam K, standard L, the pivot *m* in standard L, the connecting rod J, the eyebolt *n* in cistern A, operating on conductor D, as herein set forth.

Third, the small buoy H, acting by means of the beam *b* upon the valve U for the purpose of controlling the flow of fluid in the aperture V, as herein described.

Fourth, the combination of the buoys E H and N, conductors D and O, the standards F and L, sockets G *c* and *d*, the beams K and *b*, the connecting rods J and M, the pivots P *m* *a* and *c*, the brace C, stopper Q, valves U and *f*, the eye bolt *n*, and the perforated guard *g*, arranged and operated as herein set forth, or in a manner practically the same for the purpose specified.

63,926.—GEO. R. MOORE, Lyons, Iowa.—*Coal Stove.*—April 16, 1867.—The fire chamber is enclosed in an outer casing and is surmounted by an adjustable cover which acts as a damper, and is raised or lowered to regulate the speed of combustion.

Claim.—The hinged cover C, so arranged and operating as to smother the fire and check combustion when turned down to a horizontal position, and to form a diving flue between the combustion chamber and the smoke pipe when turned to a vertical position, substantially as described.

63,927.—JOHN MORGAN, JR., Wheeling, W. Va.—*Bolt and Rivet Machine.*—April 16, 1867.—The heated end of the bar is thrust between the side dies to the head die, which are all in their backward position. The rotation of the cam shaft forces forward the side dies with cutter plates and afterward the heading die whose sides are first driven down to enclose the head and the central rod subsequently. The side guides are operated by inclined plates which reciprocate in a transverse direction in slots of the die rods.

Claim.—First, the combination of the die stocks Y,

lever rods O, stirrups and cams, substantially as arranged and set forth.

Second, the arrangement of the header V, plunger U, cams F and E, loose stirrups and thumb-screws A B.

63,928.—H. L. MORSE, New Bedford, Mass., assignor to S. A. MORSE, same place.—*Turning Lathe.*—April 16, 1867.—The head and tail stocks are supported on a plate running the whole length of the lathe and oscillating on its center by a crank screw at the head. A scale at the foot shows the inclination from the shears which support the slide rest. At starting, the tool is set to a gauge arm on the tail stock, which indicates the initial position of the tool face.

Claim.—First, the method of adjusting the movable plate C, consisting of a combination with each other of the circular projections *d d*, grooves *e e*, screws D, and nut *f*, substantially as herein shown and described.

Second, the arrangement of the scale or index to the rear end of the lathe bed, in combination with the adjustable plate C, substantially as shown and described for the purposes herein set forth.

Third, the gauge G, constructed of a right-angular bar pivoted to the foot stock F, in combination with the adjustable plate C, and adapted for the purpose described when the tool is set to the point of its shorter arm, as herein specified.

63,929.—S. A. MORSE, New Bedford, Mass.—*Clamp.*—April 16, 1867.—The sliding plate is adjustable by a screw on the stock and carries the lever with the presser foot. The lever is operated by a cam under its free end.

Claim.—The stock A provided with an upright ledge or bearing surface *a*, in combination with the sliding plate B provided with the lever C having the self-adjusting plate D attached and operated by the cam E, or its equivalent, substantially as and for the purpose herein set forth.

63,930.—EDWARD WILLIAM, and OLIVER K. NASON, Ormeville, Me.—*Draft Attachment for Vehicles.*—April 16, 1867; antedated April 11, 1867.—A cushioned wooden collar buckles at top and bottom and is snapped to rods which run through guides below the thills and are bolted to the single tree.

Claim.—The arrangement of the straps E, snap hooks F, rods C, in combination with the whiffletree B and collar D, and operating in the manner and for the purpose herein specified.

63,931.—GEO. W. OVIATT, Potter Center, N. Y.—*Wagon Box.*—April 16, 1867.—The side pieces are hinged to the bottom and are secured above by spring catches attached to the end boards.

Claim.—First, securing the sides of a wagon box to the bottom by means of the bolts H and I, substantially as specified.

Second, securing the end boards of a wagon box in their places by the use of the spring catch D and catches E and E, as herein specified.

63,932.—CALVIN H. PAINE, Providence, R. I., assignor to himself and WM. D. HILTON, same place.

Gate.—April 16, 1867.—The gate is formed of slats acting upon the principle of the "lazy tongs." Its lower rear corner is pivoted to the post and its upper rear corner to a vertically sliding bar which is extended beneath the ground and connects with a system of levers by which a vehicle approaching from either direction opens the gate and passing through closes it, by T-projections of the levers rising above the surface of the ground.

Claim.—The combination of the gate, or lazy tongs, and mechanism for opening and closing it by means of a carriage, substantially as described.

Also, the combination as well as the arrangement of the two sets of levers D D and F F, the connection piece *h*, and the series of T pieces *l*, the whole being for operating, as specified, the gate constructed on the principle and applied to a post B, substantially as described.

63,933.—W. W. PALMER, Hudson, Mich.—*Hame Fastener.*—April 16, 1867.—The bars have hoops to engage the hame loops. One bar has shoulders to

catch the keepers attached to the other bar when pressed by the spring at its back.

Claim.—The metallic bar B, with its keepers C C, and curved spring D, when used in combination with the bar A, in the manner and for the purpose specified.

63,934.—CHAUNCEY C. PARKER, Brooklyn, N. Y.—*Curtain Fixture.*—April 16, 1867.—The cord is fastened to the pulley whose arm enters the coils of a helical spring in the slotted case.

Claim.—The pulley slide formed with two arms at right angles to each other, one arm *e* receiving the pulley, and the other arm *f* extending within the coils of a helical spring *c* within the slotted case *a*, so that said arm *f* becomes a guide to sustain the pulley but allow its free motion, as set forth.

63,935.—JAMES A. PARTRIDGE, Lowell, Mass., assignor to himself and E. D. WRIGHT, same place.—*Wrench.*—April 16, 1867.—The half nut with which the adjusting screw engages is on a spring lever and may be raised from the screw to allow rapid adjustment of the jaw. The jaw and lever are shouldered to give firm bearing in use.

Claim.—First, the liberating lever A, applied to the movable jaw of a slide wrench, when said lever has a segmental nut formed in the end *b* thereof, to engage with the screw G and a spring *g* at or near the end *d*, to throw the nut into contact with the screw, and all arranged to operate substantially as and for the purpose set forth.

Second, the shoulders *e¹ e²*, constructed and arranged to operate substantially as and for the purpose set forth.

63,936.—S. H. PERKINS and THOMAS S. GILBERT, New Haven, Conn.—*Machine for Making Hoop Skirts.*—April 16, 1867.—The cylinder has a circumference equal to the largest hoop, and its grooves receive the covered wire. A clamp holds the wires to the adjustable gauge on the face of the cylinder, above which is the inking roll. A cutter across the periphery of the cylinder, corresponding with a cutter on a shaft above, severs the wire at the required length.

Claim.—Automatically measuring, marking, and cutting wire for skirt hoops, substantially as herein set forth.

63,937.—ALONZO PERRY and MOSES C. HAWKINS, Edenboro, Pa.—*Pump.*—April 16, 1867.—The wings of the piston oscillate in sectional chambers of the cylinder, and have valves opening in one direction. The cylinder and air drum have inward-opening valves for the passage of water.

Claim.—The construction and arrangement of the double-armed reciprocating piston C, having valves F, its hub E, working air-tight between the angles of the perforated partition plates J, thereby forming the chambers F² in the cylinder A, valves I in the chambers G H, discharge ports M in the sections of the chamber F, uniting and forming the tube N upon the upper half of the cylinder A, as herein shown and described.

63,938.—L. POLLOCK, Fishkill Landing, N. Y.—*Sash and Blind Fastener.*—April 16, 1867.—The thread of the bolt passes through the sashes at their lap and screws into the shutter. A sliding catch on the inside engages a square on the shank to keep it from being unscrewed.

Claim.—The combination of the screw bolt E, provided with the square part *e²*, and the sliding bolt H, constructed and operating substantially as described and for the purpose set forth.

63,939.—ELISHA O. POTTER, North Providence, R. I.—*Apparatus for Guiding Cloth.*—April 16, 1867.—The cloth roller has end movement by a rack on its journal box, being scored to receive a projecting rib of the said box. The rack is engaged by a spur wheel upon a shaft, receiving motion by one of two pawls on an oscillating frame. The frame is adjusted by the selvage of the cloth through a bell-crank lever with which it comes in contact to throw the proper pawl in gear to move the cloth roller, to correct any deviation from a straight line in the travel of the cloth.

Claim.—First, in an apparatus for guiding cloth,

the combination of the rack and pinion mechanism for moving the cloth roller, and the pawl and ratchet mechanism for adjusting the frame, and the bell-crank lever for throwing the pawl in gear, and the frame for adjusting the pawl, and the selvage of the cloth through a bell-crank lever with which it comes in contact to throw the proper pawl in gear to move the cloth roller, to correct any deviation from a straight line in the travel of the cloth, substantially as described.

paper, or other like material, during its delivery to other machinery, the combination of a beam capable of an endwise movement with the selvage edge of the material as it is being unrolled, in the manner substantially as described, for the purposes specified.

Second, the combination, in an apparatus for the above-declared purpose, of the following instrumentalities: A beam capable of an endwise movement, a rack pinion *d c*, and a double pawl and ratchet gear *E' g g*, or the equivalents thereof, substantially as described.

Third, the combination, in an apparatus for the above-declared purpose, of the following instrumentalities: A mechanism for imparting an endwise movement to the cloth beam, as above described, a disk plate *H*, and vibrating bent lever *I*, or the equivalents, for putting into action or suspending the operation of the mechanism of the shifting the position of the beam, substantially as described.

63,940.—NARCISSE REEVES, Du Quoin, Ill.—*Car Coupling*.—April 16, 1867.—The link is attached to a sliding block in one draw-head whose rear end passes through a weighted arm. The coupling pin traverses both link and block. The other draw-head has a sliding block pressed forward by a weighted lever and having a forward projection to support the coupling pin until the block is driven back by the entering link.

Claim.—The combination of the sliding block *H* and weighted arm *J* with the link *D* and bumper *G*, substantially as herein shown and described and for the purpose set forth.

63,941.—ALMON C. ROBINSON, Louisiana, Mo.—*Corn-husking Shield*.—April 16, 1867.—The metallic guard is shaped to fit either thumb, round which it is sprung to keep it in position. A projecting claw tears the husk.

Claim.—A corn-husking metal shield to wear upon the thumb of either hand, constructed and operating substantially as herein shown and described.

63,942.—ROBERT ROBINSON, Brooklyn, N. Y.—*Bottle Stopper*.—April 16, 1867.—The stopper, with a band around the waist, is pushed into the neck, and the expansion of the contents of the bottle forces the bulb of the stopper against the band, and closes the exit.

Claim.—Closing the neck of the bottle by means of the stopper *A*, constructed as described, having its ends *a¹ a²* of greater diameter than its center, and by placing the elastic band *B* over the upper end *a¹*, and after being inserted in the neck of the bottle, pressing said elastic band down upon the part *a²*, of increasing diameter, as herein shown and described.

63,943.—JOHN ROEBUCK, New York, N. Y.—*Match Safe*.—April 16, 1867.—The bottom, back, and lid are stamped with a grooved connection depending with the use of wire, the lid falling freely. Above is a receptacle for waste matches.

Claim.—The match safe *A*, consisting of the bottom piece *b*, back piece *c*, sides *a a*, falling lid *d* hinged in the groove *f*, and waste match receiver *e*, constructed and arranged as herein shown and described.

63,944.—CLEMENS B. ROSE, Sunderland, Mass.—*Bit Stock*.—April 16, 1867.—The sliding jaws embrace the bit shank as they are forced together by the engagement of the screw collar with their outer edges. The shaft and the inside of the tubular part of the head are grooved to form a chamber for a ring of Babbitt metal which is cast within.

Claim.—First, the bit stock provided with the socket *D*, the sliding jaws *b*, having the inclined heads *d*, and projecting or raised screw threads *e* and ring *B*, all constructed and arranged to operate as herein shown and described.

Second, connecting the head *K* to the shaft by means of the grooves *i i* and *L* and the collar *O*, melted in around them, substantially as set forth.

63,945.—JOHN J. SANDGREN, Lyons, Iowa.—*Lever Shears*.—April 16, 1867.—The lever is connected by a series of links and an intervening lever to the movable jaw of the shear, and by a wide sweep operates the same through a short stroke with cumulative force.

Claim.—The peculiar arrangement and combination of the levers *E* and *F* with the cam *J* and straps *K G* and *H*, all for the purposes set forth.

63,946.—H. W. SANFORD, Thomaston, Conn., assignor to himself and HORACE SMITH.—*Skate*.—April 16, 1867.—The nose of the runner has a sector bevel gear, which connects a shaft and pinion with racks on the jaws to clamp the shoe sole, as the runner is brought from a dependent to an effective position, where it is secured by a spring catch in the heel post.

Claim.—The vibratory or lever runner *B*, in combination with the sliding clamping jaws *t t'* and *w w'* and the skate stock, the whole constructed in the manner and operating as hereinbefore described, for the purpose set forth.

63,947.—AMOS W. and JAMES SANGSTER, Buffalo, N. Y.—*Beer Cooler*.—April 16, 1867.—The beer passes over a series of conical vessels through which the cooling liquid flows. The vessels have interior disks for the better distribution of the liquid.

Claim.—First, the cone-shaped coolers connected together as described; also in connection therewith of one or more partitions as shown at *G*, or the equivalents thereof, for the purposes described and set forth.

Second, in combination with the cone or cones we claim the tubes *D D³ D¹* and *D²*, substantially as herein described.

Third, the employment of a corrugated surface on the upper part of the cone as shown in Fig. 3, for the purpose of more equally distributing the liquid to the cooler as it flows over said surface.

Fourth, the plate *E*, as and for the purposes described.

63,948.—CHAS. H. SAWYER, Hollis, Me.—*Bench Plane*.—April 16, 1867.—The face is pivoted to the ends of the stock and is expanded or contracted by a vertical screw operated by a crank above.

Claim.—The arrangement of the screw *B* in combination with the joints or pivots by which the sheet *m* is connected at its ends to the ends of the handle or stock *A*, as and for the purposes herein described.

63,949.—AUGUSTUS SCHELLER, New York, N. Y.—*Process of Whitening Horn*.—April 16, 1867.—The horn is immersed in a solution of 1 lb. crystallized white acetate of lead and 3 lbs. water, kept at a moderate heat until the surface of the horn is uniformly black. It is then cleaned in water, and immersed in dilute muriatic acid until white, then repeatedly rinsed in cold water and allowed to dry in a warm room.

Claim.—The within described process of whitening horn or other similar substances by treating with acetate of lead or any other soluble salt or oxide of lead and with muriatic acid, substantially in the manner set forth.

63,950.—FRED'K J. SEYMOUR, Wolcottville, Conn.—*Twine Holder*.—April 16, 1867.—The twine passes through slots by friction bars, which prevent the premature or unnecessary unwinding of the ball.

Claim.—A twine holder formed of a metallic case fitted so as to be suspended, and provided with a brake to prevent the cord or twine running out by its own weight as specified.

63,951.—JOHN SHINN, Philadelphia, Pa., assignor to himself and GEORGE S. RHODES.—*Press Boards for Oil Presses*.—April 16, 1867.—The boards have grooved faces, which in use are covered with wire gauze.

Claim.—A press board or plate formed with grooves running parallel or otherwise, in combination with a wire screen as described, for the purpose set forth.

63,952.—HENRY B. SMAWLEY, Greensburg, Ind.—*Draining and Ditching Plow*.—April 16, 1867.—The cutters of the mold-boards are placed at right angles to conform to the shape of the drain. The soil slides up an incline and is guided laterally by plates and discharged over the side of the plow.

Claim.—The arrangement of the share *B* provided with two connected but distinct points, one in advance of the other, with the cutters *C D*, as constructed and connected to the beam, and the inclined

plane K provided with a back bone or brace on its under side, the several parts being used together, substantially as and for the purpose specified.

63,953.—GASTON D. SMITH, Washington, D. C.—*Coal Scuttle*.—April 16, 1867.—The radially perforated false bottom is worked by a handle behind to screen out ashes. The ash box fastens to the bottom by a bayonet catch.

Claim.—The perforated malleable cast-iron bottom plates *a* and collar *x* of a cold hod provided with an ash box B attached to it by a bayonet joint, when the same is constructed and arranged as and for the purpose set forth.

63,954.—GEO. SMITH, Providence, R. I.—*Draft Plate*.—April 16, 1867.—The rectangular plate has upwardly projecting lugs entering mortises in the under side of the thill and is retained by the belly band which is attached to the plate and passes over the thill; the tug engages the sliding spring plate.

Claim.—First, the construction of the open or skeleton plate A with a horizontal thill supporting shelf B formed on its lower edge, and two or more tenons or lugs *a* for receiving openings in the bottom of a thill, substantially as described.

Second, the longitudinally sliding head D, fixed guide rod *f*, and central spring *g*, applied to the right angular draft plate A B, substantially as described.

Third, the two slots *d'* and *e'* when arranged on each side of the sliding head D of the draft plate A B, as described and for the purposes set forth.

Fourth, the combination of the slotted bars *d* and *e*, upright bars *c* and *c'*, and shaft B, constructed of one piece of metal and adapted to serve the improved purposes described.

63,955.—HIRAM MOORE SMITH, Richmond, Va.—*Hoisting Machine*.—April 16, 1867.—The drum has two spur wheels varying in size, which are optionally engaged with one of two similar wheels, on a sleeve on the operating shaft, a spline admitting longitudinal movement to bring either of the wheels in operation. This movement of the sleeve is caused by a rope which passes down to the operator from a weighted pulley whose shaft has a crank connected to said sleeve.

Claim.—When applied to a hoisting machine, the double wheel on the cylinder A, the two pinions combined and working on the rope wheel shaft the crank and loaded wheel for moving and holding them securely in gear, the whole constructed and operating as above described and set forth.

63,956.—SIDNEY SMITH, Worcester, Mass.—*Fire Chamber for Furnaces*.—April 16, 1867.—Improvement on his patent of July 31, 1866. The fire pot is formed of perforated staves rabbeted together and surrounded by perforated casings. These casings are held by ridges on the top and bottom plates, which have holding rods and are separate from the outer case of the stove and rest on rollers. The front plate of the stove is removable to allow the fire chamber to be drawn out. The fire pot bottom is a hinged trap supported by a bent arm on a rock shaft furnished with a winch, ratchet wheel, and pawl to operate or retain it.

Claim.—The cast iron perforated, flanged, and rabbeted staves B, for the purpose of forming a fire chamber, substantially in the manner set forth.

A fire-chamber constructed substantially in the manner described, so as to be removable entire from the frame or casing supporting it, for the purpose set forth.

In combination with the trap G, the arm H, and ratchet shaft I, substantially as and for the purposes set forth.

In combination with the fire chamber claimed in the second claim, the rollers K, substantially as and for the purposes described.

In combination with the fire chamber claimed in the second claim the removable front J, substantially as and for the purpose set forth.

63,957.—GEORGE L. SQUIER, Buffalo, N. Y.—*Evaporator for Saccharine Juices*.—April 16, 1867.—Air from a pipe traversing the furnace is discharged beneath a horizontal plate within the pan. The rear

end of the furnace is divided longitudinally and each division has a damper.

Claim.—First, in a series of two or more evaporating pans, arranged and used for evaporating saccharine juices, making the bottoms of such pans of different thicknesses of metal, for the purposes and substantially as specified.

Second, in a series of two or more evaporating pans, arranged and used for evaporating saccharine juices, making such pans of different depths, for the purpose and substantially as set forth.

Third, an air pipe or pipes or conductors so connected and arranged with an evaporating pan or pans for treating saccharine juices that currents of hot or cold air (either or both) may be forced through or into the juices during either part of the process, for the purpose and substantially as set forth.

Fourth, regulating and controlling the temperature of saccharine juices by means of hot or cold air forced therein in the process of evaporation, substantially as set forth.

Fifth, placing or arranging an air pipe within the furnace, so that the same fire used for heating the evaporating pans may also be used for heating the air.

Sixth, the plate K, placed in the evaporating pan for the purpose of spreading the air and for drawing the steam to the center, substantially as described.

Seventh, dividing the furnace in the rear into two flues, with a damper at each flue, in connection with evaporating pans, constructed and arranged as herein described.

63,958.—EDGAR M. STEVENS, Chelsea, Mass., assignor by mesne assignments to A. B. ELY, Newton, Mass.—*Rubber Heel Stiffener*.—April 16, 1867.—The rubber stiffener has slits in its rear to enable it to assume the shape of the heel.

Claim.—A molded heel stiffening of rubber or similar elastic material, having a slit or slits cut in the rear portion of the lower and under rim, as and for the purposes set forth.

63,959.—W. X. STEVENS, Worcester, Mass., and W. E. PUFFER, Lexington, Mass.—*Damper for Stove Pipes*.—April 16, 1867.—The doubly-curved plate attached to the bar moves longitudinally, in connection with the semicircular frames, and regulates the draft aperture.

Claim.—First, keeping two or more parts of a stovepipe damper in the desired relation to each other by means of the turning bar used as a pin, in the manner and for the purposes set forth.

Second, the combination and arrangement of frame A, gate B, and bar C, as specified, and for the purposes set forth.

63,960.—WILLIAM T. SWEET, Fayette, N. Y.—*Device for Washing Carriage Wheels*.—April 16, 1867.—The wheels are received into the semi-cylindrical tub, the axes rest in bearings, and the wheels rotate against mops or brushes arranged inside the tub.

Claim.—A receptacle A, provided with sockets *c* and brushes *i*, operating substantially as and for the purpose herein set forth.

Also, the folds *g* *g*, or equivalent, in combination with the receptacle A, operating substantially as and for the purpose specified.

63,961.—JESSE TRED, Tompkins, N. Y.—*Animal Trap*.—April 16, 1867.—The spring and jaws are made of one strip of steel, and the brace, which keeps them apart, has the bait attached; a trigger releases the jaws, which grasp the animal that is pulling upon the bait.

Claim.—The combination of the spring trap A, (composed of one piece,) and having two supporting legs B B and the detachable brace or triggers C, arranged and operating in the manner shown and described, and for the purpose set forth.

63,962.—E. LAWRENCE TEVIS, Philadelphia, Pa.—*Hinge for Shutters*.—April 16, 1867.—The latch attached to one plate of the hinge engages a catch formed on the knuckle of the other plate, to hold the door in an open position.

Claim.—A self-catching hinge, provided with cam D, lug *o*, pin P, and catch *e*, the whole combined and

constructed in the manner and for the purpose above described and set forth.

63,963.—ALEXIS THIRULT, Williamsburgh, N. Y., assignor to himself and B. S. HILTON, New York, N. Y.—*Apparatus for Treating Petroleum.*—April 16, 1867; antedated April 5, 1867.—The condensing coil receives the oil from the still and passes it into one or more tanks; these are closed and have steam pipes extending down to different depths, so that by letting steam into the oil an agitation is produced to separate the light from the heavy parts.

Claim.—First, the arrangement of one or more steam jets *a*, in combination with the condensing coil *A*, constructed and operating substantially as and for the purpose set forth.

Second, the steam jets *d* or *d'*, applied in combination with tanks *C* or *C'*, and with the pipes carrying the oil into said tanks, substantially as and for the purpose described.

Third, the jets *d** or *d*** in combination with the tanks *C C'*, constructed and operating substantially as and for the purpose set forth.

Fourth, the combination of the coil *A*, tanks *C C'*, steam jets *a d d* d***, and coils *k i*, all constructed and operating substantially as and for the purpose described.

63,964.—ISAAC P. TICE, New York, N. Y.—*Spirit Meter.*—April 16, 1867; antedated April 5, 1867.—The spirit is tested by the registering hydrometer, the proof being recorded on the paper. It then flows into the measuring pans by the tilting hopper. These pans are so constructed that the valves close when the pans are exactly full, and they are then tilted by filling the space above the diaphragms. The floats operate the lever to release the hooks. The floats operate the induction valve so as to stop the flow of spirit to the meter in case the discharge pipe is closed.

Claim.—First, the diaphragm measuring can or cans constructed so as to form a chamber above and below, and provided with valves to admit and discharge the liquid into and from the lower chamber of each can by the movement or action of the latter, substantially as specified.

Second, in combination with the measuring or weighing cans, the valves controlling the entry and discharge of the liquid thereto or from, constructed so as to spring or yield on the cans reaching the end of their strokes to give time and space for the locking of the raised can, essentially as herein set forth.

Third, the combination of the diaphragm, measuring or weighing cans, tilting hopper *G*, and floats *K K'*, with locking and unlocking devices under control of the floats, substantially as specified.

Fourth, the combination with a liquid meter of a device for closing the induction or passage of liquid through the meter so operated or set in motion automatically by the liquid in the induction passage as to prevent tampering with the meter, essentially as herein set forth.

Fifth, the combination with a vessel within the meter of a detector, arranged within said vessel and operated by the liquid rising therein to record any attempt at tampering with the meter, substantially as specified.

Sixth, the combination, in a spirit meter, of a hydrometric and thermometric register with a counter or indicator of quantities for operation together by the weight or action of the liquid, or other motor, in passing through the meter, essentially as specified.

63,965.—THOMAS L. UPTON, Farmington, W. Va.—*Medical Vegetable Liniment.*—April 16, 1867.—Composed of linseed oil, 1 qt.; oil of spike, 1 qt.; spirits of turpentine, 1 qt., alcohol, 1 qt.; gum myrrh, $\frac{1}{2}$ lb.; gum camphor, 1 oz.; capsicum, 1 oz.

Claim.—The liniment, consisting of the ingredients named in about the proportions specified, and compounded substantially as and for the purpose set forth.

63,966.—THOMAS L. UPTON, Farmington, W. Va.—*Medical Vegetable Salve.*—April 16, 1867.—Composed of the root of scrophularia marylandica, 2 lbs.; top of erigeron philadelphicus, 2 lbs.; bark of ulmus fulva, 2 lbs.; of rosina alba, 3 lbs.; gum camphor, $\frac{1}{2}$ lb.; pinus balsamea, 1 qt.; castile soap, 1 lb.; com-

mon rosin, 2 lbs.; beeswax, 3 lbs; mutton tallow, 5 lbs.

Claim.—The salve, consisting of the ingredients named in about the proportions specified, and compounded substantially as and for the purpose set forth.

63,967.—PETER VON LACKUM, St. Charles, Minn.—*Device for Sacking Grain.*—April 16, 1867.—The grain is raised by an endless apron and buckets, and is discharged through an adjustable tube, to which bag hooks are attached.

Claim.—First, the elevator *A B E*, provided with the adjustable tube *a*, having hooks for attaching the bag or sack, arranged to operate substantially as shown and described.

Second, the combination of the adjustable tube *a*, cords *b*, lever *d* and ratchet *f*, when arranged for joint operation, as set forth.

63,968.—PETER VOORHIS, New York, N. Y.—*Obstructing Ice in Rivers and Harbors.*—April 16, 1867.—The iron-clad obstructors are made of cross timbers, and are anchored as a guard from floating ice for harbors, ferries, &c.

Claim.—The combination of floating iron-clad obstructors with anchors, arranged to operate substantially in the manner and for the purposes herein before described.

63,969.—THOMAS A. WARREN, Gettysburg, Pa.—*Churn.*—April 16, 1867.—The dashers of the axial and sleeve shafts respectively have a reverse motion in a horizontal fluid box, and are steadied by a balance wheel.

Claim.—The arrangement of the horizontal churn box, provided with a curved corrugated or irregular bottom, with the shaft *C* and frame *D*, provided with arms *d*, revolving in different directions, and with the wheel *K*, the whole being constructed and used in the manner and for the purpose specified.

63,970.—GARDNER WATELS, Cincinnati, Ohio.—*Apparatus for Purifying Mash for the Manufacture of Vinegar.*—April 16, 1867.—The mash is passed through the vertical column, containing perforated plates. A current of steam enters below. A pipe connects the column with a condenser.

Claim.—The apparatus made and operating substantially as set forth.

63,971.—PHILIP WECK, Brooklyn, N. Y.—*Seaming Tool.*—April 16, 1867.—The frame which fits and revolves around the top of the can has adjustable grooved rollers, which compress the cover round the rim of the car.

Claim.—A tool consisting of a frame *B*, provided with a series of rollers, whether more or less in number, when one or more of such rollers are arranged, so as to be slid or moved in or out upon the said frame, substantially as and for the purpose described.

63,972.—MILO D. WILDER, Laporte, Ind.—*Cattle Pump.*—April 16, 1867.—The hub of the operative parts forms a sleeve upon the upper portion of the pump barrel. The lever by which the gearing and pump are operated is a pipe, which leads the water to the trough at the end of the lever, which is rotated by animal power.

Claim.—The tubular driving lever *C*, in combination with a pump and a trough, which pump is operated by gearing, substantially in the manner herein shown and described.

63,973.—E. S. WILKINS and JOHN STRAW, Stowe, Vt.—*Mop Squeezer.*—April 16, 1867; antedated March 14, 1867.—The frame is clamped to the pail by an adjustable hoop. The side boards in conjunction with press boards are operated by the treadle to squeeze the mop. A tapering lever, having a coiled wire spring, presses against the roller, and throws open the press boards.

Claim.—The treadle *R*, mop squeezer *G* and *H*, and spring lever *M* and pail *B*, when arranged, combined, and operated as herein described and for the purposes set forth.

63,974.—HORACE S. WOLF, Rolling Prairie, Ind.—*Gate.*—April 16, 1867.—The lever is pivoted on top

of the back post with a fulcrum near the middle, and is adjusted by an upright lever in front, held in position by a swing pin entering notches in the frame.

Claim.—The application of the lever herein described, by means of which to elevate the entire gate, and that too with the least possible labor.

63,975.—GEO. W. WOOD, Richmond, Ind.—*Inking Apparatus.*—April 16, 1867.—The fountains having various colored ink are supported on bent arms and ink is taken from their rollers by "composition" rollers on vibrating arms similarly bent. These latter rollers carry the ink to belts which pass around adjustable rollers and under distributing rollers to a common roller, beneath which they communicate ink to the type rollers. The whole system of rollers and belts is actuated by a rack on the reciprocating bed. The journals at one end of the distributing rollers are alternately right and left screw threaded, so that the reciprocation of the bed causes a like end motion to said rollers.

Claim.—First, the use in an inking apparatus of one or more inking belts for conveying the ink whether applied automatically from a fountain or by hand.

Second, the combination of a fountain from which the ink is transferred to the inking belts and the distributing rollers.

Third, the combination of one or more inking belts, and the composition rollers from which the ink is transferred to the type.

Fourth, the combination of the driving roller I, the inking belts and distributing rollers turning upon their axis, and having a longitudinal reciprocating motion.

Fifth, the arrangement of the distributing rollers and inking belts, so that the former shall have a revolution upon their axes, and at the same time an alternately reciprocating motion in opposite directions longitudinally in contact with the face of the belt.

Sixth, the combination of the adjustable fountains, the soft rollers attached to an oscillating frame, and adjustable rollers around which the inking belts are carried.

63,976.—JOHN WOOD, Brooklyn, N. Y.—*Steam Engine Governor.*—April 16, 1867.—Water is forced beneath a piston which is depressed by a spring; the piston rod is connected to a lever which operates the governor valve. The receiving pipe and discharge pipe of the cylinder enter the same tank and the outflow is regulated by a valve. Increased speed of the engine raises the piston and partially closes the governor valve. A further acceleration in speed opens the valve of an additional discharge pipe to relieve the pressure and prevent fracture of the parts.

Claim.—The piston *i*, spring *n*, and connections *k l* to the throttle valve, in combination with the pump *a* and valve *q*, operated by a connection *s*, to the piston *i*, as and for the purposes specified.

63,977.—SYLVESTER C. WRIGHT, Fitchburg, Mass.—*Friction Clutch.*—The smaller gear and conical clutch plate are connected to the tubular shaft, upon which the larger gear revolves loosely until by the revolution of the nut the clutch plate is drawn into the recessed face of the larger gear wheel and clutched thereto. The auxiliary nut screws on the axial shaft and the main nut upon the sleeve, the two being co-active.

Claim.—For effecting the movements of the clutch plate *D*, the combination of the auxiliary male screw *h*, and its bar or nut *E* with the nut *G*, and its male screw *f*, having their threads pitched in opposite directions to those of the screw *h*, and nut *E*, the whole being applied substantially as explained to the parts or shaft *C* and *H*, projecting from the gears *A B*, and the clutch *D*, as set forth.

Also, the arrangement of the auxiliary nut *E*, and its screw *h*, at either end of the shaft *H*, as hereinbefore set forth, when combined with plate *D*, tube *c*, and nut *G*.

Also, the combination as well as the arrangement of the oil passages *k l*, with the bearing *F*, the shaft *C*, and the clutch plate *D*, applied to the shaft by means substantially as specified.

63,978.—C. E. BILLINGS, Hartford, Conn.—*Die for Forming Shuttle Frames.*—April 16, 1867.—The cavity in the lower die forms the outside of the frame

and the projection on the upper die forms the top and cavity of the frame as the die drops or is pressed upon the bar of heated metal. A second set of dies without a cavity for the neck smooths the cold blank and finishes the shuttle frame.

Claim.—First, the dies *C* and *D*, with cavity *a* and projection *b*, for the purpose of forming the shuttle frame, arranged substantially in the manner described.

Second, the dies *E* and *F*, the cavity *c*, and projection *d*, for the purpose of finishing the shuttle frame, arranged substantially in the manner described.

63,979.—PHILLIP HINKLE, San Francisco, Cal., assignor to himself and CHARLES S. CAPP, same place.—*Machine for Grinding and Amalgamating Ores.*—April 16, 1867.—The pan has vertical, interior walls made up of renewable sections against which operate the millers which are pivoted to vertical posts on the rotary disk, and when revolved are driven by centrifugal force against the walls of the pan. The pulp escaping upwardly is conducted again by the dish-shaped cover to the center, to be again subjected to trituration, passing on its way the current-breaking ring and annular groove containing mercury.

Claim.—First, the employment of the renewable side dies *G G*, to form a perpendicular grinding surface on the sides of the tub or pan, substantially in the manner and for the purpose described.

Second, the employment of the perpendicular muller hangers *E E*, loosely hung on the pins *C C*, carrying the renewable mullers or grinding plates *F F*, of the shape shown in the drawings, thrown and passed laterally by centrifugal force against the perpendicular grinding surface *G G*, when the arms *B B* are revolved, with the supporting lip *I*, and bearing surface *D*, upon the arms *B B*, by which arrangement the pressure is lightest at the feeding point and heaviest at the heel of the muller, and also the provision for loading the muller hanger to counterbalance the loss of weight by wear of the face of the muller, *F*, substantially in the manner and for the purpose described.

Third, the shape and arrangement of the cover of the pan *U*, so as to form a flattened funnel-shaped dish, with annular grooves *S*, for mercury, and raised current-breaking ring *W*, on its upper surface, the collars or projecting flange *V* with the apertures *R R*, under it, by which the escape of the pulp is permitted, and its current directed so that it is returned to the center, and a continual circulation maintained.

63,980.—WM. H. ANDREWS, New Haven, Conn.—*Attaching Knobs to Door Latches.*—April 23, 1867.—The rose is retracted to the knob, and when the screw is inserted into the sleeve and spindle, is slipped back, covering the screw, and is secured to the door.

Claim.—First, the combination of the plate *b* with the spindle *C* and knob *B*, constructed and arranged in the manner and for the purpose substantially as set forth.

Second, the rose *E*, constructed in the manner described, in combination with the plate *b*, and the knob and spindle arranged so as to insert and cover the screw or pin *a*, substantially as and for the purpose set forth.

63,981.—GIDEON AUGHINBAUGH, Portland, Oregon.—*Gold Separator.*—April 23, 1867; antedated April 19, 1867.—The shaker is supported upon bars in the frame, is operated by cams, and contains a series of sieves provided with ripples; to the upper one is attached a hopper.

Claim.—The principle of constructing series of sieves provided with bars or ripples and placing the sieves in an inclined shaker for the purpose of separating gold from earth, and the principle of operating said shaker upon pivots, and the direct application of eccentrics to the shaker.

63,982.—JOHN A. BACHMAN, Lambertville, N. J.—*Machine for Grinding the Surface of Marble or Stone.*—April 23, 1867.—The tray has vertical slots to allow the passage of water and sand, and a socket to receive a spindle to which the handle is attached, and supports the water vessel.

Claim.—A metal plate with rim and openings, combined with a water vessel and handle, in the manner and for the purpose substantially as herein described and set forth.

63,983.—HIRAM BARKER, Aurora, Ind.—*Broom Head.*—April 23, 1867.—One end of each binding wire is attached to the cylinder and the other passes through slots in the sleeve to the handle within. On turning the latter the wires tighten on the corn, and the position is maintained by nails.

Claim.—The cylinder B and binding wires or cords E, arranged substantially as described, in combination with the broom handle A and plug C, with their adjuncts, the holes *b* and *a*, substantially as and for the purpose set forth.

63,984.—E. M. BATES, East Rochester, Ohio, assignor to himself, J. H. and G. W. SANOR, Hanover, Ohio.—*Valve Gear.*—April 23, 1867.—The two ends of the valve rod, attached to the valve and eccentric respectively, are connected to a cross-head on the free end of an oscillating frame, which is adjusted by a screw in a direction perpendicular to the valve rod, thereby adjusting the cut-off.

Claim.—First, the screw F, shaft D, cross-head C, and stay J, as arranged in combination with the frame A, for the purpose and in the manner set forth.

Second, the frame K, cross-heads L and C, when arranged and operated conjointly by the eccentric rod O, valve rod M, and adjusting screw F, for the purpose and in the manner as substantially described.

63,985.—L. M. BATES, Newark, Ohio.—*Spring for Bed Bottoms and other Purposes.*—April 23, 1867.—The upper head of the rubber spring is suspended from strips attached to the frame; the slats are suspended from the lower head.

Claim.—The tensile spring A, composed of elastic gum and furnished with two heads, as and for the purpose described.

63,986.—GEO. H. BECHTEL, Philadelphia, Pa.—*Ice Pitcher.*—April 23, 1867.—The inner shell is made in one piece to avoid the danger from opening joints, and the upper part of the pitcher enlarges for greater ease and safety in filling.

Claim.—In double or ice pitcher, the making of the inner shell or jacket in one piece, and without a joint, so as to prevent its liability to leak, substantially as described.

Also, in combination with double-jacketed or ice pitcher, the making of the inner area thereof greater above its central portion than below that point, when this is attained by curved or arched top, bottom, and sides, and without angular joints, as and for the purpose described.

63,987.—THOMAS H. BERRY, Lynn, Mass.—*Preparing Coffee for Transportation.*—April 23, 1867.—A solution of French isinglass, 1 oz., and water, 4 oz. to each pound of coffee is used. The mass is thoroughly mixed and molded to form.

Claim.—The above-described composition of matter, substantially as and for the purpose set forth.

63,988.—ALBERT BINGHAM, Newtonville, Mass.—*Window Latch.*—April 23, 1867.—The beveled catch on the upper sash projects through a slotted plate on the lower sash, and is secured by the spring lever attached to the latter.

Claim.—The combination of the lever D, the slotted plate C, the springs S, and beveled catch E, the whole forming an automatic window latch, applied and operating as above set forth.

63,989.—A. H. BRAINERD, Rome, N. Y.—*Churn.*—April 23, 1867.—The dashers consist of perforated hinged plates which are journaled in the sides of the tub, and also to a central vertically moving portion which is reciprocated in guides. Slides cover the opening through which the dasher rods pass.

Claim.—First, the hinged dasher or dashers L, M, connected to the gate K and to the side of the churn respectively, and operating as described.

Second, the arrangement of the series of compartments A B C and the hinged dashers, operating simultaneously by the three-throw crank, substantially as described.

Third, the hollow and slotted slide covering the orifice through which the churn dasher reciprocates.

63,990.—RUFUS BRUNSON, Chicago, Ill.—*Brick Press.*—April 23, 1867.—The follower is operated by

the motion of the lever, which has a segmental volute rack, engaging racks on two of the toggle plates and connected to the central pivot of the opposite plates through a slot in the former.

Claim.—The construction and combination of the side plates B, jointed plates C, with the rack V, and follower G, as operated by the lever T, ratchet S, and rod R, and forming a diamond-shaped press, as herein described and for the purposes set forth.

63,991.—JAMES B. CARY, Millersburg, Iowa, assignor to CARY and YOUNG.—*Tinners' Fire Pot.*—April 23, 1867.—The perforated tubes are connected to a plate secured by staples and pins in the side opening of the fire pot.

Claim.—The soldering iron tubes *ff* as secured to case *a* with catch *o*, as set forth in the specifications.

63,992.—JOHN C. CHAPMAN, Cambridgeport, Mass.—*Boring Tool.*—April 23, 1867.—The tapering plug has sliding cutters fed forward on an inclined plane by a suitable feed motion to bore a tapering hole.

Claim.—The combination of the tapering plug A, arbor B, and sliding cutter or cutters *a*, with the nut D, all arranged and operating substantially as herein set forth.

63,993.—HEZEKIAH M. CLARK, West Meriden, Conn., assignor to himself and E. A. KELSEY, same place.—*Bed Bottom.*—April 23, 1867.—The transverse slats rest on half elliptic slotted springs attached to the side bars.

Claim.—The combination of the frame E, half elliptic slotted springs B, attached to ends of transverse slats A, as and for the purpose specified.

63,994.—CARLETON CLIFFORD, Adams, N. Y., assignor to himself, A. W. LAKE, and T. P. SAUNDERS, same place.—*Brewing Ale.*—April 23, 1867.—The ale after coming from the coolers is put into casks with discharge tubes at top which empty into troughs, the ale settling in which passes back through return pipes. Water is supplied below the troughs to regulate the temperature, and passing down pipes flows through central chambers in the barrels and escapes by the waste pipe at the end.

Claim.—First, the close cask or tank A provided with the discharge tube C, or its equivalent, and employed to contain ale or other liquor while undergoing fermentation, substantially as and for the purpose specified.

Second, the combination with the above of the elevated receiving trough or box B, and return tube D, arranged substantially as and for the purpose specified.

Third, the water chamber *c* in combination with the receiving trough B, substantially as described.

Fourth, the combination of the cask A, tubes C D, trough B, box B', pipe or tube E, and water cylinder F, all arranged substantially as and for the purpose specified.

63,995.—LUCIAN B. CRAM, Weathersfield, Vt.—*Liniment.*—April 23, 1867.—Composed of oil origanum, spirits of ammonia, and spirits of turpentine, each 1 part, alcohol 3 parts.

Claim.—The combination of the four above named simple ingredients in the proportions of each, or substantially in the proportions of each above stated, for the uses and purposes above mentioned, as a new and valuable preparation for the treatment and cure of diseases and injuries, as above set forth.

63,996.—ROBERT CREUZBAUR, New York, N. Y.—*Connecting Links and Hooks.*—April 23, 1867.—The pivoted hook plates have concentric and counterpart tongues and grooves which engage and prevent spreading of the same.

Claim.—First, providing links and hooks with strengthening shoulders, substantially as described.

Second, providing for locking as well as strengthening connecting links, substantially as described.

63,997.—JOHN A. DANN, New Haven, Conn., assignor to himself and WILLIAM F. DANN, same place.—*Wood Bending Machine.*—April 23, 1867.—The metal straps are bent with the stuff to prevent

splintering, and are removed with the "former" and stuff to preserve the latter in form until seasoned.

Claim.—First, the arrangement of one or more cranks *D* in combination with their respective hooks *T* and links *f*, operating in connection with a former *I*, so as to force the wood down upon the former, substantially in the manner herein set forth.

Second, a mechanism substantially as described, which operating in combination with a former, forces the wood down upon and automatically secures it to the said former, substantially in the manner herein set forth.

Third, the adjustable cams or levers *S*, operating substantially in the manner and for the purpose set forth.

63,998.—JOHN DANNER and SAMUEL DANNER, Canton, Ohio.—*Bed Bottom.*—April 23, 1867.—The slats have metallic plates attached beneath near the ends, which slide in branching plates secured to transverse bars near each end of the bedstead. The slides admit flexion, and shoulders on the upper plates prevent displacement. Cords are stretched over the slats between the horns of the lower plates.

Claim.—In combination with the slats of a bed or lounge bottom and the bearers that support it, the casting *a b* made and operating substantially in the manner and for the purpose described.

63,999.—JOSEPH DAVIS, Jr., Templeton, Mass.—*Lamp.*—April 23, 1867; antedated October 23, 1866.—The upper lip of the conical, expansive, adjustable tube within the lamp is compressed to allow the insertion of the fibrous material through the annular space between it and the neck, and by a tapered plug is afterward expanded till it enters the recess in the cap, by which it is retained. There are vents for the fluid through the lower lip of the tube.

Claim.—The application of an expansive tube or case and a mass of cotton or fibrous stuffing to a lamp reservoir, substantially in manner as described, such tube in course of its application and after the insertion of the cotton or filling being expanded as explained.

Also, the lamp as constructed, with the tube-receiving recess, as explained.

Also, the improved lamp as constructed with the expandible tube and the receiving recess therefor, and as having a mass of cotton or fibrous material arranged in its reservoir and about such tube, as set forth.

64,000.—GEO. W. EARL and JAMES H. HAWLEY, Kalamazoo, Mich.—*Apparatus for Registering Games of Billiards.*—April 23, 1867.—The long actuating hand indicates the points made, and the other hands the number of games in regular progression, and in sets of twelve respectively. Each revolution of the actuating hand causes one blow upon the bell.

Claim.—First, combining the hand *A*, the arbor *B*, the cam *C* and the draft ratchet *D* with each other, and with the indicating face of the machine, in such a manner that while the points of a game from one to one hundred can be indicated by said hand, and a reversed movement be imparted thereto at any portion of its revolution short of an entire game, yet the moment that it passes said point a stop is interposed to prevent any backward movement of said hand, substantially as herein set forth.

Second, the combination of the hand *A*, the arbor *B*, the cam *C*, the draft ratchet *D*, the ratchet wheel *E*, the tubular arbor *i*, and the indicating hand *j*, with each other in such a manner that the said hand *j* will indicate upon the face of the machine the number of games and half games played from a half game to twelve games, substantially as herein set forth.

Third, the combination of the hand *A*, the arbor *B*, the cam *C*, the draft ratchet *D*, the ratchet wheel *E*, the tubular arbor *i*, the pinion *k*, the toothed wheel *l*, the pinion *m*, the toothed wheel *n*, and the tubular arbor *o*, with each other and with the hand *p*, in such a manner that the said hand *p* will indicate upon the face of the machine the number of games played from twelve to one hundred and forty-four, substantially as herein set forth.

64,001.—WM. H. ECKERT, Syracuse, N. Y.—*Plane Iron.*—April 23, 1867.—The cap has a short

slot wider than that of the cutting iron, and receives a nut into which the coupling screw is received.

Claim.—The nut *n*, in combination with the planing iron *A*, the screw *s*, and the cap *C*, made and operated substantially as and for the purposes described.

Also, the slot *h*, in the cap *C*, when made to fit upon the nut *n* and applied to planing irons, substantially as described.

64,002.—M. ELDRIDGE and F. A. REED, Alexandria, Va.—*Grain Elevator and Dumping Apparatus.*—April 23, 1867.—The elevating rope is attached to a bail whose ends engage two other bails, to whose ends the platform is hung. The corners of one side of the platform have sockets which traverse two vertical slide rods, having adjustable stops by which the platform is tilted.

Claim.—First, the platform *D*, in combination with the swivels *m*, which furnish pivots for the platform, whereby it assumes alternate inclined and horizontal positions, substantially as described.

Second, the guide bars *n*, in combination with the spring *o'* and stops *O*, as and for the purpose set forth.

Third, the hoisting and dumping apparatus constructed as explained.

64,003.—WM. H. ELLIOTT, New York, N. Y., assignor to JOHN KINGDON, Washington, D. C.—*Hay Loader.*—April 23, 1867.—The arm of the crane is swung round toward the hay and the fork inserted therein, swinging it from the ground; the spiral spring then acts on the pulleys to which it is attached, winds up the cord, and the pawl falling catches the pulley and retains the hay at the requisite height for pitching on to the load.

Claim.—First, the employment of an adjustable cord *l* between the arm of the crane and the fork *p*, substantially as herein shown.

Second, the employment of pulleys *f* and *i*, in combination with spring *k* and cord *l* for the purpose of taking up the latter after it has been drawn out, substantially as specified.

Third, connecting together pawl *h* and bolt *e* so that any motion given to the former will move the latter, substantially as and for the purpose specified.

Fourth, so combining pawl *h* and bolt *e* with cord *l* that the latter shall operate the two former, substantially as set forth.

Fifth, pivoting pawl *h* to movable arm *g*, so that these devices may have a little motion around the center of the pulleys, substantially as herein shown.

64,004.—GEORGE F. ELLS, Troy, N. Y.—*Hand Card.*—April 23, 1867.—Explained by the claim and illustration.

Claim.—A hand card having a wooden stock so formed with a rib or ribs *b* as to thereby cover or protect the edge or edges *e* of the leather or other sheet-like material *D*, which holds the teeth of the card, substantially as herein described.

64,005.—RICHARD H. EMERSON, Fond du Lac, Wis.—*Windlass.*—April 23, 1867.—The rope passes around the loose drum of the power shaft and the tight drum of the other shaft, being crossed between. The grooved guide pulleys are supported on a spring bar, and are depressed by levers to check the rope. The power is communicated through gear wheels of the two shafts.

Claim.—A windlass having shaft *a*, wheel *b*, drum pulley *c*, wheel *d*, drum pulley *f*, pulleys *g g'*, elastic *m'* spring bar *i*, levers *h h'*, arranged, combined, constructed and operating substantially as described.

64,006.—LUTHER H. FARNSWORTH, Hudson, Mass.—*Tool Handle.*—April 23, 1867.—The furcated pronged stock has a metallic collar fitting round the extremities of the prongs and against the shoulders thereof. The space between the prongs is filled with a heart piece of timber.

Claim.—The combination and arrangement of the metallic shouldered prongs and the head constituting the stock *A* with the metallic collar *C* and the heart piece *B*, the whole being made substantially as specified.

Also, the stock *A* made with the head, the series of prongs, and the shoulders thereof, as described.

64,007.—LORENZO FULTON, Edinburg, Ind.—*Low Water Indicator.*—April 23, 1867.—The lower end of a steam pipe opens into the boiler at the low water line, and this pipe at a distance from the boiler has an enveloping chamber containing liquid which will be evaporated by the admission of steam into the pipe, which steam passes through a pipe beneath the trigger valve and raising the same releases the safety valve and sounds an alarm.

Claim.—First, the arrangement of the pipe D, in connection with the chamber C, substantially as shown and described for the purpose of conveying a signal to a point at any desired distance, as set forth.

Second, the combination of the pipes B C and D with the disk E and trigger J, substantially as and for the purpose set forth.

Third, the equalizing pipe M, in combination with the boiler A and pipe B, substantially as and for the purposes described.

64,008.—FREDERICK BAUMGARTNER, Brooklyn, N. Y.—*Shifting Rail for Carriage Seats.*—April 23, 1867.—The shifting rail is attached to the stationary rail by hooks and clamps, so that when removed there may be no projections to tear the clothes, &c.

Claim.—Securing the shifting rail D to the stationary rail B of the carriage seat A by means of hooks F G and screw buttons or clamps H, substantially in the manner herein shown and described and for the purpose set forth.

64,009.—DEXTER GRAY, Upper Sandusky, Ohio.—*Sheep Rack and Shelter.*—April 23, 1867.—The grain boxes and feed troughs are mounted on runners, the frame rising to the required height to hold up the cross timbers that sustain the shelter roof. Portable hay racks are suspended from the frame. Transferable doors are suspended on pins for protection from storms.

Claim.—First, a portable stock shelter and feeding arrangement, combining the arrangement of runner's a, troughs K, grain boxes I, hay racks E, movable doors g, plates c and cross timbers d, substantially as described and for the purposes set forth.

Second, in combination with a portable stock shelter, the double troughs K K, with or without their separate chambers for each animal, in combination with a grain box, containing the bottom o, slide P, cut-off bottom r' and lever q, and partition m, all constructed and operated substantially as described and for the purposes set forth.

Third, in combination with a portable stock shelter, the movable and transferable doors g, for the purposes named.

Fourth, in combination with a portable stock shelter, the movable racks E, for the purpose set forth.

Fifth, in portable stock shelters the combination and arrangement of troughs K K K and their grain boxes I I I, with the racks E E, as and for the purposes set forth.

Sixth, in combination with a portable stock shelter, elevating the hay racks and center feed troughs, so as to secure all the ground room for the purposes set forth.

Seventh, a grain feeding box for stock, combining the sides, bottom o, slide P, cut-off bottom r, lever q and openings n, in each, for the purpose of feeding grain in measured quantities, as set forth.

64,010.—R. S. GRUMMON, Newark, N. J.—*Top Prop for Carriages.*—April 23, 1867.—The outer end of the socket forms a shoulder against which the joint bars are drawn by the head of the screw bolt. The thimble fits over the socket, and is pressed against the leather covering to exclude moisture.

Claim.—The solid-headed screw C, when used in combination with the socket B and thimble D, constructed and operated substantially as described for the purpose specified.

64,011.—THOMAS HAIGH, Liverpool, England, and ROBERT ADAM ROBERTSON, Philadelphia, Pa., assignors to E. F. PRENTISS, WM. D. PHILBRICK, and WILLIAM J. PARSONS.—*Apparatus for Boiling, Cooling, and Fermenting Malt Liqueurs.*—April 23, 1867; antedated April 9, 1867.—The mash tun is connected with the wort boiler and the water heating cistern. The wort is discharged downward into the hop back,

and from thence into the fermenting vessel, passing through the cooling pipes, which are slightly inclined from the vertical, and are surrounded by a current of water. The flow of water for cooling the wort is regulated by the expansion of air in the hollow floating head of the fermenting vessel.

Claim.—First, dividing the supply cistern into several compartments, and arranging a zigzag air passage above the water communicating with the ash pit of a steam boiler, or other furnace for generating a draft of air over the surface of the water in the supply cistern, substantially and in the manner hereinbefore described and set forth, or any mere modification of the same.

Second, the peculiar mode of constructing the double bottom of the wort-boiling pan, as hereinbefore described and set forth, or any mere modification of the same.

Third, forming the refrigerator columns with small chambers at the top and bottom of the small vertical pipes, as hereinbefore described and set forth, or any mere modification of the same.

Fourth, the peculiar form and arrangement of the floating cover for the fermenting tuns, as hereinbefore described and set forth, or any mere modification of the same.

Fifth, the peculiar construction and arrangement of the various parts of the self-acting temperature-regulating apparatus, and the mode of counteracting the fluctuations in the pressure of the external atmosphere, as hereinbefore described, or any mere modification of the same.

Sixth, and lastly, the general arrangement, combination, construction, and use of the apparatus hereinbefore described and set forth, or any mere modification of the same, for the purpose of boiling, cooling, and fermenting malt liquors, or other useful purposes.

64,012.—DAVID W. HENDRICKSON, New York, N. Y.—*Blast Furnace.*—April 23, 1867.—The annular boiler is placed on top of and forms part of the furnace. Tuyere pipes enter the steam space in the boiler, and blast pipes from the furnace pass through the water, and have exit into the flue. Other pipes, having stop cocks, throw upward jets of steam into the flue. The inner side of the boiler forms a frustum top to the furnace immediately beneath the flue.

Claim.—The arrangement of the boiler A, hot-air tubes d d and hot-blast pipes B¹ B² B³ B⁴ and stop cocks c c, all substantially as described and shown in the accompanying drawings.

64,013.—LUCIAN HILL, North Brookfield, Mass.—*Fan.*—April 23, 1867.—The circular fan is pivoted in the center between the branches of the handle, which is turned one quarter round when the fan is to be closed, its hinged creases permitting it to fold and an elastic loop holding it shut.

Claim.—First, a folding fan pivoted in the center and operating as described.

Second, the combination of the fan part A with the branches B B of the handle C, substantially as set forth.

Third, the combination with the fan part A and handle C of the loop or clasp D, substantially as and for the purposes set forth.

Fourth, making the handle C from two pieces B B, united at both ends as described, and cut or curved out to receive the fan part A, as shown and described.

64,014.—GARDINER L. HOLT, Springfield, Mass., assignor to himself and James M. THOMPSON, same place.—*Oiler.*—April 23, 1867.—A ballast ring is placed in the bottom of the oiler and wires are stretched diametrically across this ring to limit the play of the spring bottom.

Claim.—The combination of the ring B and one or more bars a b, arranged and constructed substantially as set forth.

64,015.—GEORGE HOUGHTON, Hudson, Mass.—*Shoe.*—April 23, 1867.—A metallic strip overlaps the seam and is secured to the leather on each side.

Claim.—The staying or fastening of sewed seams in the upper leathers of boots and shoes and other articles by means of a strip of thin metal extending on each side of the seam, whether the same is folded or extends over the edge and grasps both sides of the leather or other material or not.

64,016.—SILAS LAND, Philadelphia, Pa.—*Self-acting Eyelet Batten*.—April 23, 1867.—The battens have slotted eyelets for the screws whereby the boards of signs, &c., are attached.

Claim.—The combination of the slotted eyelets C with battens B, arranged and operating in relation to signs or other boards, substantially in the manner described and for the purposes specified.

64,017.—JOSEPH MANLEY, Hopc, Me.—*Stanchion for Cattle*.—April 23, 1867.—The pivoted blocks of the stanchion permit the animal to turn to a given extent. One standard is permanently secured into the pivoted upper block; the other entering through a groove in the end, passes a hinged stop block, which dropping, keeps it in position.

Claim.—All the parts of Fig. 1, except the top and bottom pieces A and B of the common tie-up—that is, all the parts C M I D E F G, which are connected together, and the said grooves, and said cut or mortise H, and the thickened part of said top piece B, (to admit of said groove,) and which make up the double swinging stanchion, which swings both ways, which allows the animal fastened to turn the head either way, as before mentioned, when standing or lying down, and to lie on either side with comfort.

64,018.—MATHEW F. MAURY, Liverpool, England.—*Fastening of Wire or wire Rope Together*.—April 23, 1867.—The ends are secured together by a weaving knot.

Claim.—The tie herein described and shown upon the drawings, when the same is used to connect the ends of wire or wire rope that is employed in baling cotton or other like material, substantially in the manner set forth.

64,019.—GEORGE MCCOY, New York, N. Y.—*Manufacture of Aerated Waters*.—April 23, 1867.—The hooped vessel has metallic head plates joined by stay rods, and the gas being introduced, the water is projected therein in small jets that it may more intimately intermingle therewith.

Claim.—First, a vessel for the manufacture of soda water or other aerated liquids, or for holding the same after being manufactured, having its sides made of wood secured by iron bands or hoops, and its two ends provided with metallic head plates joined together by stay rods or braces, and the whole constructed substantially as described.

Second, in the manufacture of soda water and other aerated liquids, discharging the water or other liquid into the vessel containing the gas or gases with which it is to be charged in the form of small jets or spray, or any other equivalent form, substantially as and for the purpose described.

64,020.—JOHN McMAHEL, Hamilton, Ohio.—*Toy*.—April 23, 1867.—The ball after projection from the cup is reinstated by a cord connecting it to a spiral spring in the handle.

Claim.—The cup A and ball E, in combination with spiral recoiling wire or spring D, for guiding the ball to the cup, in the manner and for the purpose substantially as described.

64,021.—TRUMAN MERRIAM and A. G. ALLEN, Waterloo, Wis.—*Steam Generator*.—April 23, 1867; antedated April 19, 1867.—A series of cylinders in tiers one above the other are connected by pipes formed in their end plates; the upper tier has pipes connected with a force pump, by which water or oil is introduced into the steam. The furnace walls have water pipes cast within them for the water supply. The upper portion of the furnace walls are latticed or closely perforated for attachment of fire clay with which the inside is coated.

Claim.—First, the combination of the cylinders E F G, arranged in successive tiers above the furnace and connected by pipes formed in their end plates with a corresponding set of similar cylinders into which the steam is passed from the first set, and in which it is tempered by the introduction of water or oil, substantially in the manner and for the purpose set forth.

Second, the perforated or latticed metallic walls of the furnace when constructed and arranged substantially as set forth.

Third, the arrangement of the tank C, induction

pipe H, pump I, education pipes K, and the furnace walls, substantially as set forth.

64,022.—JOSEPH MERWIN, New York, N. Y.—*Button-hole for Paper Collars*.—April 23, 1867; antedated April 8, 1867.—Circular apertures terminate each end of the button-hole forming beds for the shank of the button.

Claim.—The construction in collars of a button-hole formed by holes of circular shape or thereabouts, at opposite ends of a connecting cut or slit, the edges of which constitute flaps or wings, substantially as specified.

64,023.—JOHN MILROY, Edinburgh, Scotland.—*Eccavator*.—April 23, 1867.—The frame is supported when lowering, by chains connected by a monkey hook to the main chains, and when this hook is disengaged the points of the spades are drawn up to the frame to form a close bottom; the frame is then raised by chains, each of which is connected to a spade near the point of the latter. This is intended specially for excavating in closed shafts, or coffer dams.

Claim.—First, the framework 2, to the outer edges of which are hinged directly a series of spades I, in combination with the within-described system of chains A and B, the whole being arranged and operating substantially as and for the purpose herein set forth.

Second, the combination of the above with the hook 7, constructed and operating in combination with the chains attached to the frame and to the spades, as described.

64,024.—F. B. MORSE, New Haven, Conn.—*Joint for Carriage-top Braces*.—April 23, 1867.—The conical hinge joint on the stump alleviates the strain on the screw bolt.

Claim.—The herein-described stump joint as an improved article of manufacture, consisting in the combination of the two parts A and B, when constructed and arranged together by a conical joint, substantially in the manner and for the purpose described.

64,025.—GEORGE T. PARRY, Philadelphia, Pa.—*Steam Generator Water Gauge*.—April 23, 1867.—The glass front is secured between a semicircular back and flat strips in front, and the gauge connects with the boiler by pipes, entering below the low-water line and in the steam space.

Claim.—The construction and arrangement of the plates B C and D, whereby the water is shown in a thin sheet, substantially as set forth.

64,026.—GEORGE T. PARRY, Philadelphia, Pa.—*Boiler Feeder*.—April 23, 1867.—A pipe ascends from the water level in the boiler and has an inverted U-form; it discharges by an annular mouth into the extension of the feeder. Immediately beneath is the mouth of a pipe passing through a check valve in the bottom of the boiler. The fall of water exposes the former pipe to steam, which injects the water into the boiler through the latter.

Claim.—First, in combination with the generator A and feeder B, the pipe C, with its orifice C', and the pipe D, when arranged to operate substantially as described.

Second, in combination with the generator A and feeder B, the pipes D and C F, and float G, and valve, arranged to operate substantially as described.

64,027.—DAN PEASE, Floyd, N. Y.—*Smut Mill*.—April 23, 1867.—Improvement on his patent, September 22, 1863. The grain from the smut cylinder passes through a tortuous passage to expose it to the action of the current of air to remove impurities and worthless grain.

Claim.—The spreader shown separately in figure 3 and as connected with the smut mill shown in figures 2 and 3, and fully described in the specification, the whole being constructed, adapted, and arranged substantially in the manner herein set forth.

64,028.—WATSON PECK, York, Ill.—*Cooling Milk*.—April 23, 1867.—The milk passes from the strainer through a coiled pipe within a tank of cold water.

Claim.—The combination and application, as herein described.

64,029.—GUSTAVUS PERKINS, Burlington, Vt.—*Machine for Rolling Dough, Crushing Sugar, &c.*—April 23, 1867.—The rollers are attached to the pivoted frame with adjustable gauges for rolling dough to any required thickness. Meat-mangling and cutting rollers are also attachable.

Claim.—The combination of the metallic rollers *h* Q or R, the gauges *m*, the arms *i*, as applied to the above purpose.

Also, the construction of the entire machine, all as herein substantially described and for the purpose set forth.

64,030.—S. M. PERKINS, Morrison, Ill.—*Whiffle-tree Hook.*—April 23, 1867. Improvement on his patent, November 29, 1859.—The rubber washer fits in the chambered cap, which has a projection fitting into a notch in the shoulder of the projecting stem to keep the said cap from turning.

Claim.—The chambered cap B and washer C, the said several parts being respectively constructed and the whole combined and arranged for use substantially in the manner and for the purpose set forth.

64,031.—JACOB S. PETERSON, Springdale, Ohio.—*Weather Strip.*—April 23, 1867.—The cam on the door when pressed against the roller in the jam depresses the rod and its attendant flap against the rabbet of the carpet sill, excluding draft and rain. When reopened the spiral spring on the rod raises the flap and projects the cam.

Claim.—The strip or flap E, adapted to close against the rebate of the carpet sill by the impact of the cam K and roller D, and to be retracted by means of a spring M, substantially as set forth.

64,032.—THOMAS W. PRATHER, Iowa City, Iowa.—*Removing Buildings.*—April 23, 1867.—The winch is connected by a train of gearing to a roller journaled in the depending arms of the plate rest. This roller journal projects to receive an outrigger pulley.

Claim.—The combination of the truck wheels, crank, cog wheels, shaft, platform and screw, substantially as and for the purpose set forth.

64,033.—ALEXANDER N. REDMAN, Charlestown, Mass.—*File Cutting Machine.*—April 23, 1867.—The feed of the file blank holder is operated by a large gear wheel in combination with a small gear wheel attached to a feed screw; the large wheel receives an intermittent motion from the sliding bar and pawl, and is operated by a cam on the main shaft. The cutter holder has an inward movement at its greatest depression to throw out the surface cut and raise the tooth.

Claim.—First, the combination of the guide frame E, the pinion C, and rotating rack gear B, as described.

Second, the sliding block or bar H, provided with the pawl *i*, the adjustable projection *h*, and retracting spring I, in connection with the rotating rack gear B, substantially as and for the purpose specified.

Third, the combination of the yoke P, adjustable block N, or its equivalent, and the cutter O, operating as described substantially as and for the purpose set forth.

Fourth, the combination of the springs S S', arranged as described with the cutter head M, as and for the purpose specified.

64,034.—JOHN H. REINHART, McKay, Ohio.—*Farm Gate.*—April 23, 1867.—The vertical and horizontal parts of the gate are bolted together, and the free end supported by a roller. The securing pin has a vertical series of holes in the gate to answer in time of snow.

Claim.—The arrangement, construction, and combination of the wheel D, movable bolt J, and projections E E, so that the gate operates in the slots G and H of the post F, as herein described and for the purposes set forth.

64,035.—SAMUEL G. REYNOLDS, Bristol, R. I.—*Machine for Making Nails.*—April 23, 1867; antedated April 8, 1867.—Improvement on his patent of January 20, 1852, No. 8,677. Explained by the claims and illustration.

Claim.—Making the heads of nails, bolts, rivets, &c., by a number of consecutive upsets of a long piece of metal, by liberating or uncovering from the inclosure

of the die more and more of the metal as the header advances to upset the same, by means of successively receding sections, of which the die is in part composed, or their equivalents, substantially as described.

Also, the sliding block substantially as described, in combination with the compound gripping or molding die, the springs *g*¹ *g*², and heading lever, or their equivalents, as described, for the purpose of operating the movable sections of said die, substantially in the manner and with the effect herein set forth and described.

64,036.—J. W. RICE, Springfield, Mass.—*Car Brake.*—April 23, 1867.—The usual shaft of the hand brake has a sleeve connected by a coiled spring to a surrounding drum, which is geared to a spur wheel on another hand shaft, by whose rotation power is stored in the spring. The drum and sleeve have jointed pawls held by dogs having operating cords in reach of the engineer, and the sleeve and drum have pawl connection together. When the engineer releases the pawl of the drum it acts on the sleeve to rotate the supplementary brake shaft with which it is connected and put on the brake, and when the sleeve pawl is released the mechanism runs down and the brake is freed.

Claim.—First, in a brake for cars the combination of the drum I, having the spring L, ratchet K and J, and the sleeve F, having the spring L attached to it, and the ratchet G, with the sleeve B, having the pawl *f*, the whole arranged substantially in the manner and for the purpose set forth herein.

Second, in combination with the above arrangement, the pawls *g* and *h*, and the dogs O and P, to operate the pawls, the same constructed and operating substantially as described.

Third, in combination with the drum I, the device for turning the same, consisting of the shaft *h*, cog M and crank *z*, substantially as shown and described.

Fourth, in combination with the sleeve B, provided with the cog wheel C, the wheel D, and shaft forming a windlass for the brake chain.

Fifth, the equalizers for brake herein shown, in which the chain passes around two or more pulleys 1, 2, 3, 4, arranged in a frame S, having slots 7, in it, into which works a pin 8, substantially as shown and described.

64,037.—GEORGE ROWE, Worcester, Mass.—*Machine for Making Wooden Pins.*—April 23, 1867.—The removable hollow punches of various sizes fit a hollow stem which allows the pins to escape axially; the stem is attachable to a mortising machine.

Claim.—In combination with the removable punch or cutter E, of the hollow stem or handle A, slotted as described, so as to facilitate the withdrawal of the pins, and the removal of the punch, and otherwise constructed and arranged for operation as herein set forth.

64,038.—MARSHALL RUMRELL and ROBERT H. RUMRELL, Brooklyn, N. Y.—*Machine for Making Book Covers.*—April 23, 1867.—The stiffening pieces are placed in the receptacles of the base plate, and the cloth, paste-side up, over the recess of the sliding plate; the latter is then slid out of the way and the presser plate depressed to contact with the stiffening pieces, which adhere to it owing to the deposit of mucilage from the cups above. The presser is then raised, the sliding plate with its cloth slid under, and the presser brought down which depresses the cloth knives and attaches the stiffening pieces and cloth together. The outer slides are then moved in, to fold in the edges of the cloth, and again moved out to allow the descent of the presser upon the infolded edges of the cloth.

Claim.—First, the means herein described for taking up-stiffening papers one by one, and securing the same to the inside of book covers, substantially as and for the purpose herein set forth.

Second, the means herein described for cutting the cover at all the necessary points at once, substantially and for the purpose herein set forth.

Third, the means herein described of folding over the edges of the cover and securing the same firmly to the stiffening paper, substantially as and for the purpose herein set forth.

61,039.—THOMAS RYDER, Providence, R. I.—*Chimney Holder for Lamp Burners.*—April 23, 1867.—The spring wire-clasps embrace the chimney above the budge.

Claim.—The combined spring and clasp, in combination with the lamp burner, for the purpose all substantially as specified.

61,040.—JAMES SHEWARD and GEO. A. STANBURY, Dunkirk, N. Y.—*Car Brake.*—April 23, 1867.—The axle has a worm gear which engages a cog wheel with a friction surface on its upper side, which is brought in contact with the friction surface on a disk. This contact is caused by the depression of the disk shaft by the inclines on the hub of a lever oscillated by a cord reaching to the engineer. The shaft has a radial lever whose outer end is connected to the brakes.

Claim.—The application of the worm or endless screw, to the axle of any vehicle where the axle revolves in combination with a cog wheel to produce a slow motion under a high speed, and face plate forced upon the face of the cog wheel as described herein, for the purpose set forth.

61,041.—BALLARD C. SMITH, Ashland, Ind.—*Side Board for Threshing Machine.*—April 23, 1867.—The sections of the conveyor frame are hinged together at bottom, and have a retaining spring catch which is released by a cord. The side wind boards are hinged together and attached to one section, and are folded together for packing, as are also the main sections.

Claim.—First, the jointed side board, constructed of light sheet metal or other material hinged at E E with permanent end D and movable end C, by means of which all effects of winds are avoided on the stacker, substantially as and for the purposes set forth.

Second, the spring F and catch G, for the purposes of keeping the sections A and B in line, and for displacing the said sections when operated by cords H, substantially as and for the purpose set forth and shown, when stacker is attached to machine in the usual manner by rod M.

61,042.—GEORGE W. SMITH, Strasburg, Ohio.—*Weather Strip.*—April 23, 1867.—The door has a plate hinged to its inner side, which shuts down over the crack beneath it, and is held there by a spring to prevent entrance of wind and rain.

Claim.—The hinged strip *a*, in combination with spring *g* and metal strip *c*, constructed as described, and the whole arranged as and for the purpose set forth.

61,043.—J. Y. SMITH, Pittsburg, Pa.—*Steam Engine Piston.*—April 23, 1867.—The recess in the center of the piston has apertures leading through the sides to the space underneath the beveled packing rings, which are expanded by the steam.

Claim.—First, the central groove *a*, provided with the apertures *n*, for admitting the steam or other material to the under side of the rings, substantially as shown and described.

Second, the combination of the ring *c* and *e* with the flanges A' and plate B, or their equivalents, when arranged and operating as and for the purpose set forth.

61,044.—MORTIMER L. SMITH, Detroit, Mich., assignor to himself and J. W. HOUGHTLIN, same place.—*Seat and Back.*—April 23, 1867.—The back is attached to the seat by a pivot and folds up to make it portable.

Claim.—The combination of the strips C C, back E E B, seat A G G, and frame H D, all arranged as and for the purpose described.

61,045.—ROBERT E. SMITH, Provincetown, Mass.—*Gun Harpoon.*—April 23, 1867.—The harpoon has a hinged barb, and a slotted shank in which is a sliding link to which the line is fastened. The rear end of the slot has an elastic guard to receive the shock of the ring as the harpoon is fired.

Claim.—The head A B, grooved to receive the pivoted barb C, and cast in one piece with the slotted shank D, the latter being provided with the elastic guard *g* and the wire link E, all constructed and ope-

rating substantially as described, and for the purpose set forth.

61,046.—JOHN F. STEWART, Plano, Ill.—*Knot Indicator for Knitting Machine.*—April 23, 1867.—The unknotted yarn passes freely through the spring guide, but a knot draws the latter away from the bell and strikes it when released, as the knot frees itself from the narrow part of the guide.

Claim.—The arm C, with the knot grasper B, hammer D, and the spring E, in combination with the bell A, constructed and operating as herein described.

61,047.—P. J. STOUFFER, Uniontown, Pa., assignor to himself and HENRY WHITE.—*Composition for Preserving Eggs.*—April 23, 1867.—Composed of chloride of sodium, 8 lbs.; hydraulic lime, 5 lbs.; charcoal, $\frac{1}{2}$ lb.; nitrate of potash, $\frac{1}{2}$ lb.; alum, $\frac{1}{2}$ lb.; sulphure of iron, 5 oz.; gum arabic, 6 oz.; and water, 22 galls.

Claim.—The composition for preserving eggs, substantially as set forth.

61,048.—GEO. SUGG and W. METZ, Chicago, Ill.—*Bedstead Fastening.*—April 23, 1867.—The slotted plate is mortised into the post, and has inclined planes in its rear which engage lateral projections on the rail piece, and draw the latter firmly to the post as the rail descends.

Claim.—As a new article of manufacture, the bed fastening, consisting of the plate A, constructed as herein described, and used in combination with the plate E, provided with the arms O with the enlarged heads I, as herein set forth.

61,049.—JAMES WALBER, Washington, D. C.—*Machine for Felting Hat Bodies.*—April 23, 1867.—The surfaces of the rollers have slower movement from the front to the rear end to condense the material. They are driven by an endless chain and gearing. The boxes of the driving shaft have sliding movement to take up any looseness in the chain. The journals of the steam-heated lower rollers are extended to allow a reciprocating end movement, the steam entering their axles.

Claim.—First, the combination and arrangement in a machine for felting hat bodies of two or more pairs of rollers, having a rotary movement, when each successive pair revolves with a diminished speed, all substantially in the manner and for the purpose as herein set forth.

Second, the combination as above of two or more pairs of rollers whose diameters so vary that the circumference of each successive pair shall revolve with diminished speed, substantially in the manner and for the purposes herein set forth.

Third, the combination in a felting machine of a series of pairs of rollers, each pair of which has a lesser velocity than the preceding pair, with a series of pairs of rollers having a uniform velocity, as and for the purpose herein described.

Fourth, the combination in a felting machine of a series of rollers supported in a fixed frame, but each having an independently lateral play in its bearings in the line of its axis, substantially as and for the purpose herein described.

Fifth, imparting a lateral reciprocating movement to the rollers of a machine for felting hat bodies by means of cams on the ends of said rollers, or their journals, bearing against suitable cam surfaces when each of said rollers has free play independently of the others in the line of its axis, all substantially in the manner and for the purpose herein set forth.

Sixth, the use of a series of hollow rollers in a felting machine with suitable steam pipes for introducing steam into the same when said rollers revolve successively with a diminished speed, substantially in the manner and for the purpose herein set forth.

Seventh, the combination of a reversing roller, placed centrally in front of the last pair of rollers in a felting machine, with an auxiliary roller placed over the same, to bear thereon and operate conjointly therewith, substantially in the manner and for the purpose herein set forth.

Eighth, the combination of a single endless chain and toothed wheels, with two series of rollers in a felting machine, substantially as and for the purpose herein described.

Ninth, the combination of suitable springs with the sliding journal boxes of the driving shaft, and with an endless chain working thereon, all substantially as and for the purpose herein set forth.

64,050.—SAMUEL JACOB WALLACE, Keokuk, Iowa.—*Hay Stacker.*—April 23, 1867.—The rope from the singletree passes under a sheave at the base of the frame, and under a sheave at the upper end of the inclined head beam, which forms a slide bar to a sheave block, through which the cord passes to the fork. The loaded fork is drawn to the sliding block, when its passage is checked by the eye of the pendent bar and passes upward on the slide. It is tripped by a cord reaching to the ground.

Claim.—A portable hay stacker having the several parts thereof constructed, arranged, and combined as and for the purpose set forth.

64,051.—WILLIAM WHEATON, Brooklyn, N. Y., assignor to JOHN F. LEE, jr., same place.—*Spool Holder for Sewing Machines.*—April 23, 1867.—The spool is firmly held on the stem of the cylinder. The latter is free to revolve on its spindle, a screw through the cylinder running in a groove. The spring is not adjustable, but the plate which supports it is adjustable by means of a nut, so as to cause the spring to embrace the flange on the cylinder more or less tightly.

Claim.—The cylinder A A', spring s, or its equivalent, screw c, horizontal plates d and e, combined and operated in the manner and for the purpose set forth and shown in the accompanying drawings.

64,052.—JEROME WHEELOCK, Worcester, Mass.—*Steam Engine Piston.*—April 23, 1867.—The hollow piston has an annular groove to receive packing rings; its plates are mutually supported by stay bolts. The central hole is oblong to permit the axial adjustment of the rod, and the end of the latter is split to relieve the pressure of expansion within the nut.

Claim.—First, the combination of stay bolts E E E E with a piston head, substantially in the manner herein described.

Second, a piston constructed with an oblong hole or aperture through its center to receive the piston rod, substantially as and for the purpose described.

Third, the slot in the piston rod B when used for the purpose of relieving the nut, in the manner substantially shown and described.

64,053.—JOHN WILLIAM WHITFIELD, New York, N. Y.—*Needle Wrapper.*—April 23, 1867.—The thread is looped to the wrapper and the needles inserted in regular gradation.

Claim.—A needle wrapper composed of a sheet of fabric combined with a series of thread loops to hold the needles to the fabric, substantially as set forth.

64,054.—JOHN WHITLOCK, Birmingham, Conn.—*Self-Oiling Journal Box.*—April 23, 1867.—The disk gathers oil from the cup and spreads it by means of the passages over the journal along which it passes toward the ends of the boxing, and is led back to the reservoir.

Claim.—In combination with a shaft or journal having a wheel, disk, or ring attached to that portion that revolves in the journal box, and with distributors for carrying the oil over the shaft or journal, the vertical end passages and horizontal passages leading from said ends back to the recess or reservoir, for the purpose of making a self-oiling device, substantially as described.

64,055.—ALBERT H. ACKEN, Griggstown, N. J.—*Rotary Harrow.*—April 23, 1867.—The outer points of the harrow have jointed teeth, which by resistance at one part of their revolution cause rotation when the harrow is drawn forward. The top plate at the junction of the central bolt is sprung up to insure a steadier draft.

Claim.—The frame A' when constructed as described, in combination with the jointed teeth B', center pin C', and draft rod D, all arranged and operated as specified.

64,056.—J. B. ALEXANDER, Washington, D. C.—*Lamp Burner.*—April 23, 1867.—The corrugated

sides of the wick plates are engaged by the two friction collars which are journaled to the sides of the wick tube. The plates are fastened together and the wick raised between them by a pin. The reservoir is filled by a funnel with a long stem which is introduced into the wick tube.

Claim.—The wick holder, composed of the corrugated plates O and P with their turned edges and indentations K K K K K K K K, and the slot G, substantially as and for the purpose set forth.

Also, in combination with the above described wick holder, the device for raising and lowering the wick, substantially as and for the purpose set forth.

Also, the device L M for filling the lamp fountain with oil, in combination with the burner, substantially as described and for the purpose set forth.

64,057.—WILLIAM ALTICK, Darton, Ohio.—*Machine for Cultivating Cotton.*—April 23, 1867.—The clutch rod by the driver's seat brings into action the train of gearing and the wheel to which the adjustable hoes are attached, working transversely of the rows. The plows attached to the transverse metallic bar cultivate between the rows.

Claim.—First, the arrangement of the shaft C, with its clutch and bevel wheel, with the pinion T, shaft W, and wheel N, provided with its adjustable hoes, the several parts being constructed and used as and for the purpose specified.

Second, adjusting the arms O O in the wheel N, by means of their grooves and the pins b b, substantially as and for the purpose specified.

Third, the bar H, upon which the plows or cultivator teeth are secured, used in connection with the grooved plates a a, rock shaft k, with its arms and lever J, substantially as and for the purpose specified.

64,058.—ALBERT F. and JOHN H. ANDREWS, Avon, Conn.—*Mode of Treating Flax.*—April 23, 1867.—The fiber is placed in a skeleton cylinder or endless bag, and, by rotary movement, is alternately immersed and withdrawn from hot or cold water, with which the vat is alternately filled. After the water treatment the fiber is treated with a caustic solution of soda and lime and afterward washed with water.

Claim.—First, treating it by the aid of the endless double network arranged relatively to the rollers "G II" and to the tank, substantially as and for the purpose herein specified.

Second, in combination with the above, subjecting it to the action of the pressure roller J, arranged as represented.

Third, the alternate application of warm and cold water, substantially in the manner and for the purpose herein described.

Fourth, the treatment in the soluble protein solution obtained from ground beans or other equivalent, substantially as specified.

Fifth, the treatment with the chloride of sodium, or its equivalent, after the treatment with the alkali before the bleaching, substantially as herein specified.

Sixth, the employment of metallic chlorides in the bleaching bath, substantially as and for the purpose herein specified.

Seventh, blowing atmospheric air through the interstices, after the material to be bleached has been immersed in a solution containing chloride of lime, whether this solution is prepared in the ordinary manner or as above described.

Eighth, the use of alkaline solutions after bleaching, substantially as and for the purpose herein specified.

Ninth, the treatment with urine, in connection with the treatment with soap, substantially as and for the purpose herein specified.

Tenth, the treatment with cider, or equivalent vegetable acid solution, at the termination of the process.

Eleventh, the use of atmospheric air forced through the flax, in connection with an alkaline solution, saturating the flax, as a bleaching and disintegrating agent, substantially as herein specified.

64,059.—WILLIAM H. ARMSTRONG, New Brunswick, N. J.—*Range and Air Heating Furnace.*—April 23, 1867.—The grate has a water back and a horizontal flue extending backward beneath the lower oven to the upright flue, which has forward projections between the ovens and a warming shelf. Hot air spaces occupy space on each side of the ovens.

Claim.—The arrangement of the cooking range, its appurtenances A B C F G, flue H, chambers I M M, air passages E E, water back D, and auxiliary pipe O, as herein described, and for the purpose specified.

64,060.—ROBERT BAILEY, Idaho City, Idaho.—*Quartz Crusher.*—April 23, 1867.—The revolving cylindrical mortar bed is enclosed in a wooden and metallic case running on friction rollers, and is composed in part of rock and cast-iron dies fitted to form inclined planes on the inside, and in part of loose, cast-iron, cubical blocks, which are lifted by the revolution and grind by sliding and tumbling upon the quartz placed in the mill.

Claim.—First, the construction of the rotary mortar bed enclosed within the case A, made of blocks of rock b b b, forming inclined planes of irregular dimensions on their inside surfaces, combined with cast-iron dies c c c, fitted in and secured to them, arranged and applied as and for the purpose herein described.

Second, the cubical stamp d, in combination with the revolving mortar bed, constructed and operated together in the manner and for the purpose herein set forth.

64,061.—JACOB BERGEN, Canton, Ohio.—*Cultivator.*—April 23, 1867.—The oscillation of the crank axles adjusts the height of the frame. The levers operate between guides, and lugs engage with slots in the guide to maintain the adjustment.

Claim.—The arrangement of the crank axles D D with the levers H, spring a, and guides I and J, substantially as and for the purpose specified.

64,062.—ADOLPH BINNER, Muscatine, Iowa, assignor to himself and JOHN LEUZINGER, same place.—*Window Shade.*—April 23, 1867.—Round rods are used for a woven slat blind instead of flat slats; rolling more readily, there is less friction on the cord.

Claim.—A window curtain or shade composed of round sticks of wood connected together, substantially as described.

64,063.—J. W. BLISS, Hartford, Conn.—*Clothes Line.*—April 23, 1867.—Explained by the claim.

Claim.—A clothes-line of cord, leather or wire, coated with india-rubber or gutta-percha to protect the same from the weather, all as and for the purpose specified.

64,064.—SAMUEL F. BOND, Worcester, Mass.—*Self-lubricating Journal Box.*—April 23, 1867.—Explained by the claim and illustration.

Claim.—A self-lubricating journal box, constructed substantially as described, with a chamber or chambers forming oil reservoirs along either side of the journal, also provided with lower supply-apertures, and their upper inner edges made to form scrapers or cleaners for removing surplus oil and to return it to the reservoirs, essentially as herein set forth.

64,065.—JOHN K. BOSWELL, Richmond, Ind.—*Fruit Dryer.*—April 23, 1867; antedated March 16, 1867.—Improvement on his patent, September 4, 1866. The hollow triangular prism is capable of revolution to expose its sides in the required position, for radiation, or to heat articles placed upon it. The structure fills the functions of a heater, dryer, wardrobe or bleaching apparatus.

Claim.—First, the revolving triangular heater D, arranged as and for the purpose set forth.

Second, the shield b, when provided with apertures and arranged substantially in the manner and for the purposes specified.

Third, the combination of the furnace N, when provided with tube i, or its equivalent, the revolving triangular heater D, when provided with tube j, or its equivalent, and the chimney K.

Fourth, the sliding panel C, substantially in the manner and for the purpose described.

64,066.—LUCY BROAD, St. Louis, Mo.—*Child's Toy.*—April 23, 1867.—The horizontal disk has a winch at the side and gearing beneath by which the sulkies thereupon are caused to move around.

Claim.—The combination of the figures C¹ C² with the circular plate or race track C, and with the actuating machinery, as described and set forth.

Also, the bell B', in combination with the other parts, as described and set forth.

64,067.—J. J. BROWN, Madison, Wis.—*Carriage Thill Coupling.*—April 23, 1867.—The spindle on the thill iron is entered through the slot in the shackle, and the opening is closed by a key which rests against the erect arm, while the horizontal arm passes below the axle and is engaged by the axle clip.

Claim.—First, the bar A, provided with the vertical arm B for attaching the button independent of the clip or band, substantially as and for the purpose set forth.

Second, making the socket for the reception of the packing and bolt between the front side of arm B and the front covered end of A, as shown and described.

64,068.—S. H. BROWN, New York, N. Y.—*Rotary Steam Engine.*—April 23, 1867.—The abutment valve after the passage of a piston descends by the pressure of entering steam against the convex side of the semi-cylindrical stop. When reversing the engine the said stop is turned flat side up, in which position it admits the passage over it of the said valve.

Claim.—First, the abutment or valve E, constructed as described, and pivoted so as to vibrate in either direction, substantially as and for the purpose specified.

Second, the semi-cylindrical reversible stops i, in combination with the hinged abutment E, annular rims a, and piston wheels C with pistons D, all constructed and operating substantially as and for the purpose set forth.

64,069.—JOHN W. BURNS, Henry, Ill.—*Brick Machine.*—April 23, 1867.—The plungers are operated by toggle arms and a rock shaft connected by links to vertically sliding racks whose operating segment pinions have arms actuated by a horizontal bar on the main shaft. The molds are forwarded by a rack and segment gear wheel operated by a lever.

Claim.—First, operating the plungers I I through the medium of the shaft F, connected by arms and links to vertical racks G, pinions on segments H, provided with arms e, and the arm E on shaft C, all being arranged substantially as herein shown and described.

Second, the arrangement of the mud mill A, plungers I I, and molds J, substantially as herein set forth.

Third, the feeding of the empty molds to receive the clay and the discharging of the filled molds from the press by means of the racks N and pinions O, substantially as shown and described.

64,070.—THOMAS H. BURRIDGE, St. Louis, Mo., assignor to himself and G. C. FABIAN, same place.—*Steam Safety Valve.*—April 23, 1867.—By the shifting of the point of contact of the levers the pressure of the weight increases as the levers are raised so as to insure the closing of the valve immediately when the pressure of the steam is reduced.

Claim.—The levers E F, constructed and arranged in relation to each other and valve, substantially as and for the purpose set forth.

64,071.—D. C. CANNELL, La Fayette, Ind.—*Draw Bar for Locomotives.*—April 23, 1867.—The link is sustained by the sides of the recesses, but has a certain amount of play therein to adapt it to different heights of cars or to vertical oscillation in use.

Claim.—A draw bar A, provided at one end with V-shaped recesses b, one at each side with a link B fitted in it and working within the recesses, substantially in the manner and for the purpose set forth.

64,072.—CHARLES E. CASE, Xenia, Ohio.—*Valve for Steam Engines.*—April 23, 1867.—The valve seat rests in a loose cup and has a spiral stem fitting neatly in a socket; the stem acts as a guide and as a means of rotation by the passing steam. Cavities in the head allow the passage of steam when it is raised.

Claim.—The valve C and spiral pin H, constructed and arranged substantially upon the principle and in the manner herein set forth.

64,073.—PIERRE CHARLIER, Paris, France.—*Shoeing Horses.*—April 23, 1867.—The shoe is so let into a groove that its outer sides will be flush with the outside and bottom of the hoof respectively.

Claim.—The method herein described of attaching

the shoe to the hoof of a horse or other animal by letting said shoe into a recess cut into the edge of the hoof, substantially in the manner and for the purpose set forth.

64,074.—EDWIN CLARK, Lancaster, Pa.—*Window Sash Frame.*—April 23, 1867.—The strips enter grooves in the stiles and have projecting plates perforated to receive securing pins. The sashes are grooved for the balance cords and upwardly inclined notches receive the knots of the same. One side of the lower sash is divided vertically transversely, and the outer part has a tongue entering a groove of the other part arranged so as to support it by means of the balance cord, but so that it may be detached for removal.

Claim.—First, the inclined tongue *d* and corresponding groove *c* on the pieces *b* and *b'* respectively of a window sash, substantially as and for the purposes described.

Second, the projections *d'* on the inclined tongue *d*, slots *c'*, springs *d²*, and eyes *c²*, on the pieces *b* and *b'* respectively of a window sash, substantially as and for the purpose described.

Third, the eyes *g'* on the strips *g* and pins *j* passing through the same and the window frame, substantially as described.

Fourth, the tongue *g²* on the strip *g*, and corresponding groove in the frame *A*, substantially as and for the purposes specified.

Fifth, the above described mode of removing and replacing window sashes from frames, substantially as and for the purposes specified.

64,075.—P. J. CLARK and JOSEPH KINTZ, Meriden, Conn., assignors to SAMUEL S. CLARK, same place.—*Lantern.*—April 23, 1867.—The guards for retention of the globe are attached to the cap above and to a ring at the middle of the bulge. One guard is hinged to the ring below; the others are clasped by catches.

Claim.—First, the guards *D*, any suitable number constructed, each of one piece of wire bent or doubled, attached to the cap *B*, and arranged so as to retain the glass globe *F*, substantially as set forth.

Second, the connecting of the lower end of one of the guards *D* to the base *A* to form a hinge or joint *c* with a catch or fastening *e* secured to the base *A* to catch over the lower end of the guard which is in line with it, substantially as shown and described.

64,076.—JOHN CLARRIDGE, Pancoastburg, Ohio.—*Corn Planter.*—April 23, 1867.—The devices are intended to enable the machine to drop accurately, cover securely, and adapt itself to the unevenness of the ground over which it passes.

Claim.—First, the steel plow *H* when constructed and attached to the shank *I*, substantially as herein described and for the purpose set forth.

Second, the combination of the slide bars *M*, the inclines *P'*, or equivalent arms or levers *D'* and valves *B'* with each other and with the plow frame *E*, substantially as described and for the purpose set forth.

Third, the combination of the circular valve *V* with the seed reservoir *T*, hopper *S*, and sliding bar *M*, substantially as herein described and for the purpose set forth.

Fourth, the combination of the upwardly projecting pins *J'* with the valves *H'* or *V'*, and with the seed reservoir *T*, substantially as herein described and for the purpose set forth.

Fifth, the combination of the vertical stirring shaft *K'* having horizontal arms with the seed reservoir *T*, hollow shank *I*, and with sliding bar *M*, substantially as described and for the purpose set forth.

Sixth, the coupling *G*, when constructed substantially as herein described and for the purpose set forth.

Seventh, the combination and arrangement of the seed reservoir *T*, hopper *S*, arms *V*, levers *W¹* *W²*, and connecting rods *A¹* *A²* with each other, with the sliding bar *M* and with the plow frame *E*, substantially as herein described and for the purpose set forth.

Eighth, the combination of the lever *O* and *P* and sliding bars *M* with each other, with the plow frames *E*, and with the frame *A* of the planter, substantially as described and for the purpose set forth.

Ninth, the combination of the cords *X'*, pulleys *B²*, shaft *V'*, ratchet wheel *Y'*, pawl *Z'*, bevel wheel *U'*, and foot wheel *S'*, with each other, with the plow

frames *E*, and with the frame *A* of the planter, substantially as herein described and for the purpose set forth.

Tenth, the combination of the lever *P'*, slide bar *N'*, and bent lever *M'*, or equivalents, with each other, with the slide bars *M* and with the frame *A* of the planter, substantially as described and for the purpose set forth.

Eleventh, the combination of the shovel plow *I*, and strengthening rods *A³*, with each other and with the flanged lever end of the hollow shank *I*, substantially as described and for the purpose set forth.

Twelfth, constructing the hollow shank *I* with a double convex head *i i'*, cast upon its upper end and a projecting flange *i²* and arms *i³* upon its lower end, substantially as described and for the purpose set forth.

Thirteenth, placing the seed reservoir *T* directly above the hoppers *S*, and cutting away the side of said hoppers, substantially as described and for the purpose set forth.

64,077.—WILLIAM CLISSOLD, Dudbridge Works, near Stroud, England.—*Feeding Mechanism for Carding Machines.*—April 23, 1867.—The fibrous substance is put in a box, from whose lower side groove it is delivered by the reciprocal, forwardly-inclined fingers at the bottom; the material then passes between reciprocating cards to the pressing and forwarding rollers.

Claim.—First, the combination with the inclined reciprocating bars *B* of the reciprocating comb bars *F*, and rods or pressers *K*, for the purpose of discharging the wool or other fibrous material from the feeding box.

Second, the combination with the reciprocating comb bars of pressing rolls *P*, for delivering the wool or other fibrous material to the preparing machine in the form of a bat or sheet.

64,078.—BENJAMIN R. COTTON, Lewiston, Me.—*Roll for Yarn Dressing Machines.*—April 23, 1867.—Old, worn, metallic rolls are coated with metal by casting, plumbing, or in an electro-metallic bath.

Claim.—A dresser roll having a metal coated surface, substantially as set forth.

64,079.—LEWIS B. COVERT, Chicago, Ill.—*Paper File.*—April 23, 1867.—The slides receive the heads of the perforating clasps, to which the papers are attached. When the required number of papers are filed the split ends of the clasps are turned over, making a book.

Claim.—The file or binder, formed of the cover *a* and slides *b*, in combination with the perforated clasps *c*, as and for the purpose specified.

64,080.—JOHN CROCO, Holmesville, Ohio.—*Potato Drill.*—April 23, 1867.—The endless band running on the grooved pulley attached to the wheel actuates the perforated seed disks, which furnish the seed to the tube below at adjusted intervals; the seed is passed from the hopper spout to the seed disk by the operator; a pendent shovel covers the seed.

Claim.—First, the disks *F F'*, constructed and arranged in combination with the guide or tension pulley *J* and pulley *H*, for the purpose and in the manner set forth.

Second, the disk *F F'*, hopper *L*, in combination with the tube *E* and shovel *K*, as and for the purpose described.

64,081.—JOHN L. DIBBLE, New York, N. Y.—*Exercising Club.*—April 23, 1867.—The metallic cylindrical shells contain weights adjustable by rotation of the central screw rod.

Claim.—The metallic cylindrical shell *A A* and the central rod *D D D*, as arranged and combined with the blocks *B B* and *C C*, and adjustable weights *F F*, the whole forming an exercising club, substantially as herein described and set forth.

64,082.—ALEXANDER DICK, Buffalo, N. Y.—*Carriage for Children.*—April 23, 1867.—The wire carriage body is attached to the axles by curved wire springs, and the spokes of the wheels are twofold, radiating from the inner and outer periphery of the hub to the perimeter of the wheel.

Claim.—First, a carriage body formed and constructed of wire, substantially as described.

Second, in combination with a carriage a seat made adjustable, substantially as described.

Third, the arrangement in a carriage of the springs W W and D D, substantially as described.

64,083.—L. M. DOUDNA, Elmira, N. Y.—*Horse Hay Fork.*—April 23, 1867.—The claw tines are pivoted to the inner tube, and are so connected to the sleeve that when the said tube is released from the trip catch, the tines will expand and discharge the load.

Claim.—The tube A and sleeve E, in combination with the spring F, tines or teeth C, lever G and link H, all arranged to operate in the manner substantially as and for the purpose specified.

64,084.—THOMAS H. DUNHAM, Boston, Mass.—*Carpet Wadding.*—April 23, 1867.—Improvement on his patent May 1, 1866, No. 54,312. The fiber is enclosed between two sheets of paper web in its moist state, the selvages of which extend outside the fiber, and are pressed together, making a close sack around the said fiber.

Claim.—A wadding or fabric, having an adherent border or selvage formed of the sheets of paper that project beyond the edges of the batting, and attached to each other, as herein specified, without the use of gum or other adhesive substance, substantially as described.

64,085.—JOHN ENRIGHT, Louisville, Ky.—*Game Register.*—April 23, 1867.—The hand lever by which the works are operated has a finger indicating the number of points in its segmental guide, and its adjustable pawl engages the revolving wheel by either a right or left-hand sweep. The wheel shaft has a tooth, which moves a segmental rack and its indicating finger one point to each revolution of the larger finger.

Claim.—The construction and arrangement of the arm G, working loosely on shaft d', having tooth K upon its inner end, and provided with the double pawl H, spring P, indicating finger T, its lower end working through the slotted segment R, attached to the frame A, toothed wheel D, toothed sector J, bearing the indicating finger L, springs O O I and indicating fingers F, substantially as herein shown and described.

64,086.—OLIVER ETNIER, Mount Union, Pa.—*Cultivator.*—April 23, 1867.—The rudder blade is attached to the rear end of the center beam, and is adjusted by a lever held in position by a rack above. The handles are attached to the cross beams, and united by a cross-bar behind.

Claim.—The combination of the guide blade or rubber B, placed on the rear of the projecting center beam B, and the handles C C attached to the cross beams a, b, arranged and operating substantially as and for the purpose herein described.

64,087.—JAMES W. EVANS, New York, N. Y.—*Car Spring.*—April 23, 1867.—The ends of the spring are placed in spiral recesses in both bottom and top of the cast-iron box, dispensing with grinding them flat.

Claim.—The spiral surface grooves c and e, for the reception of the terminal coils of the spring, cast in the bottom of the box A and head of its cover C, or in any other cast metal bearings provided for the spring, substantially as herein specified.

64,088.—SAMUEL B. FAY, Franklin, Pa.—*Ticket Fastener.*—April 23, 1867.—The legs of the wire loop are twisted to cross each other and form a spring to clasp the ticket against the edge of an object.

Claim.—The loop wires D, twisted and crossing each other for the purpose described, as a new article of manufacture.

64,089.—EDWARD B. FISH, Glen's Falls, N. Y.—*Nicking Screw Heads.*—April 23, 1867.—The ordinary slit or nick has a cavity in the center to receive a corresponding extension on the driver, thus overcoming the danger of the driver slipping out of the nick and marring the furniture.

Claim.—A nicked screw provided with a cavity b in its head, substantially as specified.

64,090.—ADDISON C. FLETCHER, New York, N. Y.—*Air Heating Apparatus for Steam Boiler Furnaces, &c.*—April 23, 1867; antedated April 18, 1867.—The chimney is surrounded by an annular air chamber, closed below and having openings to admit the air at top. The opposite sides of this chamber are connected through nearly their whole height by a flattened diametric pipe. At the bottom of the chamber there are two branch pipes which carry the heated air to a fan blower, from which it passes to the furnace.

Claim.—The air passage or passages E, extending transversely across and through the smoke pipe, chimney flue or exhaust pipe for the whole or nearly the whole length of, and in combination with, the jacket D, surrounding the said pipe, chimney or flue, substantially as and for the purpose herein specified.

64,091.—D. L. FURNIER, Rostraver, Pa.—*Riddle for Sand Washers.*—April 23, 1867.—The screen revolves on its axle, being operated by a hand crank and wings on the axle; running water passes through the trough to separate the particles of sand and prevent clogging of the meshes.

Claim.—A hollow screen or riddle, revolving on an axis, with one portion always immersed in a vessel through which a stream of water constantly flows, when said riddle receives the earthy sand into its interior at one end and discharges the coarser particles over a tail chute at the other end, as set forth and described.

Also, in combination with a hollow revolving riddle, constructed substantially as described, and revolving in a water trough B, the chute M, and stirrers N N, for the purposes set forth.

Also, in combination with a hollow revolving riddle, constructed substantially as described, the web P and tail spout L, for the purposes set forth.

Also, in combination with a hollow revolving riddle, constructed substantially as described, the wings O O, upon its outer side, to agitate and remove the sand from the trough, as set forth.

Also, the combination with the hollow revolving riddle and bed frame A, provided with the trough B and waste chute C, constructed and arranged as set forth and described.

64,092.—WM. FUZZARD, Chelsea, Mass.—*Carpet Lining.*—April 23, 1867.—The corrugations confer elasticity.

Claim.—As a new article of manufacture, a carpet lining constructed of stiff paper, pasteboard, or a sized textile or other suitable fabric, bent, corrugated, or folded, to effect the result, substantially as herein set forth.

64,093.—JOEL GARFIELD, Groton, Mass.—*Hay and Cotton Press.*—April 23, 1867.—The follower is progressively forced down by toggle levers with co-operative ratchet and pawl attachments. The follower is swung up with the hinged frame to open the press.

Claim.—In combination with the follower, the grooves or ways at the ends of the press and their sliding pins, the vertical ratchets and their double set or sets of pawls and toggle levers, when so arranged that an intermittent progressive movement is imparted to the follower by their co-operative movements, substantially as set forth.

Also, in combination with the follower, the hinged frame d, by which the follower may be swung up to leave the press open, substantially as set forth.

64,094.—GEORGE W. GRADER and MATTHIAS H. BALDWIN, Memphis, Tenn.—*Street Pavement.*—April 23, 1867.—The iron frame for the reception of the wooden blocks is made in sections, and the lower flange of each alternate corner is cut away angularly to receive the alternately salient corners of the adjoining sections.

Claim.—Interlocking the sections of the frame A by means of the protecting flanges c on every alternate corner of each section, fitting into a recess b under the corner of the opposite section, thereby preventing the pavement from settling or getting out of line, as herein shown and described.

64,095.—C. S. S. GRIFFING, Geneva, Ohio.—*Combined Fence and Gate.*—April 23, 1867.—Improvement on his patent May 24, 1864. The panels are supported by the angular frames, which are stayed laterally by braces. The bars projecting beyond the cleats slide into and are secured by the angular frame. The top of the gate is secured by notches embracing the cross-ties on the posts.

Claim.—The panel G, arranged as described, and in relation to the panels A and braces B, when combined so as to form a gate and panel, jointly, in the manner and relatively as specified.

64,096.—JACOB B. HAINES, Millersville, Pa.—*Fruit Gatherer.*—April 23, 1867.—The curved fingers are attached to a shaft with which the actuating wire communicates; the apple is thrown into the hood, the coil around the shaft reinstating the fingers in position. Elastic bands around the sleeve break the fall of the fruit, and an extension sleeve is attached by buttons.

Claim.—The arrangement of the fingers A, lever arms E, in combination with the coiled springs D, all surrounding a rigid shaft B, centrally affixed to the top of the pipe K, and also connected with the horizontal and vertical bows I K, the latter connected by cross curves L M N, operating jointly in the manner and for the purpose specified.

Also, in combination with the specific framework, the use of a sleeve or bag N, elastic bands O, buttons P, actuating wire F, cord H, and handle S, all arranged and operating in the manner and for the purpose set forth.

64,097.—MANLEY HALL, Livonia, Mich.—*Potato Digger.*—April 23, 1867.—The scoop is pivoted to the lower angle of the stays, and is vertically vibrated by ropes running over pulleys and connecting with the shaft, ratchet and pawl lever above. An elevator with cross-ties and rigid teeth receives the potatoes from the scoop and passing over a series of parallel bars drops them on the suspended sieve, which is operated by a train of gearing in connection with the driving wheel. The potatoes on leaving the sieve fall into conductors which deposit them in baskets.

Claim.—First, the scoop E, grating *f*, and bars M, as arranged in combination with the elevator, as constructed, of the belts L and cross-ties L', armed with the teeth *a*, and the rake Q, for the purpose and in the manner substantially as set forth.

Second, the sieve N, conductors P P', when arranged and operated conjointly in combination with the elevator and rake Q, and scoop E, as and for the purpose substantially as herein described.

64,098.—THOMAS HALL, Boston, Mass.—*Voltaic Bracelet.*—April 23, 1867.—Curved lips and slots connect the voltaic plates, which with a buckle and strap constitute a voltaic band.

Claim.—The series of plates, of different metals, attached to each other by double hooks, formed upon one side of each plate, and entering corresponding slots cut at the opposite edge of each plate, the hooks being passed through the leather or cloth strap, and clinched upon the side opposite to the plates, substantially as herein described.

64,099.—CYRUS H. HARDY, Charlestown, Mass., assignor to himself and GEORGE JAQUES, Boston, Mass.—*Apparatus for the Manufacture of Soap.*—April 23, 1867.—The different ingredients or separate charges are discharged from the upper tier of kettles into the lower kettle by pipes; the latter kettle has curved disks rotating in contrary directions at its bottom to stir the soap.

Claim.—Placing the several soap-forming ingredients in separate and independent receptacles B E F with or without steam jackets, and provided with pipes *e f g* for conducting the ingredients to the receptacle G, in which they are heated, the supply of the ingredients thereto being regulated by suitable valves or stop cocks *h i j*, substantially as and for the purposes specified.

Claim.—In connection with the above the employment of agitators I J, operating substantially as set forth.

64,100.—SAMUEL and DANIEL A. HARRIS, Shippenburg, Pa.—*Horse Hay Fork.*—April 23, 1867.—

The back end of the tine is connected by a rod to the end of the trip lever which forms one portion of a toggle. The weight of the load keeps the tine extended until tripped by the trigger cord.

Claim.—Pivoting the lever E to the forked arm F of the bar A, and to the lever D as herein described, in such a manner that the weight upon the finger C will cause the upper end of the lever E to be drawn toward said bar A, thereby securing and retaining the finger C in a horizontal position, as herein shown and described.

64,101.—STEWART HARTSHORN, New York, N. Y.—*Window Shade Roller.*—April 23, 1867.—The weighted blind and spring counterbalance each other, so that a slight pressure of the hand will operate the blind.

Claim.—The construction and arrangement of the short fixed shaft E above the shade roller A, surrounded by the spiral spring D, one end of which is secured thereto at *b*, the other end attached to the loose hub F of the gear wheel C, meshing into the gear wheel B upon the end of the shade roller, substantially as herein shown and described for the purpose specified.

64,102.—ELIZABETH HAWKS, Troy, N. Y.—*Auxiliary Air Chamber for Stoves.*—April 23, 1867.—The oblong rectangular cover is open toward the fire and at the bottom, and has a slot in front for admission of a raker. It is used for heating the air previous to its entering the fire chamber.

Claim.—The shield A with the open horizontal slot B near its top, constructed and used as and for the purpose set forth.

64,103.—JOHN HEGEMAN, Viseher's Ferry, N. Y.—*Pontoon Boat.*—April 23, 1867.—The bottom, sides, and inclined ends of the boat are connected by hinges and engaged by hooks when in the position for use or transportation.

Claim.—The combination of the hinged parts consisting of the bottom A B, the end sections C, central sections F, and side end sections H, when the sides and end sections are so constructed as to fold over on the bottom of the boat, in the manner described.

64,104.—THOMAS N. HENDERSON, Jackson, Mich., assignor to HENDERSON and COOLEY.—*Horse Hay Rake.*—April 23, 1867.—The drop is adjustable on its cross bar and is operated by a lever attached to the same.

Claim.—The combination of the adjustable drop C, rolling cross bar K and operating lever E, with each other and with the handles G' and teeth I of the rake, substantially as herein shown and described and for the purpose set forth.

64,105.—BENJAMIN HILBERT, Cincinnati, Ohio.—*Lubricator for Machinery.*—April 23, 1867.—Explained by the claims and illustration.

Claim.—First, the transparent reservoir consisting of a glass globe A in which the decrease of the lubricating material may be observed without detaching it from the bearing, and allowing of its insertion in an inclined position.

Second, a conducting pipe E with its end resting upon the journal or other moving metal, so that the surface of said metal closes the orifice when at rest, and when in motion acts mechanically to draw out a sufficient quantity of oil, as herein set forth.

Third, a lubricating apparatus constructed in two portions, one permanently attached to the box or in other desired position, while the reservoir and conducting pipe are simply inserted in this outer pipe so as to be removable at pleasure.

Fourth, the arrangement of screw-threaded outer pipe G and pinching nut I to enable the adjustment of the tubes, as shown and set forth.

64,106.—J. DEAN HUFFMAN, Springfield, Ohio.—*Stump Extractor.*—April 23, 1867.—The cylindrical fulcrum has eccentrically journaled wheels which are raised from the ground when the action commences, but are brought down to sustain the stump and enable its removal after it is drawn from the ground.

Claim.—First, the lever A of a stump puller in com-

bination with the cylindrical fulcrum B, supporting the wheels C, eccentrically attached thereto, substantially in the manner and for the purpose set forth.

Second, in combination with the slotted lever A, eccentrically attached, the fixed cylindrical fulcrum B, adjustable extension hook D, and stirrup E, when constructed and arranged substantially as set forth.

Third, the arrangement of the slotted lever A with the plate A² and bite A³, adjustable extension hook D, and chain F, and eccentrically attached fixed cylindrical fulcrum B, substantially as set forth.

Fourth, in combination with the lever A, eccentrically attached fixed cylindrical fulcrum B, and stirrup E, the hooked clevis x, substantially as and for the purpose set forth.

64,107.—WM. HUMPHREYS, JR., Cold Spring, N. Y.—*Machine for Blocking and Stretching Hat Bodies.*—April 23, 1867.—The body of the hat is held by an inside cap piece next to the brim and a corresponding cylindrical piece over the outside; a series of levers working on half journals are connected to the inner piece, and spring fingers hold the edge of the brim while stretching; a series of adjustable pieces connected to the outer annulus, coming between the levers, give an extra stretch to the brim, to enable it to retain its shape when unblocked; the body and crown are stretched by the series of levers attached to the inner annulus acting in connection with the circular wedge piece. Arrangements are cited for the vertical adjustment of the outer annulus and its connected portions, and for holding it in position.

Claim.—First, a series of stretchers O, in combination with the levers F, for the purpose of overstretching the brim, substantially as described.

Second, making the said stretchers adjustable vertically so as to regulate the extent of stretching, substantially as described.

Third, the combination of a series of levers F, hinged to the base plate D, springs i, and levers or clamps G, rods H, and plate I, constructed and operating substantially as described.

Fourth, the sleeve J, which carries, by means of its connections, the wedge M, for operating the levers N, made adjustable in a vertical direction, substantially as set forth.

Fifth, a series of levers N, hinged to the stationary base plate D, in combination with the circular wedge M, adjustable sleeve J, and its connections, arranged and operating substantially as described.

Sixth, the combination of rods Z Z', catches j, springs k, pins r, slotted levers Y, and shaft W, arranged to operate the cylindrical cap piece E, substantially as described.

Seventh, in combination therewith with the lever a, rods d and e, wheel U, and its pin m, for governing the operation of the same, substantially as described.

Eighth, the arrangement of the hand lever e, with the projection t, and stop o, on the rod Z', in combination with the tappet arrangement of the pin n, on wheel U, and the projection g, on rod f, constructed and operating substantially as set forth.

Ninth, the base plate D, to which are hinged the levers F, in combination with the cylindrical cap piece E, carrying the brim stretchers O, the whole arranged and operating substantially as and for the purpose set forth.

Tenth, the lever F, having its journal arranged to operate with base plate D, substantially as described and for the purpose set forth.

64,108.—A. B. HURD, Watkins, N. Y.—*Gate.*—April 23, 1867.—The friction rollers run on the sustaining bar which is pivoted to and swings on the cross cleat of the main post.

Claim.—First, the bar B, pivoted on the cleat n, and having its rear end engaging with the hook b, as a support for the gate A, substantially as shown and described.

Second, mounting the gate A, on friction rollers arranged to run on the bar B, and having both gate and bar swing around, as set forth.

Third, the staples d, with the friction rollers mounted thereon, and said staples arranged to embrace the bar, as shown and described.

64,109.—ANTHONY ISKE, Lancaster, Pa.—*Sash Rope Plate.*—April 23, 1867.—An opening is made in the sash behind the plate to receive the knot of the

rope which is passed through the plate and then slipped upward in the slot.

Claim.—The specific arrangement of the plate A, with its circular opening B, slot C, groove D, and beveled convexity E, on the back, all arranged in the manner and for the purpose specified.

64,110.—PETER H. JACKSON, New York, N. Y.—*Boat Detaching Tackle.*—April 23, 1867.—The davit, links enter vertical sockets and are engaged by the ends of the right and left screw bolts, which are simultaneously retracted by rotation of the central nut.

Claim.—The cylinder g, feather i, lever k, and fork h, in combination with the bolts e e, having right and left-handed threads, said bolts taking eyes or rings on the ropes or chains passing to the davits, as set forth and for the purpose specified.

64,111.—JACOB L. KINTNER, Harrison, Ind.—*Hay Elevator.*—April 23, 1867.—The inclined toothed bars are operated by cranks, so that while one is at the highest point with the load, the other is loading and ready to ascend.

Claim.—The guide bars F F, having their lower ends connected to a curved plate, in combination with the rake G and bars A A, all constructed and operating in the manner and for the purpose set forth.

64,112.—D. P. LACEY, Oxfordville, Wis.—*Shower Bath.*—April 23, 1867.—By drawing the cord attached to the pivoted lever the valve is raised, disclosing a perforated section in the bottom.

Claim.—First, constructing and operating the valve substantially as and for the purpose set forth.

Second, the valve arrangement constructed as specified, in combination with a vessel for containing water, substantially as set forth.

64,113.—GORGES LIONEL LECLANCHÉ, Paris, France.—*Galvanic Battery.*—April 23, 1867.—The porous vase has a graphite plate to form the positive pole, and is filled up with a mixture of powdered graphite and peroxide of manganese. The enclosing jar has a plate of zinc and is filled with sand or sawdust moistened with a concentrated solution of chlorohydrate of ammonia. The cork has a central glass tube, and over this is a disk of rubber whose edges are secured to the wax, its middle slit forming a gas escape valve. The accumulator is composed of two jars containing each a plate of graphite, or other non-oxidizable substance, buried in powdered graphite moistened with a solution of potash.

Claim.—In combination the graphite plate or plates, the flask, and the porous vase, the flask and vase being charged and the whole apparatus being arranged to operate substantially as set forth.

Also, the employment in electrical piles of peroxide of manganese moistened with a liquid containing a salt in solution which has no chemical action on the peroxide of manganese, the salt used being capable by its electrolytical decomposition of rendering soluble the oxides of manganese arising from the reduction operated by the hydrogen.

64,114.—EDWARD S. LENOX and EDWARD SPAULDING.—New York, N. Y.—*Potato Digger.*—April 23, 1867.—The pivoted scoop has flaring wings to widen the track, and cutters and mold boards to displace the side earth laterally; the riddle following is driven by gearing from one of the supporting wheels. The scoop is supported in front by pivoted bars connected to the beam, with notched vertical bars and an adjustable lever. A caster wheel supports the front of the beam.

Claim.—First, the potato digger, consisting of the frame A, secured to the axle B, caster wheel D, suspended scoop E, with wings G G, curved bars h, riddle F, vibrated by suitable gearing N, cutter H, mold board I, toothed vertical bar i, chain k, and lever l, constructed and operating substantially as herein shown and described.

Second, the scoop E, when provided with a concave cutting edge to prevent the bursting of the hill, in combination with the wings G, as set forth.

Third, the vibrating riddle F, consisting of bent sheet metal bars, which are so arranged that the ends of the center bars drag on the ground, and those of other bars are elevated above the ground, substantially as and for the purpose herein shown and de-

scribed, in combination with the mold boards H and I, substantially as herein set forth.

Fourth, the mold boards H and I, when arranged as herein described, in combination with the wings G and scoop E, all made and operating substantially as and for the purpose herein shown and described.

Fifth, extending the sides or wings G, beyond the bottom of the scoop E, substantially as and for the purpose herein shown and described.

64,115.—M. LE PAGE and F. RAYMOND, Woodhaven, N. Y.—*Seat for Lounge Chair*.—April 23, 1867.—The rectangular frame has a rabbet, in which the arched springs are clamped by the strip, being further secured below by screws. An elastic longitudinal brace crosses each strip, and is riveted at its point of intersection with each.

Claim.—The strip C, curved on its profile in the arc of an ellipse, in combination with the rabbet a, curved in the arc of a circle, for clamping the ends of the spring B, substantially as and operating in the manner set forth.

64,116.—ELLIOT LEWIS, Lockport, N. Y.—*Sad Iron*.—April 23, 1867.—The feet of the removable handle slide forward beneath cross-bars in the slotted base, and are secured in position by a spring bolt in front.

Claim.—The detachable handle E, provided with feet g and slide bolt h, in combination with the way b, cross wires c c, and bolt socket d, arranged and operating substantially as set forth.

64,117.—WILLIAM E. LINCOLN, Providence, R. I., assignor to MILTON BRADLEY & Co., Springfield, Mass.—*Toy*.—April 23, 1867.—The cylinder has vertical sight apertures, and rotates horizontally. A series of figures are placed around within the cylinder, and by individually representing positions in a progressive series, convey the impression of action to the eye of the observer, as they are successively presented at a rate beyond the capacity of the organ to detect an interval in the succession.

Claim.—First, the device herein described, consisting of the revolving cylinder A, with any number of slits a b c d e, and having figures upon its inside surface, and arranged and constructed substantially as set forth.

Second, the plate F having any desired figures upon it, arranged in the manner and for the purpose described.

Third, the plate B upon the bottom of the cylinder having any desired figure or figures upon it, formed substantially in the manner and for the purpose set forth.

64,118.—WM. H. LIVINGSTON, Johnstown, N. Y.—*Hand Saw*.—April 23, 1867.—The rod is strengthened by a plate below, is bent and passes at a right angle through the handle, where it connects with the metallic tightening buckle, which engages both handle and saw.

Claim.—First, connecting the metallic back of a frame saw to the handle by passing the frame into a hole in the handle, substantially as specified.

Second, attaching the metallic tightening buckle d to the lower edge of the wooden handle a, in the manner set forth.

Third, a metallic tightening buckle, formed with a slot for the reception of the end of the saw, a hole for the screw rod i, and a nut to screw upon the rod e, as set forth.

Fourth, the stiffener plate c' and the rod e, forming the frame of the saw, as and for the purposes set forth.

64,119.—MICHAEL F. LOWTH and THOMAS J. HOWE, Owatonna, Minn.—*Cultivator*.—April 23, 1867.—The pivoted shovel beams are attached to an adjustable transverse bar connecting with grooved quadrants on the ends of a journaled shaft vibrated by a segmental lever.

Claim.—The combination with the quadrant J of the adjustable segment M, for the purpose of changing the position of the lever N, substantially as and for the object specified.

Second, the combination of the quadrants J J', segments M, shaft K and lever N, with the chains or flexible connections I, connecting bar H and shovel

beams D, all arranged and operating in the manner and for the purpose specified.

64,120.—JOHN LUNGER, Waldo, Ohio.—*Wagon Seat Supporter*.—April 23, 1867.—The standards straddle the side boards, and the outer leg slides within staples outside. The springs are bolted to the bow on the upper ends of the standards.

Claim.—The standard B, constructed substantially in the manner set forth, and used as and for the purpose specified.

64,121.—JOHN LYLE, Newark, N. J.—*Combination Tool*.—April 23, 1867.—The outer jaw in combination with two movable jaws constitute a punch on one side and pliers on the other.

Claim.—First, the U-shaped jaw A, in combination with two movable jaws B C and handles D E, constructed and operating substantially as and for the purpose described.

Second, the stop f, in combination with the U-shaped jaw A and movable jaws B C, constructed and operating substantially as and for the purpose set forth.

64,122.—ANDREW J. MAPES, Independence, Mo.—*Washing Machine*.—April 23, 1867.—The floating rubber board lies in the bottom of the box and has rollers in the middle actuated by the slats of the main wheel, which is geared to a smaller wheel above when churning. The wringer bag is attached to a bolt at one side of the machine, and passing over the small wheel to a crank at the other side, the moisture is ejected by twisting.

Claim.—First, the buoyant or floating rubber board B, constructed substantially as herein shown and described and for the purpose set forth.

Second, the combination of the large wheel C and small wheel E with each other and with the rubber board B, box A, and frame D of the machine, substantially as herein shown and described and for the purpose set forth.

Third, the combination of the long levers I, pitmans J, pulleys K and L, and bands M, with each other and with the wheels C and E and frame D of the machine, substantially as herein shown and described, and for the purpose set forth.

64,123.—THOS. J. MCGARRY, Cleveland, Ohio.—*Vessel for Storing and Transporting Oil*.—April 23, 1867.—The barrel-shaped tank has double walls, having a space between them filled with water, and is supported upon journals having bearings in the standards attached to the ear truck. The oil is discharged through an outlet in the bottom of the tank, which is closed by a valve attached to a rod.

Claim.—First, the tank A with shell and lining B, having a water chamber at the sides and ends, in combination with inlets and outlets, arranged as and for the purpose substantially as set forth.

Second, hanging the tank upon journals or bearings as and for the purpose set forth.

Third, the saddles N provided with spring bearings in combination with the tank, substantially as and for the purpose set forth.

64,124.—JAMES McLAUGHLIN, Duncannon, Pa.—*Railway Switch*.—April 23, 1867.—The shifting rails are not pivoted but allow movement by their flexibility. The meeting ends slide in a depression of the chair, and are attached together by a bolt traversing their longitudinal horizontal slots. These rails are kept asunder by brace rods.

Claim.—The movable elastic frog continuous with and forming part of the adjoining rails C C, their conveying slotted ends joined together in the slotted chair G by means of the bolt F, their elastic or disengaged portion connected together by means of the cross-rod d in combination with the main rails A A, branch rails B B, and operated by means of the crank e and sliding bar I, substantially as herein shown and described and for the purpose specified.

64,125.—SAMUEL MELSON, Erie, Pa.—*Paint Oil*.—April 23, 1867.—Composed of boiled linseed oil 22 galls.; benzine 16 galls.; rosin 56 lbs., and Japan drier 3 galls. White coppers or magnesia may be substituted for the Japan drier.

Claim.—The paint oil composed of linseed oil, ben-

zine, rosin, and the paint-dryer, in the proportions substantially as set forth, and prepared as described.

64,126.—BENJAMIN F. MILLER, New York, N. Y.—*Pavement.*—April 23, 1867.—The series of blocks lay at an angle of about 45° and distribute the weight and strain over a larger surface.

Claim.—A pavement formed of blocks laid at an inclination, so that one block lies partially upon the side of the next, substantially as set forth.

64,127.—CHARLES MILLER, St. Louis, Mo.—*Loom.*—April 23, 1867.—Antedated April 10, 1867.—The lay frame is actuated by a single crank on the end of a shaft running half way across the loom. The picker staffs are operated by stops upon a bar reciprocated endways by a cam wheel, each of the staffs coming in contact with its proper stop by the said movement of the bar. A vertically sliding post gives journal-bearing to a lantern frame, one of whose disks has a ratchet wheel on which a fixed pawl acts to rotate it by the vertical reciprocation of the frame. This reciprocation is effected by the oscillation of the lay frame. Bridge plates sliding on the rods are so adjusted as to come in contact when at their highest point with one of a series of studs, each connected to a set of harness to operate the same by the vertical movement of the frame.

Claim.—First, the combination of the short shaft B', the crank b, and rod b', when the whole are arranged in connection with the lay frame, in the manner and for the purpose described.

Second, the combination and arrangement of the shifting bar D and its stops d and the picking sticks C'.

Third, the ratchet E and its star-shaped groove e, for the purpose of giving the required motion to the shifting bar.

Fourth, the combination of the ratchet E and the lever E', substantially as described and for the purpose set forth.

Fifth, the combination and arrangement of the twill governor, composed of the devices F² F³ F⁴ F⁵ F⁶ f¹ f² f³ f⁴ f⁵ f⁶ and f', substantially as described and set forth.

64,128.—JOSEPH A. MILLER, New York, N. Y.—*Chimney or Ventilator.*—April 23, 1867.—The smoke stack has annular variously inclined planes, divided into radiating compartments, which catch the wind and increase the draft.

Claim.—The smoke stack A provided with annular inclined planes B C, having different inclinations, leaving a space divided into compartments by the radiating partitions D, constructed and operating as and for the purpose specified.

64,129.—A. J. MILLS and E. M. HEWETT, Scott, N. Y.—*Clothes Dryer.*—April 23, 1867.—The two series of slats are pivoted between metal plates which are bolted to a wall.

Claim.—The within-described dryer composed of the plate A' with its flanges and the pivoted slats B B, the same being used substantially as and for the purpose specified.

64,130.—GEO. M. MORRIS, Cohoes, N. Y.—*Oiling Device for Journal Box.*—April 23, 1867.—The revolving disk, which dips into the oil receptacle, is journaled in a removable plate and carries up oil to the shaft.

Claim.—First, forming inclined shoulders D and the oil chamber or reservoir C of the journal box, substantially as herein shown and described and for the purpose set forth.

Second, the inclined removable slotted plate E in combination with the inclined shoulders D of the journal box, and with the oiling disk F, substantially as herein shown and described and for the purpose set forth.

64,131.—FELIX MURRAY, Pittsburg, Pa.—*Apparatus for Rolling Clevises and Plow Shares.*—April 23, 1867.—The faces of the rolls are so recessed as to form blanks for the articles named.

Claim.—The rolling or forming of clevises and shares for plows by means of the rollers B B' provided respectively with the grooves a b c and d, and arranged with a stripping or guide roller D, to ope-

rate substantially in the manner as and for the purpose set forth.

64,132.—GEORGE H. MYERS, Philadelphia, Pa.—*Steam Engine Slide Valve.*—April 23, 1867.—The valve has a cavity at top containing packing of alternate rubber and prepared paper, having springs beneath forcing an upper plate against the valve cap, which is slotted to permit the traverse of a pin of the valve rod. This pin transfixes the slide plate and packing, and enters the valve to actuate the same.

Claim.—First, the cavity a in the top of the valve, in combination with springs d, packing piece b, and a top plate c, constructing and operating substantially as and for the purpose described.

Second, the slide c, working on the outside of the steam chest and provided with a pin f, to catch in a socket in the valve, in combination with the top plate c and packing piece b, constructed and operating substantially as and for the purpose set forth.

64,133.—J. H. NONAMAKER, Middletown, Pa.—*Farm Gate.*—April 23, 1867.—The rear of the gate has rollers whose grooves receive the edges of the fence boards, and the free end of the gate has a ground roller and enters a vertical groove of the gate post.

Claim.—The combination and arrangement of the grooved pulleys D and F with the rear end of the gate A, and with the rails E and G of the panel of the fence adjacent to the rear end of said gate, substantially as herein shown and described.

64,134.—R. J. NUNN, Savannah, Ga.—*Land Conveyance.*—April 23, 1867.—The curve-ended frame is supported on a series of grooved friction rollers running on an endless flexible band operated by a driving wheel, friction being enforced by two adjustable rollers above.

Claim.—The grooved rollers B and ribbed band C, in combination with the curved end frame A bearing the working parts, which communicate motion to the band, constructed and applied as described, for the purpose specified.

64,135.—ALFRED PARAF, Mulhouse, France.—*Copper-coated Iron Rolls for Printing and Finishing.*—April 23, 1867.—The turned and polished cast-iron roll is placed in an electro bath containing a copper solution and a copper plate. The solution consists of sulphite of soda, cyanide of potassium, acetate of copper, ammonia and water, and after certain described treatment the roll is treated with acid, washed and placed in a second electro bath of sulphate of copper, sulphate of soda, and sulphuric acid. The object is the deposition of a heavy coat of copper capable of being turned and polished.

Claim.—A new manufacture, marking, printing or finishing rollers of cast iron, and coating the same with copper, substantially in the manner and by the means herein specified.

64,136.—EPHRAIM PARKER, Marlow, N. H.—*Stove-pipe Damper.*—April 23, 1867.—The caloric current is driven circuitously by two adjustable disks operated and secured by a thumb screw with a spiral friction spring attached.

Claim.—A damper made of two parallel plates or disks whose edges are cut away at opposite sides, and to one of which is pivoted, hinged or adjusted near the side thus cut away a valve or slide, the whole device constructed so as to operate substantially as described.

64,137.—BENONI F. PARTRIDGE, Syracuse, N. Y.—*Quilting Frame.*—April 23, 1867.—The bars are secured to the rollers by set screws, and to the extension bars by guide straps. The extension bars act as legs, and are slotted and adjustable to suit the contraction of the quilt.

Claim.—The combination and arrangement of the axis, the rollers, the extension bars, the legs, the set screws, the guides, the stay rods, the slot in the extension bars, all constructed and operating substantially as and for the purpose shown and described.

64,138.—H. E. PASSMORE and G. A. HECKERT, York, Pa.—*Railroad Switch.*—April 23, 1867.—The switch rails are attached by their rear ends, so that

they will spring in position to form unbroken connection of the main track, but have sufficient pliability to shift by the passage of a train from the side track.

Claim.—First, the pointed spring rails C C, moving on the slide plates E E and lug plates F F, in combination with rails X X.

Second, the double-notched guard rails D D, in connection with the pointed spring rails C C, to guard the wheels from striking the points of the said spring rails X X.

Third, the single-lipped switch rod G, which allows the pointed spring rails C C to move back, in combination with spring rails, &c.

Fourth, the combination of the pointed spring rails C C, moving on the slide plates E E, the lug plates F F, and the single-lipped switch rod G, in connection with the guard rails D D, in the manner and for the purpose herein substantially set forth.

64,139.—NARCISSE PIGEON, Montreal, Canada.—*Manufacture of Starch Sugar.*—April 23, 1867.—The lead-line boiler has a supply at top, as also a pressure gauge, thermometer, and safety valve. Steam is admitted near the bottom by a lead pipe, which traverses the interior. To 40 lbs. of boiling water add gradually, maintaining the boiling heat, 1,000 lbs. of starch, acidulated with one per cent. of sulphuric acid diluted with water at 130° Fah. The contents are then raised to 300° Fah., then settled with 30 lbs. whitening and 40 lbs. bone dust. Evaporate to 21° Baumé and stand for the precipitation of sulphate of lime. The acid in the sirup is neutralized by hydrate of soda, and the saccharine solution condensed by further evaporation.

Claim.—First, the within-described process of manufacturing a crystallizable sirup from fecula, free from dextrine, or nearly so, substantially as herein set forth.

Second, the within-described process of manufacturing a hard crystallized sugar from starch sirup prepared from fecula, as above described, substantially as herein set forth.

64,140.—GEORGE M. D. POMEROY, Attica, Ind.—*Gate Latch.*—April 23, 1867.—When the bolt attached to the gate strikes the catch on the back of the latch, the latter rises in its slotted frame and falls again by its gravity.

Claim.—A gate latch consisting of the parts B C and D, constructed and arranged for use as described, acting in combination with the pin A, substantially in the manner and for the purpose set forth.

64,141.—WILLIAM PORTER, Sr., and WILLIAM PORTER, Jr., New York, N. Y.—*Lantern.*—April 23, 1867.—To attach the top and base together, two of the vertical guard wires pass through a horizontal flange of the base. One of them is secured by a lateral extension, and the other by a hook, which enters the eye at its end.

Claim.—The lower guard ring c, when made of sheet metal, as described, so as to permit of a prolongation of the guard wires, substantially as herein shown and set forth.

64,142.—W. S. POTWIN, Chicago, Ill., assignor to FRANK STURGES & Co., same place.—*Bottom for Culinary Steamers.*—April 23, 1867.—The bottom of the steamer has circular beads above for the contents to rest on, and a perforated groove below to drain off the moisture.

Claim.—The bottom of the steamer provided with the deep groove B, near its outer edge, projecting downward and surrounding the raised center, which is provided with the raised concentric ribs A, whereby perforated concentric channels are formed by the steam condensed within the steamer from the articles being steamed, as herein shown and described.

64,143.—JOHN B. RAINES, Fremont, Iowa.—*Corn Planter.*—April 23, 1867.—The cut-off and plate are beveled to prevent breaking the corn, and the dies are exchangeable to suit different sized grains.

Claim.—The cut-off represented in the drawings by the letters A A A and the dies represented by the letter J, and the bottom of the box in which the corn is placed, represented by the letters A A.

64,144.—JOHN H. RHODES, Brooklyn, N. Y.—*Valve Gear for Water Meter and other Purposes.*—April 23, 1867.—The devices mentioned in the claim are to avoid friction, and consequent injury in respect to the pin and other parts by giving the pin some play, and allowing the rapid flexion of the joint, after reaching the culminating point by the oval form of the lever end, against which the roller impinges.

Claim.—In a valve gear, substantially of the character described, the combination with rod H and its roller d of the lever E, linked as described to said rod by a pin f, arranged to pass through an oblong or oval slot in the lever, and the latter constructed at its outlet end i for gear with the roller d, substantially as specified.

64,145.—CELIUS E. RICHARDS, North Attleboro, Mass.—*Hat.*—April 23, 1867.—The paper twine is sewed together, assuming a shape to suit the taste.

Claim.—A hat fabricated of paper, thread, or twine, substantially as described, as a new manufacture.

64,146.—CHARLES RICHARDSON, Richmond, Va.—*Game for Pastime.*—April 23, 1867.—The board has a series of wells, deflectors, and pins, and the game is played by striking the balls with mallets against the deflectors, the balls on the rebound knocking down the pins without entering the wells.

Claim.—The arrangement of certain devices as hereinbefore described and shown by the accompanying drawings for forming an instructive and amusing game or pastime for the house or field.

64,147.—GEORGE RICHARDSON, Lowell, Mass.—*Let-off for Looms.*—April 23, 1867.—The yarn beam has a spur wheel engaging a pinion on the shaft of a friction pulley. The friction block is upon a lever having an adjustable spiral spring to regulate the tension. An arm upon the brake lever projects upward, and engages an arm of a rock bar, whose radial lip the yarn passes, and serves by its tension to regulate the pressure of the friction block.

Claim.—First, the combination and arrangement of the whip roll d, with its finger e, the lever f, tension spring h, friction pad m and friction pulley g, of any form or shape, substantially as and for the purpose herein set forth.

Second, the cam or pawl q, in combination with the adjustable stand p r and friction brake f, as and for the purpose herein described.

Third, allowing the let-off at the time of the extension of the sheds of the warp by its action on the whip roll, and completely stopping the let-off at the time of beating up the wool by means independent of the whip roll, substantially as herein specified.

64,148.—FRANCIS XAVIER RIZY, Monroe, Mich.—*Musical Rack or Desk.*—April 23, 1867.—The rack is adjustable in an inclined or horizontal direction by transverse bars, pivoted at their connections, and has a thumb screw to fasten it in position, and a foot ledge to support the music.

Claim.—The cross-bars G, in combination with the clamping bars e, the inclined plane h, thumb screw f, slots p, spurs o, enlargements n, and also in combination with the other common devices, such as the foot board d, rack c and instrument a.

64,149.—C. H. L. ROBERTS, Morrison, Ill.—*Churn.*—April 23, 1867.—The horizontal armed dasher is worked by the crank, which also works a shaft with spiral perforated flanges, turning in a trough; the latter receives the cream, and a small quantity of salt from funnels above, and passes the same to the chamber below.

Claim.—First, the arrangement of the shaft G, with its plates b b, and placed within the trough E, in the manner and for the purposes specified.

Second, the box A, with lid d¹, having funnels S t and covered opening x, dasher shaft D, in combination with the trough E, all arranged and operating in the manner substantially as and for the purpose set forth.

64,150.—ELIAS ROTH and GEORGE SHANE, New Oxford, Pa.—*Gate.*—April 23, 1867.—The upper hinge pintle is connected by a toggle joint to the post, and levers extending from the toggle plates have cords connected to posts up and down the road, by which

the gate is drawn up and bent over to release its fastening, and cause it to swing open.

Claim.—First, the combination and arrangement of the bent levers H and I, and short bars K and L, with the gate B, ropes O and N, post A, substantially as herein shown and described, and for the purpose set forth.

Second, placing a roller D under the front cross bar b^2 of the gate B, substantially as herein shown and described, and for the purpose set forth.

Third, the catch G E, constructed and arranged substantially as herein described and for the purpose set forth.

Fourth, forming the horizontal bars b^2 of the gate B, so that they may be oval in their cross section, and placing them with their longest diameter horizontal, substantially as herein shown and described, and for the purpose set forth.

64,151.—W. RUSSELL and B. CARPENTER, Northfield, Ohio, and JOSEPH DRAKE, Boston, Ohio.—*Compound for Curing Foot Rot in Sheep.*—April 23, 1867.—The gland in the heel is dissected out, and the wound treated with a compound of sulphuric acid, $\frac{1}{2}$ oz.; pine tar, $\frac{1}{2}$ oz.; common salt, $\frac{1}{2}$ oz.; and turpentine, $\frac{1}{2}$ oz.

Claim.—The herein described compound, applied as and for the purpose described.

64,152.—E. SEXTON, Munson, Mass.—*Gang Plow.*—April 23, 1867.—The plow beams have flattened bars at each end passing up through sleeves attached to the transversely adjustable longitudinal bars of the frame, and the plows are vertically adjusted by pins passing through these bars. Other bars from the plow beams pass up to levers above the frame by which the plow may be raised from the ground.

Claim.—First, the adjustable bars B, provided with the tubular guides or supports F for supporting the plows, substantially as shown.

Second, in combination with the laterally adjustable bars B, the spring rods l and levers L and m , arranged to operate as set forth.

64,153.—CHARLES SEYMOUR, La Porte, Ind.—*Gate Fastening.*—April 23, 1867.—The sliding catch piece is raised by the side levers. It is held down on the pin by the disk at top, which has a socket to allow its passage in one position.

Claim.—The bed plate C, cap A, sliding bar B, thumb series D D, and circular sock E, constructed, arranged and operating substantially as herein set forth.

64,154.—BENJAMIN F. SHAW, South Danvers, Mass.—*Machine Knitted Hosiery.*—April 23, 1867.—The continuous knitted tube has projections which are bent around to form the heel and toe.

Claim.—As a new article of manufacture, a machine-made stocking, hose, or sock, knit or formed in the manner set forth.

64,155.—GERARD SICKELS, Boston, Mass.—*Shoe Fastening.*—April 23, 1867.—The plate through or around which the lacing passes is rotated to take up the slack of the lacing and is then secured by the sliding catch.

Claim.—A shoe fastening device constructed to operate substantially as set forth.

64,156.—WARREN A. SIMONDS, Boston, Mass.—*Apparatus for Carburetted Gas.*—April 23, 1867.—The vessel is divided by horizontal diaphragms into a vertical series of chambers, each of which has a vertical diametric partition running across. U-pipes connect with the upper and under chambers respectively so as to form overflows and air passages from chamber to chamber. The apparatus is filled from the top.

Claim.—First, the arrangement within the vaporizing vessel of complete disks f and partial partitions g , when combined with tubes h , connecting the respective cells of each chamber alternately with a cell of the chamber above and with a cell of the chamber below, substantially as and for the purpose described.

Second, connecting the cells on different sides of the same disk by independent U-tubes exterior to the cylinder, adjusted, arranged, applied, and operating substantially as described.

64,157.—PHILIP SINZ, Baltimore, Md.—*Mounting Glaziers' Diamonds.*—April 23, 1867.—The diamond block and the breaker are folded against the side of the handle. A spring holds them in either position.

Claim.—The within described glaziers' diamond, the same having the breaker B joined or pivoted to the handle A, and the diamond block swiveled to the breaker, substantially as and for the purpose set forth.

64,158.—CHARLES T. SMITH, Utica, N. Y.—*Metallic Bobbin.*—April 23, 1867.—Improvement on his patent October 16, 1866. The wooden heads are engaged between a shoulder of the metal and the expanded end of the same.

Claim.—The securing of the wooden heads or flanges b on the non-corrosive metal tubes a of bobbins by drawing up a shoulder c on the tubes for the upper surfaces of the heads or flanges b to abut against, and turning up the ends of the tubes a within a concave d , substantially as shown and described.

64,159.—HENRY SMITH, JR., Summit, N. Y.—*Coffin.*—April 23, 1867.—The frame which is prepared for the reception of the glass is flush with the cover of the coffin.

Claim.—The combination of the frame C prepared for the reception of a glass plate with the cover B of the coffin in such a manner that the upper side of said frame may be flush with the upper surface of the said cover, substantially as and for the purpose herein set forth.

64,160.—JOHN A. SMITH, Salem, Mass., assignor to himself and A. S. HODGES, Southboro, Mass.—*Sash Fastener.*—April 23, 1867.—The cam is pivoted in the shell which is attached to the stile and acts against the metal facing of a wooden friction block to sustain or fasten the window.

Claim.—First, the combination with the shell D, cast as described, of the cam lever E and metal faced block f , substantially as and for the purposes set forth.

Second, the combination with the shell D of the pivot a cast upon the inside of the block of shell D, for the purpose stated.

64,161.—S. B. SMITH and E. LINDSLEY, Cleveland, Ohio.—*Pantaloons Guard.*—April 23, 1867.—The metallic band fits the bottom of the trousers leg and is secured by buttons stitched to the trousers, the tongues of the buttons entering slots of the band.

Claim.—The metallic guard A constructed substantially as described, in combination with the hooked buttons C, in the manner and for the purpose set forth.

64,162.—SEABURY SOWLE, New Albany, Ind.—*Skid.*—April 23, 1867.—The curved parallel track has hooks at one end for engagement to an upper hatchway and is constructed of several series of overlying strips.

Claim.—The skid herein described, when composed and constructed as described, with its curved center, and connected by the hooks in the manner and for the purposes set forth.

64,163.—A. B. SPROUT, Hughesville, Pa.—*Horse Hay Fork.*—April 23, 1867.—The two bars are pivoted together like shears. The lower ends of the bars are conform and have cutting edges and shoulders. When closed the fork will cut its way down into the hay, and when opened the shoulders are exposed to hold the hay while the load is lifted.

Claim.—The conform points f and g provided with cutting edges and shoulders or hooks 6 and 7, constructed, arranged, and operating substantially as herein described and for the purpose set forth.

64,164.—OLE O. STORLE, North Cape, Wis., assignor to himself and PERCY B. SMITH, Milwaukee, Wis.—*Horse Hay Fork.*—April 23, 1867.—The connecting rods connect the tines below with the sleeve above, which, slipping on the central shafts, adjusts the tines for entering or retaining the hay. A pivoted lock hook fits into notches in the shaft and is attachable to the cross-bar above to maintain the tines in either position.

Claim.—A horse hay fork when made with prongs A, connecting rods B, sleeve C, shaft D, and lock E, in combination substantially as and for the purpose described.

64,165.—J. E. TATE, Columbia, Tenn.—*Cultivator*.—April 23, 1867.—The forward teeth and the scrapers are adjustable to leave a wider or narrower row. The clevis hook is on one side to enable the horse to walk beside the row. The coverer is a transverse bar of wood concave beneath.

Claim.—First, the adjustable scrapers F constructed as herein shown and described, in combination with the bars G and frame A of the cultivator, substantially as and for the purpose set forth.

Second, the cotton coverer L, constructed as herein shown and described, in combination with the bars F and frame A of the cultivator, substantially as and for the purpose set forth.

64,166.—JAMES EDWARD THORPE, Erie, Pa., assignor to himself and W. J. F. LIDDELL, same place.—*Steam Pump*.—April 23, 1867.—The valve is operated by tappets on its rod engaged by an arm from the piston rod. The action is direct, the steam piston rod carrying the pump piston. The sleeve on this rod has two downwardly-projecting plates, which engage a crank on the fly-wheel shaft. A disk on this shaft has a wrist pin working in a vertical slot of a slide plate connected to the piston rod of the supply cylinder, which communicates with the pumping cylinder and regulates its connection with the water ports.

Claim.—The supply cylinder D, constructed and operating substantially as described, in combination with the pumping engine and the oscillating valve F and chamber E.

Also, the arrangement, substantially as described, for moving the steam valve and the piston of the supply chamber.

64,167.—WILLIAM H. T. TOMLIN, Mullica Hill, N. J.—*Horse Hay Fork*.—April 23, 1867.—The adjusting rope runs over a pulley in the standard, and is attached to the toggle joint lever, which works in the slotted standard and actuates the pivoted forks. The fork is elevated by block and tackle attached to the clevis on the end of the standard.

Claim.—A hay elevator consisting of the two forks C, hinged to the cross-bars c and connected by the toggle joint lever f g, having the loop or guide o working in the vertical groove t of the slotted standard A, substantially as shown and described.

64,168.—ISRAEL D. VANDECAR, Chicago, Ill.—*Excavator*.—April 23, 1867.—The four shovels are arranged in pairs, open and closing toward and from each other, having shanks which enter recesses in the lower end of the vertical post, and are vibrated by levers operated by chains.

Claim.—First, the combination and arrangement of the shovels B, provided with the shanks B', the levers C, arms a, and the post A, when arranged and operating substantially as described.

Second, in combination with the shovels B, provided with the shanks B', the levers C, arms a, and post or center piece A, the connecting chains D, hoisting rope E', and dumping ropes E, when all arranged and operating substantially as and for the purposes set forth.

64,169.—ISRAEL D. VANDECAR, Chicago, Ill.—*Dredging Machine*.—April 23, 1867.—The scoops are firmly attached to the end of the handles, which are pivoted like shears, and operated by drawing upon the central rod to close them, or by the divaricated chain to open them.

Claim.—First, the combination and arrangement of the scoops C D, handles or levers E F, connecting chains B, rod R, hoisting rope H, and plate A, when constructed and operating substantially as and for the purposes specified.

Second, in combination with said scoops, handles or levers, connecting chains, rod, hoisting rope, and plate, the ropes or chains G, when operating substantially as and for the purposes set forth.

Third, the combination and arrangement of the plate A, rod R, provided with the shoulder r, the catch plates a, bent lever d f, and cord g, when constructed and operated substantially as herein specified.

64,170.—B. VAN GAASBEEK, Mount Vernon, N. Y.—*Ironing Table*.—April 23, 1867.—The hinged side pieces when opened disclose the ironing boards, which

open out on pivoted joints; hinged legs adjusted by a spring support the other ends.

Claim.—The combination of the chamber d of the table, the pivoted ironing board, and the folding leg f, substantially as and for the purpose herein set forth.

64,171.—W. F. VEBER, Perrysburg, Ohio.—*Fence Gate*.—April 23, 1867.—When the button is lifted, the notch on the top bar is lifted from the bolt and the gate is slipped on the roller attached to the forward post, till it is disengaged from the other post and it is swung round.

Claim.—The gate A, as constructed in combination with the joints or pivoted post G, as and for the purpose set forth.

64,172.—JOSEPH S. WATERMAN, Roxbury, Mass.—*Corse Preserving Case*.—April 23, 1867.—The ice chamber is above the chamber enclosing the body, and there is free circulation between the two. The sides of the ice chamber are flexible so that as the ice melts, the top of the chamber settles.

Claim.—Providing the ice chamber B with a yielding top or cover, for the purpose set forth.

Also, forming a passage from the corpse chamber to an ice chamber placed above it, substantially as and for the purpose specified.

64,173.—N. WATERMAN, Toledo, Ohio.—*Folding Chair*.—April 23, 1867.—The legs are pivoted together at their point of junction and in front to the seat, which is hooked to a roller in the back. By detaching the hook it can be folded for removal.

Claim.—The combination of the seat G and legs B D, whereby the back legs D fold on the front legs B and the seat G, passing through between the side pieces C, above the round I, fold on the hind legs D of the chair, substantially as described, for the purpose specified.

64,174.—DAVID C. WATSON, Manchester, N. H.—*Check Rein Holder*.—April 23, 1867.—A spring sleeve rising upon a vertical stem in the saddle acts as a mousing to the rein hook to prevent the accidental disengagement of the rein.

Claim.—The mode herein described to secure check reins in the hook, as shown, by stem C, pin D, tube B, tube A, and spring E, which may be made of wire or rubber.

64,175.—DEXTER P. WEBSTER and HERMON W. LADD, Philadelphia, Pa.—*Spring Bed Bottom*.—April 23, 1867.—The detachable bottom is suspended by hooks attached to the frame; metallic sockets secured to the side bars retain the dovetailed cross-slats, to which transverse longitudinal strips are attached.

Claim.—First, the detachable frame herein described, the same consisting of the side pieces B, with dovetail brackets C, and the cross-pieces D, with dovetail ends, constructed and operating substantially as and for the purpose specified.

Second, the plates C, constructed as described, in combination with the cross-pieces D, substantially as and for the purpose specified.

Third, the removable sectional tubular cushions G, applied to the coils of the springs, substantially as described, for the purpose specified.

Fourth, the pendant hooks a, constructed as described, in connection with the bedstead frame A, supporting the slat-bearing frame, substantially as described, for the purpose specified.

64,176.—MORRIS WELLS, Williamsburg, N. Y.—*Machine for Shaping Metals*.—April 23, 1867.—The die and its bed plate are raised against the clamp and plunger, the clamp being secured to a cross-plate which bears against adjustable springs. The die is secured to a cross-head, reciprocated by link attachment to a crank on the same shaft which carries the eccentrics giving the motion to the die.

Claim.—First, the combination of springs d with the cross-bar supporting the clamp G, substantially as and for the purpose described.

Second, the link K, fitted closely between the cross-head J, and crank L, and operating in combination with the die F, and punch I, substantially as and for the purpose set forth.

64,177.—NATHANIEL T. WHITING, Lawrence, Mass.—*Sleigh*.—April 23, 1867.—The hollow cross-bar is placed between the runner and the knees to more nearly connect the draft and load. The groove and pin in the cross-bar prevent the turning of the extension bar in backing. The draft hooks are slotted to hold the springs which secure the shaft.

Claim.—First, the combination of the hollow cross bar A, the slotted slide B, and pin E, when constructed and arranged to operate substantially as and for the purpose set forth.

Second, the combination of the slotted shaft iron F, the springs C, and slotted hooks $a^1 a^2$, when arranged to operate substantially as and for the purpose set forth.

64,178.—JOHN WICKS, Greenland, Wis.—*Ore Washer*.—April 23, 1867.—The separator is connected with a slime pit and with the pans by pipes. The larger particles of the ore are retained in the sieves and the finer pass through into the hutch, and from thence into the buddle. The sand and poor ores are washed out of the sieve into the trough by the motion given to the water in the hutch, by means of the plunger attached to the walking beam.

Claim.—First, the combination of the separator B, slime pit J, buddle H, and their connections, the sieves $c c c c$, and hutch K, all for the purposes and substantially as described.

Second, the walking beam N, connecting rod 3, in combination with the hutch K, substantially as described.

Third, the buddle H, in combination with the slime pit J, for the purposes described.

Fourth, the buddle G, in combination with the hutch K, substantially as described.

64,179.—JAMES C. WHITTINGTON, Brookline, Mass.—*Illusory Decapitation*.—The false head is substituted within the hood in the place of the real one of the person who stoops within the effigy while the decapitation is performed.

Claim.—The effigy composed of figures 1 and 2, constructed and arranged substantially as herein shown and described for the purposes specified.

64,180.—JOHN YOUNG, Amsterdam, N. Y.—*Clothes Wringer*.—April 23, 1867.—The upper gear rotates upon a stud which allows it freedom of motion to accommodate it to the rise of the upper roller; the cross-bar in the end of the roller shaft engages in the slotted boss on the pinion.

Claim.—First, the gear F, when applied to the upper shaft B of clothes wringers, in the manner herein shown and described, and operating as set forth.

Second, in combination with the gear F, the cone or center g and pin d , arranged as described, when used in connection with a gear c , as specified.

64,181.—HELEM MERRILL, Brooklyn, N. Y.—*Sprinkling Liquids in Refining Sugar*.—April 23, 1867.—A current of steam or air charged with water in the form of spray is directed against the interior surface of the layer of sugar in the centrifugal filter.

Claim.—Diffusing the water or other cleansing or bleaching agent in a finely divided state by means of a current of air or other elastic fluid, substantially as described.

64,182.—HELEM MERRILL, Brooklyn, N. Y.—*Discharger for Centrifugal Machine*.—April 23, 1867.—The sections are hung on the arms of shafts which are carried on the triangular frame, resting on bolts. These sections serve to collect the sugar from the inner side of the sieve, and may be removed together or separately and empty one attached.

Claim.—The stationary and removal scrapers and receptacles, by which a centrifugal machine may be discharged when in motion, substantially as described.

64,183.—HELEM MERRILL, Brooklyn, N. Y.—*Feeder for Centrifugal Machines*.—April 23, 1867.—The partially granulated mass is evenly spread on the sieve by a curved plate on the side of the hopper.

Claim.—A hopper constructed substantially as described for the purpose of delivering and distributing a uniform layer on the sieve of a centrifugal machine while in motion.

64,184.—MONROE STANNARD, Hartford, Conn.—*Sewing Machine*.—April 23, 1867.—Explained by the claims and illustration.

Claim.—First, operating the feed wheel of a sewing machine by means substantially such as described, so that whilst it shall always, when in action, have the ordinary intermittent motion, it may, in addition, have or not have, at the option of the operator, a positive rising or falling motion for each progressive action of the wheel, for the purpose set forth.

Second, the employment in a sewing machine of the adjustable vibrating lever N, or its mechanical equivalent, with the rock shaft P, arms $q s$, connecting bar r , cam t , or their mechanical equivalents, for holding the feed wheel, and for giving to it an alternate rising and falling movement, substantially as described.

64,185.—JOSEPH B. ALEXANDER, Washington, D. C., assignor to himself and Wm. H. FREER, same place.—*Railroad Switch*.—April 30, 1867.—The switch is moved by an oscillating plate which is acted on by a roller attached to the locomotive, or in case of street cars by a wheel flange.

Claim.—The construction and arrangement of the switch rails C G and C' G', with the arms or the wings of a plate of iron or wood turning on a central fulcrum in such a manner as to oscillate and open one track while it closes the other, as described and for the purpose set forth.

Also, the anchor-shaped cam K, with the wings L and L', and the friction roller M, as described and for the purpose set forth.

Also, in combination with the above, depressing rails E and E', so constructed and arranged as to be operated upon by the shifting roller or wheel c , attached to the locomotive engine, as described and for the purpose set forth.

64,186.—A. C. BABCOCK and JOHN DUFFY, New Haven, Conn.—*Carriage Curtain Fixture*.—April 30, 1867.—The blind is arranged to be drawn up by a spiral spring, which is retracted by drawing down the blind, and the rotation of the roller is prevented by a rubber pad upon a metallic spring, which comes in contact with the roughened plate at the roller end.

Claim.—First, the plate E, in combination with a spring F, when constructed and arranged so that the said spring bears upon the surface of the plate E, as and for the purpose specified.

Second, the spring F, attached to the stud D, so as to form the handle G, substantially as and for the purpose specified.

Third, in combination with D plate and spring F the stop d , in the manner specified.

64,187.—GEORGE H. BAILEY, Jersey City, N. J.—*Machine for Making Water, Gas, and Other Pipes*.—April 30, 1867.—The plunger works within a metallic pipe having one end closed to more forcibly compact the cement. It displaces the cement in front, causing it to adhere to the pipe. Lifting rods raise the collar when the plunger is raised.

Claim.—First, the employment, in the manufacture of pipes composed in whole or in part of cement or plastic material, of a plunger either movable or stationary, which is shaped substantially as set forth, either with or without spiral cutters, and which, by the application of power or by its own weight and momentum, displaces the cement in front of it, causing the latter to adhere to the pipe, and rendering it solid and compact, substantially as described.

Second, the combination with the plunger D of the top and bottom collars C C', with vent holes for the admission and escape of air, substantially as described.

Third, the application of lifting rods $g g$ to the collar C for lifting this collar when the plunger is raised, substantially as described.

Fourth, a plunger working within a metallic pipe or mold, having one or both ends closed, so as to more perfectly and forcibly compact the cement or plastic material within it, substantially as described.

64,188.—ARTHUR BARBAEIN, New Orleans, La.—*Lighting Gas*.—April 30, 1867.—A small cylinder containing spongy platinum is attached to a gas burner, which throws a stream of gas thereon to ignite the same. A mixture of pure and carburetted hydrogen is first passed through the pipe, and after ignition the flow of the former is stopped.

Claim.—First, the direct use and application of spongy or finely divided platinum (without extra pipe for conveying the hydrogen gas upon the same) to an ordinary gas burner in any manner that shall cause the platinum to be directly in the path of hydrogen or hydro-carbon gas, when issuing through such ordinary burner, whether these gases be separate from each other or mixed together, whether the burners have additional jets or not, and whether the platinum be used and applied permanently or temporarily to said burners, for the purpose set forth.

Second, the lighting of hydrogen or hydro-carbon gas, whether separate or mixed, by means of spongy or finely divided platinum placed on a gas burner as herein specified, whether the said platinum be temporarily or permanently attached to the burner, or whether it be temporarily applied in any other way to hydrogen or hydro-carbon gases, either separate or in a mixed state, when issuing from a burner.

Third, the use of the same pipes and branches as herein described, for the purpose of conveying the gases, whether they are mixed or separate, to the burners, for the purpose set forth.

Fourth, conveying the gases, in a separate or mixed state, or one before the other, through the same pipe and branches as described, for the purpose set forth.

64,189.—HENRY D. BIRD, Petersburg, Va.—*Compound for Cleansing the Human Body from Offensive Odors.*—April 30, 1867.—A deodorizer for the human skin. Composed of chloride of lime, 75; chloride of ammonia, 20; bichromate of potash, 5 parts; to be mixed in saturated solution and perfume added.

Claim.—A compound for cleaning the surface of the human body, substantially as herein set forth.

64,190.—DANIEL BORDNER, Canton, Ohio.—*Gate.*—April 30, 1867.—The gate is opened by the weight of the carriage, actuated by levers and shafts, the sliding rod to which the extension bar of the gate is connected by a chain.

Claim.—The peculiar arrangement of the levers K and L in shaft S, acting on the bar N, through the iron M, the said bar N having the cord I attached to it and to the end W of the upper bar A of the gate, the several parts operating in the manner and for the purpose specified.

64,191.—HENRY L. BUDD, New York, N. Y.—*Gate Bar.*—April 30, 1867.—The interlocked cross-bars rest on a transverse longitudinal bar, which being partially sheltered from the heat is less liable to warp.

Claim.—A furnace grate bar formed of a series of sections *b* attached to the longitudinal bar *a*, said sections interlocking, and constructed substantially as specified.

64,192.—JAMES BUDD, Pittsford, N. Y., assignor to BUDD and BRIGGS.—*Well Pipe.*—April 30, 1867.—The double-flanged point is attached to the pipe by a perforated coupling joint, and has a perforated chamber within. Flanged collars surround the pipe at intervals to stay the passage of quicksand. The tubing is driven into the ground by a steel rod, which passes through the pipe to the point below.

Claim.—The combination and arrangement of tubes *f o*, the flanged collar *n* and flanged point *a*, the whole substantially as and for the purpose set forth.

64,193.—JAMES BUDD, Pittsford, N. Y., assignor to BUDD and BRIGGS.—*Gate.*—April 30, 1867.—The double suspension gate running on sheaves is operated by toggle levers from a horizontal shaft; the latter is supported by the frame, and by the arms of detached posts, and is oscillated by levers and cords.

Claim.—The combination of the double action lever *a*, with the levers *b* and double action levers *d d*, horizontal bar *c*, strips *e e e e* and *f f*, guiding boards *i* and *h*, also posts *u m*, with arms *r r*, the whole operating substantially in the manner described and for the purpose set forth.

64,194.—THOMAS B. BURTIS, Chicago, Ill.—*Gas Condenser, Scrubber, and Washer.*—April 30, 1867.—The gas passes through a series of long, narrow boxes, with corrugated sides, and the washing fluid is introduced therein in jets. The surfaces of the boxes are cooled by water, which circulates in spaces between

them. The gas to be cleansed enters through the outer pipe, and escapes through the inner one.

Claim.—First, the lengthy and narrow boxes D, the water vessels D² above the same, and the water spaces E between the same, substantially as and for the purposes set forth.

Second, the method of applying the water to condense, scrub, and wash the gas, substantially as set forth.

Third, the combination of the vessels D², the overflow pipes *k*, water pipe *K*, service pipes *l* and water chambers M, as and for the purposes set forth.

Fourth, the application of the jet chamber M, as and for the purposes set forth.

Fifth, the application of obstruction pieces extending from top to bottom of the boxes D, substantially as and for the purposes set forth.

Sixth, the arrangement and combination of the pipes F and G, *f* and *g*, with their stop cocks, valves, and the boxes *d d*² and *d*², as and for the purposes set forth.

64,195.—WILLIAM B. BURNETT, New York, N. Y.—*Brush Block.*—April 30, 1867.—The head block is beveled that the bristles may brace against each other, and a strip of wood of transverse grain is inserted in a slot through the middle to prevent warping.

Claim.—A whitewash brush block, which is constructed with a strip of wood, which is harder than the wood of which the block is made, inserted into a kerf in its lower edge, so that the grain of the strip shall run at right angles to the grain of the block, as herein described and shown, thereby producing a new and improved article of manufacture.

64,196.—WALDRON J. CHEYNEY, Wallingford, Pa.—*Manufacture of Porcelain.*—April 30, 1867; antedated March 29, 1867.—Explained by the claims.

Claim.—First, the use of the minerals known as cryolite and chiolite, or their equivalents, in combination with silica, for the purpose of producing a vitreous porcelain, substantially as described.

Second, the fusing of either of the before-named minerals or fluellite or their equivalents with silica, in combination with soda, potash, lime, or other alkali or oxide, substantially as described.

Third, a new article of manufacture made by fusing silica with the above-named minerals or their equivalents, which I call "hot-cast porcelain."

64,197.—SPENCER M. CLARK, Washington, D. C., assignor to JOHN Q. LARMAN.—*Machine for Punching Paper.*—April 30, 1867.—The punch is secured in and surrounded by a clamp, which slides in the sleeve, being actuated by a lever hung in brackets on the gooseneck, and worked by a treadle on its lower end. The punches and clamps are withdrawn automatically by the springs, when the holes have been cut.

Claim.—First, the combination with the punches and surrounding clamps and the springs of the screw bolts and rods for adjusting the tension of said springs, and for effecting the combined movement of the clamp and punches, substantially in the manner herein specified.

Second, the combination with the clamp and connecting screw rods or bolts of the sliding cross head, punches, and surrounding springs, under the arrangement and for operation as herein set forth and described.

64,198.—Z. ERASTUS COFFIN, Boston, Mass.—*Stop Cock.*—April 30, 1867.—The valve is operated by two screw rods having bevel gear wheels connected together, so as to insure equal movement of both sides.

Claim.—The taper valve operated by connected screws and moving on continuous guides, arranged within the shell or body or a stop cock, substantially as described.

64,199.—Z. ERASTUS COFFIN, Boston, Mass.—*Valve for Stop Cock.*—April 30, 1867.—The two faces of the valve are pivoted together to allow accommodation to their faces. The stem has a slight vertical movement separately from the valve, so as to cause additional pressure against the inclines on their inner sides, after having come to their seats; this arrange-

ment operates to lessen the friction on retraction of the valve.

Claim.—First, the valve made in two parts, each bearing a face, and so jointed with reference to each other and to the mover as to render them self-adjusting to the angles of the seat, substantially as described.

Second, giving the mover a movement independent of the movement of the valve, so as to relieve the pressure by means substantially as described.

64,200.—A. COREY and J. M. HARPER, Philadelphia, Pa.—*Type Setting Machine.*—April 30, 1867.—The machine sets the type in rows and collects the rows together. On depressing the appropriate key the type is pushed horizontally from its reservoir on to a table on which it is lightly pressed during its movement. When free it is turned against an arresting and guiding plate along which it is pushed beneath a pile of types previously operated on. The row having reached a length equal to the width of the page, is pushed against similar rows previously composed.

Claim.—First, the loose wheel *d* or its equivalent, so arranged as to bear on the type as it is being pushed from beneath the reservoir.

Second, the reciprocating bar *I*, so constructed at the end and so combined with the arresting and guiding plate *J*, as to turn the type in the manner described.

Third, the combination of the said guiding plate *J*, the pushing bar and the shoulder *j* on the latter.

Fourth, the combination with the pushing bar of a plate *z* with a straight edge *x*, so arranged and operating as to adjust the row of type in line.

Fifth, the setting of a vertical row of type by introducing type after type to the said row, substantially in the manner described.

Sixth, beneath the vertical row of type a block or plate *T* or its equivalent, so rounded or otherwise formed that on pushing a type to its place beneath the row it will be the means of elevating the same, as described.

Seventh, the plate *g* arranged as shown, so that the row of set type will not be disturbed by the introduction of a new type to the row.

Eighth, the pressure plate *w*, arranged in respect to the plate *g*, for the steadying of the vertical row of the type, substantially as described.

Ninth, the combination substantially as described of the plates *N* and *g* and rods *S* and *S'*, for confining and guiding the vertical row of type.

Tenth, the bar *g* so connected to the machine and to a suitable operating device, that it can be moved at pleasure away from the front edge of the row of the type, when the same has to be inspected.

Eleventh, the combination of the plate *N*, the rods *S* and *S'*, and the mechanism herein described, or the equivalent to the same, whereby the rods are caused to recede from each other and make way for the row of type prior to the same being pushed back by the said plate *N*.

Twelfth, the box or case *M*, in combination with the detachable type receiver *5*.

Thirteenth, the mechanism described or its equivalent for causing the block *Y'* to recede prior to a new row being pushed toward a previously formed one.

Fourteenth, the combination of the pressure plate *Z* with the type-receiving case and sliding block *Y'*.

Fifteenth, the spring plate *F*, Fig. 2, arranged and operating for controlling the whole of the keys, substantially in the manner described.

64,201.—C. W. CORR, Carlisle, Ill.—*Wheelwright's Machine.*—April 30, 1867.—The machine includes devices for driving the spoke into the hub, cutting the spoke to its length and tenoning it, boring the fellos and turning them true after being put upon the spokes.

Claim.—First, the adjustable frames *O* and *B* and the shaft *M* with the hinged support *E*, when the said several parts are arranged to operate as and for the purposes set forth.

Second, the hammer *D* arranged to be operated by the spring *f* and lever *I*, together with the means of regulating the force of its blow at will, as shown and described.

Third, the combined sawing and tenoning tool, constructed substantially as described.

Fourth, the frames *J* and *K* arranged to move in

the arc of a circle, the center of which shall be coincident with the center of the shaft supporting the hub, for the purpose of adjusting the sawing and tenoning tool to work on a wheel having any number of spokes, as herein described.

Fifth, so mounting the tool *o'* that it shall have a lateral movement for saving off the end of the spoke, and also a longitudinal movement for forming the tenon on the spoke, substantially as set forth.

Sixth, the tool *P* for supporting and holding the spoke while being driven, as described.

64,202.—JOSEPH E. CRISP, Charlestown, Mass.—*Rivet Machine.*—April 30, 1867.—The wire is fed into the forming sockets of a rotating disk and automatically cut. The rivet is finished by opposite simultaneously acting dies, and is expelled from the socket by a plunger.

Claim.—First, the combination of the intermittently revolving die disk *G* with the plungers *J* and *K*, arranged and operating as described.

Second, in combination with the subject-matter of the first claim the plunger *P*.

Third, in combination with the plungers *J* and *K*, the series of cams on the face of the wheel *L* and the hammer *m*.

Fourth, in combination with the intermittent revolving die disk *G*, the plungers *J* and *K* and *P*, and the stubs on the periphery of the wheel *L*.

64,203.—JAMES HENRY CULVER, San Francisco, Cal., assignor to himself and CORNELIUS LEONARD.—*Calipers.*—April 30, 1867.—The usual inside and outside calipers have one of their legs jointed on a thumb screw.

Claim.—A pair of calipers either for inside or outside measuring, constructed with the joint *C* and shoulder *b* and *c*, substantially as and for the purpose set forth.

64,204.—JONATHAN DEARBORN, Seabrook, N. H.—*Mechanical Telegraph.*—April 30, 1867.—The bell cranks stand at angles of 120° with each other; the cranks of one shaft are connected by rods with those of the other. Endless chains with lettered links pass around the wheels, correspondence being maintained between the two; one being actuated by an operator to bring given letters in series to a fixed point, the corresponding letters are brought by synchronous action to analogous position on the other to be viewed by the observer at that point.

Claim.—The combination and arrangement of the six bell cranks and the three connecting rods with the two shafts, and also with the two telegraphic endless chains and their sprocket wheels, applied together and constructed substantially in manner and so as to operate as specified.

Also, the combination and arrangement of the two serrated racks *H* *I*, connected by a chain going around a pulley as described, with the sprocket wheel *K*, the connecting rods *o o*, and bell cranks *m n*, applied to a rotary shaft, as set forth.

64,205.—WM. A. DEITZ, Albany, N. Y.—*Shoe.*—April 30, 1867.—The flap opens rearward and forms the back part of the shoe above the stiffening.

Claim.—The method of constructing boots by making the opening for the introduction of the foot in the back, and covering the opening with a tongue on the inside, with a flap extending around the side of the boot, secured to the same in the manner and for the purposes set forth.

64,206.—D. A. DICKINSON, Baltimore, Md.—*Machine for Husking Corn.*—April 30, 1867.—The pulley faces on the shafts are eccentric, alternately in opposite directions, and between these surfaces pins assist in tearing the husks.

Claim.—The arrangement of the shafts, having pulleys placed eccentrically, and belts, substantially as and for the purpose herein recited.

Also, in combination with the pulleys, or their equivalents, the teeth *g*, for the purpose herein set forth.

64,207.—NOAH DUTTON, Janesville, Wis.—*Clog for Cows' Tails while being milked.*—April 30, 1867.—The weighted clamp is attached to the cow's tail to prevent switching; a running ring on the arms secures the attachment.

Claim.—The application of a weight, or an instrument of specific gravity, to a cow's tail while milking her, substantially as described and for the purpose specified.

Also, the wing *b*, in combination with the said instrument or weight, substantially as described and for the purpose specified.

64,208.—J. D. ELLIOT, Grafton, Mass.—*Cloth Folding Machine.*—April 30, 1867.—Improvement on his patent of July 3, 1861. One end of the table is fixed while the other end is being depressed to prevent drawing the cloth from the opposite jaw.

Claim.—Dividing the table and hinging the parts at or near the center, so as to operate substantially as and for the purpose specified.

64,209.—ALFRED B. ELY, Newton, Mass.—*Lett-off and Tension for Yarn, Thread, &c.*—April 30, 1867.—The warp passes from its roller between a rod and rubber roll, the latter adjustable by thumb screws to adjust the tension. From the tension roll the warp passes over a bar connected to levers whose oscillation or depression influences the spring brake bar of the warp roller.

Claim.—First, the bar *D*, lever *D G H* or *D I H*, and spring *J*, combined and operating substantially as described.

Second, regulating the giving-off of the yarn by means of lever *N O*, and spring *Q*, operating against the lugs of a revolving wheel, substantially in the manner described.

Third, the combination of the spring *x* with the end of the presser foot *H* on the arm *N*, to receive the blow of the lug, substantially as and for the purpose described.

Fourth, applying and regulating the tension upon the yarn by means of the adjustable elastic pressure roll, operating substantially as described.

64,210.—GEORGE W. EMERSON, Peru, Ill.—*Churn.*—April 30, 1867.—The octagonal revolving box has flutter wheel dashers within, and has a movable frame formed of strips of metal and connecting rods.

Claim.—First, the churn body, constructed as described, in combination with the shaft *T*, shown in Figs. 1 and 2, with the frame Fig. 1, and the rack *A B*, Fig. 3, substantially as specified.

Second, the flutter wheels *A' B' C'* and *D'*, Fig. 2, one or more, to be used in a churn, substantially as described.

Third, the combination of the blocks or bars *H I' J K*, Fig. 2, one or more, with the flutter wheels, one or more, to be used in a churn, substantially as described.

Fourth, the movable frame, Fig. 2, composed of the strips of metal *L M' N' O P Q R*, connecting bars or rods *H I' J K*, or equivalent, to be used in a churn, substantially as described.

64,211.—DAVID EWING, Indianapolis, Ind.—*Pessary.*—April 30, 1867.—The supporting cup is sustained by a stem having at its lower end a two-branched, out-curved standard, which rests upon the floor of the pelvis.

Claim.—First, the curving arms *c c c c*, when constructed and combined with the rim, substantially as set forth.

Second, the hollow stem *e e*, when the same is combined with the adjustable springs *g g*, in manner and form as aforesaid.

Third, the adjustable springs *g g*, when the same are constructed and adjusted substantially as set forth, and combined with the said hollow stem *e e*.

Fourth, the improved pessary described herein, when the same is considered as a whole device, and constructed in its several parts as aforesaid, and used in the manner and for the purpose hereinbefore described.

64,212.—GEORGE KALE FOSTER, San Francisco, Cal.—*Fire Ladder.*—April 30, 1867.—The ladder is extended upward on the principle of "lazy tongs" by segmental racks on the lower arms.

Claim.—First, the segmental racks *F G* and pinions *T T*, operated by the gear *h g* and hand wheel *c*, substantially as described and for the purpose set forth.

Second, in combination with the ladder, the swivel

joint rings *r r r* on the ends of the fulcrum rods, to support and carry up the hose when the ladder is raised for use.

64,213.—GEORGE GIBBS, Canton, Ohio.—*Plow.*—April 30, 1867.—A double action lever within reach of the plowman is connected with and operates the pivoted stubble cleaner.

Claim.—The lever *a*, rod *b*, joint *c*, and slot *d*, constructed, arranged, and operating in the manner and for the purpose set forth.

64,214.—ALGERNON GILLIAM, Cincinnati, Ohio, assignor to himself, F. and H. DIEHL, same place.—*Harness Saddle.*—April 30, 1867.—The back plate of the cantle is recurved over the rear part of the seat, and attaches the back of the cover to the same, and both to the tree.

Claim.—The arrangement of recurved and overlapping metallic cantle *H*, and lug *C*, or devices substantially equivalent, enabling the fastening the rear portions of the seat, seat cover, and tree securely together by the agency of a single screw, as and for the purposes set forth.

64,215.—ALGERNON GILLIAM, Cincinnati, Ohio, assignor to himself, F. and H. DIEHL, same place.—*Harness Pad.*—April 30, 1867.—The marginal holes in the web of the tree are for passage of thread in attaching the edge facing. The pad cover, tree and bar piece are held together by the end screws, terrets and check hook.

Claim.—First, a harness-pad plate or tree, of malleable iron or other metal, with an upper flange *B*, and lower plane or flat surface, with holes *C*, as and for the purpose stated.

Second, as a new article of manufacture, a harness pad with a tree, consisting of the elements *A B C*, in combination with the pieces *D E F*, substantially as described.

64,216.—OLIVER W. GORDON, Mount Pleasant, Iowa.—*Operating the Treadle and Harness Shaft of Looms.*—April 30, 1867.—The treadles are operated by radial pins on a rotary transverse shaft.

Claim.—First, the combination of the harness frames *C*, and their supporting ends, with the hinged treadles *a*, the tappet shaft *B*, and adjustable tappets *B'*, the whole constructed and arranged to operate substantially as and for the purpose set forth.

Second, the combination of the hinged treadles *A*, actuated positively both in ascending and descending by the adjustable tappets *B'*, projecting from the tappet shaft *B*, with the harness frame *C*, and the end guides *E*, substantially as described.

64,217.—SHILAS GREENELL, Mokena, Ill.—*Seed Sower.*—April 30, 1867.—The shaft with its attached cups rotates in a cylindrical seed trough, discharging the seed on to a curved spreading board, from which it is distributed on the ground.

Claim.—First, the combination of trough *D*, spreading board *O O*, shaft *I*, having arms *S* and cups *J* and hopper *P*, when arranged to operate substantially as described.

Second, the ends *E*, having the loops *H*, in combination with the arms *G* and rod *I*, as described, and for the purpose set forth.

64,218.—D. B. HART, Mentor, Ohio.—*Potato Digger.*—April 30, 1867.—A wheel steadies the digger in the rear; a rotary cutter is adjustable on a slotted bar suspended from the nose of the beam, and curved rods clean the track. The perforated share, screen, mold board and supplementary screen clean the potatoes as they are gathered, receiving a vibratory motion through a bell crank and gearing operated by the ground wheel.

Claim.—First, the digger plowshare *E*, provided with open spaces or perforations, as and for the purpose set forth.

Second, the screen mold board *M*, provided with adjustable screen rods, as and for the purpose specified.

Third, the auxiliary screen *P*, in combination with the digger plowshare *E* and screen mold board *M*, supported and vibrated by means of the combined arrangement of parts specified, viz: the graduated bell-crank lever *S*, standard *S*, link *T*, standard *R*,

connecting rod T', crank pinion wheel T², spur wheel T³, adjustable driver wheel U, slotted strap U', swinging rods R and Q, pivoted hanging Q, beam A, and landside D, all operating as and for the purpose specified.

Fourth, the rotary stalk cutter H and standard H', slot I and set screw J, in combination with the clearing rods K and K', and beam A, as and for the purpose set forth.

Fifth, the use of the chain W, in combination with the truck, as represented, and the employment of the guide wheels V, both operating as and for the purpose specified.

64,219.—WM. H. HARTMAN and A. K. M. PICKERT, Pistoria, Ohio.—*Attaching Thills to Carriages.*—April 30, 1867.—The pin of the thill iron engages in the shackle hooks which are secured to the axle clip; a plug in the rear holds the connection securely, and is itself secured by a screw plate.

Claim.—First, the rubber block E, provided with the guard F, and secured by means of through bolt or screw G to the detached or separate clip bar H, in combination with the slotted stay D, secured to clip I, in the manner shown and described.

Second, the head B, pivots C, and slotted stay D, in combination with the clip I, guard F, screw G, and rubber E, when the several parts are constructed and arranged in relation to each other, in the manner and for the purpose described.

64,220.—WM. MACEY HAYNE, Sacramento, Cal.—*Kiln for Drying and Curing Hops.*—April 30, 1867.

The boxes with removable wire cloth bottoms and tops are placed in the kiln, and the top is left open until the hops are ready to turn. The cover is then slipped in and the box attached to hooks by an eye at each end, which allows the box to be reversed, after which the wire frame cover is removed.

Claim.—A hop kiln constructed with boxes, having the slides F F, or their equivalents, substantially as and for the purpose described.

64,221.—JAMES HITCHENS, Nevada City, Cal.—*Quartz Mill.*—April 30, 1867.

An open metallic cylinder containing quartz reciprocates in an upright position upon a smooth plate, and grinds to powder the quartz which escapes beneath its edge.

Claim.—An ore pulverizer, consisting of the containing cylinder A and the supporting plate B, constructed and operating substantially as and for the purpose herein described.

64,222.—JOHN HOLT, Chelsea, and SIMON G. CHEEVER, Boston, Mass.—*Harness Hame.*—April 30, 1867.

The inclination of the bar of the staple causes the hold-back strap to bear fairly upon the length of the bar, and keeps it clear of the roll of the collar.

Claim.—The projecting angular arrangement of the hold-back strap attachment, substantially as described.

Also, the combination in one integral piece of the breast strap and trace attachment for harness hames, substantially as described.

64,223.—JAMES HOTCHKISS and EZRA BUSS, Springfield, Ohio.—*Die for Brick and Tile Machines.*—April 30, 1867.

Rollers just outside of the mouth of the die project inward to contract the ribbon of clay to diminish the friction on the tapering die and give a smooth surface to the clay. The rollers are cleaned by scrapers and have a miter joint at their contacting edges.

Claim.—The employment of friction rollers, either adjustable or not, applied to the dies of brick and tile machines, for the purposes herein specified.

Also, the contraction of the die to the mouth thereof, in combination with friction rollers on the die, substantially as and for the purpose herein set forth.

Also, the mitered or beveled edges of the rollers, for the purposes herein specified.

Also, the convexly-curved or bulging form of the rollers, for the purpose herein set forth.

Also, scrapers I I, in combination with the rollers, substantially as and for the purpose herein specified.

64,224.—JARVIS W. HOUGHTELIN, Detroit, Mich.—*Car-starting Apparatus.*—April 30, 1867.—The

draw bar is connected to a frame pivoted on the axle; pawls upon this frame act upon ratchet wheels of the axle when put in operation by a treadle.

Claim.—First, the double levers B B, pivoted on the axle near the wheels connected by the bar M, provided with the bent rod H and pawls F F, operated from the draw bar D, all as described and for the purpose set forth.

Second, in combination with the above, the lifting lever C, foot piece K, and connections, as described and for the purpose specified.

64,225.—SAMUEL E. HYNDMAN, Middletown, Ohio.—*Wagon Brake.*—April 30, 1867.—As the tongue and its hounds are slipped back in descending a hill, the brake levers are oscillated and the rubbers brought against the wheels. A bolt is introduced to prevent the action in backing.

Claim.—The brake levers *f f*, rods *e e*, in combination with the slide braces *d d*, hounds *c c*, and tongue *t*, sliding bolt *h* and lock bolt *s*, when the parts are constructed, arranged, and operated in the manner and for the purpose specified.

64,226.—JAMES W. INNIS, Salem, Ind.—*Thill Coupling.*—April 30, 1867.—The thill iron is swiveled by a cross-bolt, in the head of a pin, which sets in a vertical socket in front of the axle clip, and is clamped by a set screw.

Claim.—The thill coupling, consisting of the clip A and pin receiving projection *a'*, cast therewith, through the side of which passes the tightening screw F, pressing into the cavity in the pin D, and operating substantially as described, for the purposes specified.

64,227.—DEDRICK JORDAN, Charlestown, Mass.—*Cutter Guide for Molding Machines.*—April 30, 1867.

The cylindrical guide piece has outward segmental projections for guides, and an inner flange for attachment between two jam nuts.

Claim.—The combination of the cutter guide *a*, constructed with the flange *b*, the cylinder *c*, and the adjustable and retaining nuts *c d*, as and for the purpose specified.

64,228.—ARZA B. KEITH, North Bridgewater, Mass., and T. K. REED, East Bridgewater, Mass.—*Cutting Out Leather.*—April 30, 1867.

The vertically-reciprocating cutter is actuated by a cam on a shaft, which is rotated by gearing connecting it with a pulley shaft. A treadle puts a friction clutch between the pulley and one of the cogs in operation, and on the release of this treadle a spring lever checks the cutter when in its elevated position.

Claim.—The described process of press cutting with handle dies, substantially as described.

Also, the combination with a treadle lever of a stop lever and a friction coupling, arranged to operate substantially as described.

64,229.—GEORGE KINGSBOROUGH, Cleveland, Ohio.—*Ship Chimney Jack.*—April 30, 1867.—The chimney head has segmental sliding doors, within which are pivoted plates which deflect the currents passing through the side openings of the chimney.

Claim.—The slides B, adjustable hinge deflectors C, and guards D, in combination with the channel or chamber I and case J, arranged in the manner and for the purpose set forth.

64,230.—W. IRVING LAIGHTON, Portsmouth, N. H.—*Curtain Tassel.*—April 30, 1867.—The forked catch sliding beneath the cap holds the knot on the cord of the tassel from withdrawal.

Claim.—The combination of the cap or cover *a* with slide *b*, to be attached to the barrel of the tassel, for the securing of the cord *c*, after putting it through the tassel as described, for the purpose aforesaid.

64,231.—JOHN R. LATTIN, Birmingham, Conn., assignor to himself, E. WOOSTER & Co., and F. HULL & Co., same place.—*Skirt Hoop.*—April 30, 1867.—Explained by the claim.

Claim.—The bottom hoop for hoop skirts formed by combining two or more springs in a single cover, the upper edge of which is formed as described, so as to be stitched to the tape of a skirt, as and for the purpose set forth.

64,232.—JAMES T. LEETE, New York, N. Y.—*Burning Fluid.*—April 30, 1867.—Composed of benzine or naphtha of 65° gravity, 40 galls.; charged with carbonic acid gas, and mixed with arrow root, 4 lbs.; glycerine, 1 lb.; gum camphor, $\frac{1}{2}$ lb.; liquid ammonia, 1 lb.; and ambergris, 1 oz.

Claim.—A new compound for a burning fluid having as its base benzine or naphtha, fully charged with carbonic acid, so as to neutralize and partially destroy its inflammability, and the admixture thereafter of the several ingredients in the proportions named, as substantially set forth.

64,233.—HERMAN S. LUCAS, Chester, Mass.—*Preparing Fuel from Coal Dust and Fresh Water Peat.*—April 30, 1867.—Improvement on his patent, August 2, 1864, (No. 43,695.) A solution of common salt is mixed with the coal dust and peat to prevent too rapid consumption of the latter.

Claim.—The application of common salt, either dry or in natural or artificial solutions, in the preparation of fuel from fresh water peat and fine coal, in the manner and for the purposes set forth.

64,234.—JAMES B. MALLALIEU, Chicago, Ill.—*Expanding Mandrel.*—April 30, 1867.—The elastic bush is severed longitudinally so that it may fit on any part of the tapering mandrel accommodating itself to different sized bores in the articles to be turned.

Claim.—The combination of the mandrel A with the movable bush or jacket B without a collar, as and for the purposes set forth.

64,235.—JEREMIAH A. MARDEX, Newburyport, Mass., assignor through mesne assignments to A. B. ELY, Newton, Mass.—*Let-off and Take-up Mechanism for Looms.*—April 30, 1867.—The pendent arm of the rock shaft over which the warp passes from the roller is connected to a bent rod surrounded by an adjustable spring, and the rebent end of this rod has an adjustable dog which operates on a pawl to allow a slight amount of rotation in the yarn roller. The spring is adjustable in tension and the dog in position, and regulate the amount of tension on the yarn.

Claim.—First, the combination of the rock shaft C with its arm E and the spring rod F provided with the adjustable nut F, when constructed and arranged as and for the purpose described.

Second, the combination of the adjustable spring rod F and the dog G with the pawl H and escapement wheel I, substantially as and for the purpose specified.

Third, a let-off motion in looms effected by the tension of the yarn upon a rocker shaft C provided with an arm E, in combination with a spring rod F, a pawl H, escapement wheel I, and the yarn beam B, with its intermediate connections as set forth.

Fourth, in combination with the above described devices for effecting the let-off motion, a take-up motion effected by means of a pawl O attached to the lay in combination with the toothed wheel P attached to the cloth beam, and one or more pawls attached to the frame, substantially as and for the purpose specified.

Fifth, the relieving pawl H operated by the tension of the yarn upon the rock shaft through the medium of the adjustable spring rod F, substantially as described.

Sixth, the spring rod F when made with a screw thread, in combination with the nut F, rock shaft C E, and relieving pawl H, substantially as set forth.

64,236.—B. MARTIN, Prairie du Chien, Wis.—*Door for Railway Cars.*—April 30, 1867.—The doors have a trapezium form to fit the slanting cleats and are held by cleats and the uprights. Pins pass over the upper corners and hold them down. The corners are braced by metallic shoes. Ledges on the side form pockets for the doors while out of use, or hooks attach them to eyes on the frame above.

Claim.—As an improvement in railroad cars for carrying grain in bulk, the combination of the trapezoidal door C, inclined cleats B, checks D, cleats H, recesses I, pins E, notched shoes F, and bolts G, all constructed and arranged to operate as and for the purposes specified.

64,237.—CHARLES Z. MATTISON, Buffalo, N. Y.—*Tucking and Plaiting Attachment for Sewing Machines.*—April 30, 1867.—One of the two folders is elastic and attached by one end to the rock shaft

which actuates the oscillating needle-carrier, while its other end is always beneath the end of the other rigid folder. The rocking of the shaft causes the end of the elastic folder to push itself into and to make the fold of the cloth while the stitch is being made, but to retreat and relieve the cloth of its pressure when the feed takes place.

Claim.—First, the spring bar A attached to the rocker of a sewing machine, and operating as and for the purposes and substantially as described.

Second, the adjustable sliding rule D, in combination with the spring bar A attached to the rocker, the same lapping over said spring bar the width of the desired hem, fold, or tuck, and operating in the manner and substantially as set forth.

64,238.—SHANNON MCGUFFIN, Rising Sun, Ind.—*Churn Dasher.*—April 30, 1867.—The funnels on the rod are attached to the perforated disk dasher by a spring, and the two differently constructed dashers may be disconnected when required.

Claim.—The combined inverted funnels and butter gatherer heretofore referred to.

64,239.—E. R. MCKINNEY, Lacon, Ill.—*Gate.*—April 30, 1867.—By drawing on the pendants attached to the swing bar the gate can be opened or shut by an equestrian without dismounting.

Claim.—The arrangement and combination of the cross-bar B near the top of hinge post with its pendants C C and r r connecting with the lever L on the top bar of the gate; also device of lever L with rods t t connecting with latch, as herein described.

64,240.—G. L. MCKNIGHT, Worcester, Mass.—*Divider and Calipers.*—April 30, 1867.—A bent spring beneath the pivots tends to expand the arms which are adjusted by a nut on a screw pin between the out-curved upper ends. A jam nut fixes the adjustment.

Claim.—First, the combination with the arms of calipers or dividers of the screw C, slotted nut D, and tightening nut F.

Second, the combination with the curved ends E E and arms A of the slotted nut D and tightening nut F, substantially as and for the purpose set forth.

Third, the combination with arms A, having shoulders l l, of spring g, substantially as and for the purposes set forth.

Fourth, the combination of nut D with the curved ends E E of arms A for the purpose of adjusting the arms, substantially as set forth.

64,241.—WM. H. MCNARY, Brooklyn, N. Y.—*Knitting Machine.*—April 30, 1867.—This relates to that class of knitting machines employing needles with short inflexible hooks from which the stitches are taken by stitch hooks without any longitudinal movement of the needles themselves. The improvements are especially applicable to machines in which the rotary or lateral motion of their needles is controlled for the purpose of giving the desired form to stockings, &c., by means of a rotary or studded cylinder or drum and a threaded wheel, as described in McNary's patent, May 15, 1860, No. 28,390.

Claim.—First, the combination with the needle ring, the presser having the compound motions, substantially as and for the purpose described.

Second, operating the stitch hooks by cranks upon separate shafts carrying gear wheels engaging corresponding wheels on the main shaft, substantially as and for the purpose described.

Third, connecting the wheels of the switch wheel directly with the needle ring, substantially as and for the purpose set forth.

64,242.—MOSES MILLER, East Gaines, N. Y.—*Land Roller.*—April 30, 1867.—The front rollers are separated sufficiently to admit the seat. Attached by its pivoted cross reaches to the middle of the frame is another independently working roller and frame.

Claim.—The roller B, having an independent frame M, and the cross reaches N N, in combination with the rollers A A and the frame C, operating in the manner and for the purpose shown and described.

64,243.—CLARK MOORHEAD and ISAAC GRIER, Lewistown, Ill.—*Washing Machine.*—April 30, 1867.—The hollow revolving slat cylinder which contains

the clothes has beaters hung at each end that turn over as the cylinder revolves and beat the clothes.

Claim.—The beaters *b*, hinged to the inner ends or sides of the revolving drum for the uses and purposes above named, substantially as above set forth.

64,244.—GEORGE F. NEALE and LOUIS AMEDE, South Boston, Mass.—*Glass Annealing Apparatus.*—April 30, 1867.—The wheeled metallic case is run on a sunken track into the annealing oven and there receives plates of flattened glass from the table which is moved from the flattening chamber. A turn-table in the oven enables the truck to be switched out to a side track on which it is withdrawn from the oven.

Claim.—The combination of the railway and the system of carriage boxes with the flattening furnace, such railway being so arranged as to enable the said annealing carriages or boxes to be run into and out of the said furnace, and to rest while on that part of the railway which is without it, substantially as specified.

Also, for the purpose described, the combination and arrangement of the interior track *i*, the turn-table *k*, or its equivalent, the two exterior tracks *r r* and *t t*, and the transferring carriage *B*, provided with the track *u*, as specified.

Also, the combination and arrangement of the sunken space *h* with the furnace and railway, constructed and arranged substantially as described.

64,245.—A. B. NEWMAN Jr., Watkins, N. Y.—*Box for Propagating Plants.*—April 30, 1867.—The box has cleats inside leaving an impression in the earth where it is to be detached; one side opens on hinges and is secured by a button.

Claim.—A box or trough for propagating or growing plants, vines, vegetables, small fruits, shrubs, seedlings, and stocks, as herein described.

64,246.—JAMES NICHOLSON, Philadelphia, Pa.—*Apparatus for Manufacturing Lap-welded Tubes.*—April 30, 1867.—Welding grooves are formed on each set of rolls for lap-welding tubes. Openings are formed in the front of the furnace next the rolls, and trains of rollers convey the tubes therefrom.

Claim.—In combination a furnace with one or more openings in its front, which will admit of the simultaneous discharge of two or more heated plates, or skelps, with a set of rolls having two or more welding grooves, and two or more trains of carrying rollers, all substantially as herein described.

64,247.—JOSEPH B. OKY, Indianapolis, Ind., assignor to himself and W. A. SCHOFIELD, same place.—*Combined Stove Cover, Lifter, Hammer, &c.*—April 30, 1867.—The combined tool is composed of two forms of hook, two lips, a hammer and claws.

Claim.—The utensil herein described, consisting of hoop *B*, lips *D D* and *C*, hammer *F*, hook *G*, and handle *A*, provided with a bifurcated end *H*, arranged and combined as set forth.

64,248.—CHARLES H. PALMER, Newark, N. J.—*Pocket Knife.*—April 30, 1867.—The actuating spring works inside the back of the handle, which crooking round forms a shoulder for the blade and boxing for the forward end of the spring. The handle is lined with brass which turns round its out edge. The scales are attached by spurs formed on the back.

Claim.—First, the spurs *b* formed on the back *B*, and combined and arranged with the checks *C* and scales *D*, substantially in the manner and for the purpose herein specified.

Second, the employment in pocket knives of the spring *E*, mounted separate from the back, and pressed backwards against the same by the opening and shutting of the blade, substantially in the manner and for the purpose herein specified.

Third, the housing or fitting of the spring *E* within the shoulder or recess formed by the part *B'* on the outward or forward extremity of the back *B*, the several parts being combined and arranged, substantially as and for the purpose specified.

64,249.—GEORGE T. PEARSALL, Apalachin, N. Y.—*Carriage Shackle.*—April 30, 1867.—The thills are elevated, the pintles dropped into their sockets, and the beveled edges of the spur crowd them against the rubber and prevent rattling.

Claim.—The pintle *B*, spur *C*, recess *E*, spring *D*, and socket *F*, substantially as described, forming a new and useful improvement in attaching thills or poles to carriages or other vehicles.

64,250.—HENRY PEMBERTON, Allegheny, Pa.—*Manufacture of Soap.*—April 30, 1867.—100 parts of finely ground cryolite are added in small quantities to milk of lime containing 75 parts of quicklime. The mixture is condensed by boiling to 30° Baumé and 3½ parts of grease added for each pound of cryolite.

Claim.—The preparation of soap from cryolite, substantially in the manner hereinbefore described.

64,251.—HENRY PEMBERTON, Allegheny, Pa., and BERNHARD HEINEMANN, Natrona, Pa.—*Box, Can, or Vessel for Putting up Caustic Alkalies, &c.*—April 30, 1867.—The box is covered on the inside with a solution of silicate of soda or potassa and dusted with powdered gypsum.

Claim.—Protecting the surface external or internal, or both, of barrels, cans, or cases made of paper, muslin, wood, or other vegetable substance, or either, or either or both surfaces of paper, muslin, or other vegetable fabric, for putting up caustic alkalies and other solid or liquid substances which require protection from air or moisture, or which are liable to penetrate their covering by means of a coating of silicate of soda or potassa, in combination with powdered gypsum, lime, or other substance capable of combining therewith, substantially as and for the purposes hereinbefore described.

64,252.—GEORGE R. POWERS, Kingston, Mass.—*Stencil Plate.*—April 30, 1867.—The plate is attached to a sleeve upon a cylindrical block in a recess above which is a helical spring by which the plate is raised, when it may be turned upon the block by a handle.

Claim.—First, the stencil plate *A*, in combination with the shell *B* and handle *D*, substantially as specified.

Second, the cylinder *C* provided with notches or grooves, in combination with the spring *E* or its equivalent, constructed and operating substantially as and for the purpose specified.

Third, the combination of the cylinder *C*, spring *S*, and handle *D*, as set forth.

64,253.—JACOB REESE, Pittsburg, Pa.—*Manufacture of Iron with Steel Surface.*—April 30, 1867.—The outer surface of the faggot or bloom is converted into a sub carburet by exposure in a furnace to a carbon or hydrocarbon.

Claim.—Giving a hard and highly polished surface, or a hard surface susceptible of high polish, to sheet iron and other articles of rolled, forged, or swaged iron by exposing the bar, bloom, pile, or slab, from which such articles are to be rolled, forged, or swaged to partial cementation, so that the iron may be carburated on the outside to a sufficient depth to give the required steel coating to the article manufactured therefrom, while the interior portion of the mass of iron retains the nature and characteristics of malleable or wrought iron, substantially as hereinbefore described.

Also, converting into steel by cementation the exterior of piles, slabs, blooms, or bars of iron designed to be rolled, forged, or swaged, while the interior or body of the piles, slabs, blooms, or bars remain unconnected and retain the ductility and softness of malleable iron, substantially as and for the purposes hereinbefore described.

64,254.—DANIEL T. ROBINSON, Boston, Mass.—*Machine for Making Horseshoes.*—April 30, 1867.—The bar after creasing is placed between the shears and the blank cut off. It is then driven by the forward movement of the "former" between the two reducing oscillating dies to form it in shape. The punch is then automatically brought over it and driven down by a blow of the spring hammer. The hammer being raised the punches are carried to the cooling tank and dipped therein, and the process repeated.

Claim.—The shears or cutting mechanism, consisting of the adjustable cutter block *C* and the lever *f*, operated by the finger *d* and spring *p*³, all con-

structed and arranged in the manner and for the purpose as before described.

Also, the mechanism for dipping the punches into water, consisting of the arm or carrier F, friction roller *j'*, carriage P, guides Q Q, and furcated lever R, the said lever being operated by the lever J, in the manner as before described.

Also, the water tank combined with this machine, in the manner described.

Also, the peculiar construction as well as the application of the shaping and reducing dies *j j*, as before described.

Also, combining with the carriage P the spring hook *m'* and abutment *s*², essentially in manner and for the purpose as before explained.

Also, the mechanism for operating the sliding carriage D, the same consisting of the lever J, bar M, connecting rod O, and wiper K, constructed and combined substantially in manner and to operate as before set forth.

Also, the combination of the hammer bar of the tripper *n*² and stud *q*³ of wiper K, under the arrangement and for operation as set forth.

Also, the hook *m*² in combination with the hammer and with the lip *b*³ on arm F, for the purpose of starting the punches from the shoe, substantially as described.

Also, the peculiar construction and application of the forming die for shaping the snow shoes, essentially as described.

Also, the combination and arrangement as herein described of all the several devices constituting this machine.

64,255.—SEYMOUR ROGERS, Pittsburg, Pa., assignor to LUMAN ROGERS, same place.—*Cotton-bale Tie.*—April 30, 1867.—One end of the hoop is looped around the link and the corrugated end is passed through the loop, being detained by the folds which act as teeth in engagement.

Claim.—First, the loop *c*, with the rigid arm *c'*, when constructed substantially as and for the purposes above set forth.

Second, the loop *c*, either with or without the rigid *c'*, in combination with the corrugated or rigid strap end *a* of a metallic hoop, constructed substantially as and for the purposes above set forth.

Third, the rigid arm *c'* of a loop *b*, in combination with the slot *e*, and the folded end *d* of a metallic hoop, constructed substantially as and for the purposes set forth.

64,256.—HENRY SCHEFFER, St. Louis, Mo.—*Preserving Eggs.*—April 30, 1867.—The eggs are first dipped in a solution of alum and salt and then in a solution of silicate of soda or potash.

Claim.—The process of forming a silicious coating by the application of a silicate and any simple or double alkaline salt, acting substantially as described in process numbered there.

64,257.—ADOLPH SCHLINGMAN, West Alexandria, Ohio.—*Bedstead Fastening.*—April 30, 1867.—Side cleats on the rails have mortises to receive the screw pieces which are engaged therein by a traversing key.

Claim.—Securing a bedstead rail by a tongue D, which being screwed or otherwise firmly secured to the post, is traversed by a key C, which, as it is driven downward, bears against the rear side of the cleat, and acts to close and perfectly secure the joint in the manner set forth.

64,258.—A. J. SENATZ and G. W. KNOWLTON, Sacramento, Cal.—*Amalgamator.*—April 30, 1867.—The two copper-bottomed pans are connected together by bars and communicate with each other by a pipe, one pan being placed slightly above the other. A vibratory motion is given to the pans by means of a crank shaft and springs. The vibrating riffle frames are supported above the pans by metallic staples and transverse bars which are slotted to convey quicksilver to the bottom of the pan.

Claim.—The copper-bottomed pans, with the iron rods or bars and slots in the end, fastened to the sides of the pans with pins, and by means of which rods or bars the pans are flattened together, and an undulating motion is secured for the water and earth which are dashed upward against the stationary riffles,

whereby the earth or sand is prevented from becoming solid.

Also, as a part of the same machine, the turned up ends of these pans, and the stationary riffle beds connected with the pans, all of said parts being the machine in combination which produce the intended effect.

64,259.—JAMES B. SKINNER, Rockford, Ill.—*Plow.*—April 30, 1867.—To reduce the friction and clogging on the landside, a strip is welded on the standard next the landside, to which it is bolted. A diagonal brace welded to the standard connects with the beam, and a cross-brace connects the mold board with the landside. The mold board and share have lips that overlap each other to make a smooth joint.

Claim.—First, the brace *d*, welded or fastened to the lower part of the standard and the landside, as and for the purpose described.

Second, the arrangement as described of the plow beam, mold board, landside, and handles, with the curved standard and diagonal brace C, for the purposes of reducing the weight and increasing the strength of the plow, as set forth.

Third, the standard constructed and connected with the landside and inner handle, for the purpose of avoiding friction or clogging, as set forth.

Fourth, the arrangement as described of the overlapping lips *i i'* on the inner front corners of the mold board and share, for the purposes set forth.

64,260.—GIDEON O. SPENCE, Titusville, Pa.—*Apparatus for Burning Petroleum, &c., in Conjunction with Steam or Heated Air.*—April 30, 1867.—The hydrocarbon is thrown in jets against the angular corners of the heated body, and sufficient oxygen is provided to consume the resulting fumes.

Claim.—First, providing within the fire box or furnace, for the purposes herein set forth, a solid substance or its equivalent, capable of receiving and retaining the required degree of heat for resolving petroleum or other fluid hydrocarbons into gases, when brought in contact with the same.

Second, the within-described method of supplying the fuel and oxygen, by discharging petroleum or other fluid hydrocarbons through one or more pipes, having their orifices within blowpipes or their equivalent, when applied and operated in combination with a heater, substantially as described and for the purposes herein set forth.

Third, the use of one or more blowpipes, or their equivalent, for the purpose of supplying oxygen and concentrating the heat, when applied and operated in combination with the heater, for the purposes herein set forth.

Fourth, the within-described method of revolving and consoling crude petroleum and other fluid hydrocarbons, by impinging one or more currents or jets of the same upon or against a solid heated substance, or its equivalent, within the fire box or furnace, capable of receiving and retaining such a degree of heat as shall resolve said crude petroleum or other fluid hydrocarbons into gases, for the purposes herein set forth.

Fifth, an apparatus for burning crude petroleum and other fluid hydrocarbons, consisting substantially of a heater, one or more pipes for supplying the fluid hydrocarbon, and one or more blowpipes, combined and applied for the purposes herein set forth.

64,261.—E. M. STEVENS, Boston, Mass., assignor to ALFRED B. ELY, (trustee,) Newton, Mass.—*Shuttle Guard for Looms.*—April 30, 1867.—The guard prevents the escape of the shuttle, when down, and is hinged to enable it to be readily raised when required.

Claim.—The hinged guard, in combination with a positive self-locking device, which shall hold the same in position, when down, against any blow of the shuttle, while it may be readily unlocked and thrown up by the operative when desired, substantially in the manner and for the purpose set forth.

64,262.—JOHN P. TARNUTZER, Fond du Lac, Wis.—*Cultivator.*—April 30, 1867.—When the shaft is turned by the pressure of the driver's foot on the bars of the capstan-head, the hinged cultivator frame moves laterally, operated by the pinion on the pinion rack, by which the intermediate frame is also moved. The ground is pressed by rollers in front of the teeth. The handle on the toothed frame raises it above the

spring catch, which holds it while surmounting obstacles.

Claim.—The shaft D, with pinion p and pinion rack r, and capstan-head C, and movable frame B.

Also, the rollers F F and sheave S, upon which a chain passes.

Also, the hinges h h, upon which the frame E is hung.

Also, the wings w w.

Also, the movable frame B.

64,263.—HEADLEY THOMPSON, Hector, N. Y.—*Brand for Marking Animals.*—April 30, 1867.—The metallic letters are removable from their frame and may be used either as types or brands.

Claim.—The movable type A, constructed with stems A' thereto attached, in combination with the stock B, constructed with sockets B' and the thumb screws C, and arranged for use substantially as and for the purpose set forth.

64,264.—L. M. TOWNSLEY, Sedalia, Mo.—*Fastening for Window Blinds.*—April 30, 1867.—The cog wheel on the window blind gears into a cog wheel on a line coincident with the line of the axis of the blind hinges attached to the window frame. The axle of the operative gear passes through the frame to the interior to a crank, one-half turn of which opens or closes the blind.

Claim.—The combination and arrangement of the catch D, the springs d, and the levers D² and D³, substantially as described and set forth.

64,265.—ADELIA WALBORN, San José, Cal., assignor to himself and J. H. ATKINSON, San Francisco, Cal.—*Washing Machine.*—April 30, 1867.—The stationary washboard in front is faced by a movable one kept in position by two eccentric buttons fastened to the ends of the box. Wooden pegs in conjunction with a sliding clamp hold the clothes as the frame moves. The lever operates the movable head piece of the sash on bearings in the side pieces of the frame, being assisted by a rubber spring.

Claim.—The double washboards O and K, the eccentric buttons B, the sash frame N, with clamp C, the lever handle G, the spring J, in combination and exactly as set forth, and for the purposes specified.

64,266.—JOHN S. WHITE, Boston, Mass.—*Window Brush.*—April 30, 1867.—The bristles are secured with copper wire; a metallic plate stiffens the cap, which turns round the central attachment pin that fastens the cap to the flexible back. The handle shifts the brush as it wears.

Claim.—The improved window brush as made with the flexible backing and the inflexible cap plate connected by a center pin, as and for the purpose set forth.

Also, the arrangement and combination of the stiffening plate c with the cap plate and the inflexible backing and its bristles, as explained.

64,267.—CHARLES WILLIAMS, Manchester, N. H.—*Cooking Stove.*—April 30, 1867.—The fireplace has beneath it a sifter, into which the cinders fall and which may be shaken longitudinally by a rod extending outside. The lower of two ovens has top, bottom, and sides of steatite held by metallic corner pieces.

Claim.—The arrangement of the hearth U, the ash sifter G, and box H, their chambers D E, and the fire place A.

Also, the combination and arrangement of the two ovens B C, the ash sifter and box chambers D E, the fireplace A, the flues I K L M N O P R S and T, and dampers h l l, as set forth.

64,268.—DARIUS WILLIAMS, Rock Co., Wis.—*Washing Machine.*—April 30, 1867.—The tilting concave washboard sustains the clothes beneath the roller in a frame oscillated by a crank and sliding vertically in its rock bar.

Claim.—First, the tilting washboard, composed of parts S and S' and slats e, in combination with part T and bearings e, when both are constructed and used substantially as and for the purposes described.

Second, the roller R, operated by means of the framework composed of parts I K L M N and O, substantially as described, in combination with the tilting washboard, composed of parts S and S' and slats e,

when the whole are connected together and operated substantially as and for the purpose described.

64,269.—CHARLES L. ALEXANDER, Washington, D. C.—*Printers' Type Case.*—April 30, 1867.—The horizontal partitions, instead of being at a right angle to the bottom, are made oblique thereto so as to be nearly vertical when in use.

Claim.—A type case having the lower or front sides of the boxes inclined toward the upper or rear part of the case, substantially as described.

64,270.—JOHN J. ALVORD, Tecumseh, Mich., assignor to himself and SAMUEL C. BLINN, same place.—*Hoop Machine.*—April 30, 1867.—The knife is hung from the frame, is operated by a pitman connected with the crank wheel of the driving shaft, and cuts the hoop at a single drawing stroke. The pawls are pivoted to the arms and, engaging the teeth of the ratchet wheel, feed the table forward the thickness of a hoop.

Claim.—The arrangement of the arms O P, pivoted together upon the shaft M, and having the pawls R S secured thereto, ratchet wheel T, vibrating frame L, bearing the said shaft M, the sliding table K, to which is secured the rack K, meshing into the gear wheels N, and cams J upon the shaft I, substantially as herein set forth, for the purpose specified.

64,271.—JAMES ANNIN, Le Roy, N. Y.—*Cleaning Watches, Jewelry, &c.*—April 30, 1867.—The article to be cleaned is dipped in a liquid composed of cyanuret of potassium, soft water, alcohol, and boxwood saw dust.

Claim.—The process of cleaning watches, jewelry, silver and plated ware, &c., by the ingredients and in the manner substantially as represented and described.

64,272.—JABEZ K. BARCOCK, Shortsville, N. Y.—*Hay and Manure Fork.*—April 30, 1867.—The ferrule and head are cast in one piece; holes are drilled into the solid head and the tines secured therein by transverse keys.

Claim.—The ferrule A and head B, cast in one piece, with holes drilled longitudinally in the head to receive the tines, and holes drilled transversely through the heads for the keys or pins D, substantially as and for the purpose herein set forth.

64,273.—JOSEPH BARROW, Mobile, Ala.—*Buckle.*—April 30, 1867.—Explained by the claim and illustration.

Claim.—The buckle constructed of a continuous rigid frame A, with bars C, on which are hung the tongues D, having independent motions, and the clasp F for holding the ends of the strap, as herein represented and described.

64,274.—P. D. BECKWITH, Dowagiac, Mich.—*Grain Drill.*—April 30, 1867.—The claim supporting the cover is attached to the adjusting bail, which simultaneously adjusts all the covers, being operated by a curved hook.

Claim.—The mode herein described of securing or attaching the chain to the bail A by means of the rod or hook d, whereby a simple and permanent attachment without weakening the bail is obtained, substantially as specified.

64,275.—G. W. BENTON, Dansville, N. Y.—*Washing Machine.*—April 30, 1867.—The suds box rests on springs, and rollers are fitted transversely therein. The adjustable cylinder has rubber arms, is operated by a hand crank, and regulated by springs bearing on the shaft of the cylinder, and held down by rods.

Claim.—The within-described arrangement and combination of the springs B, frame C, concave series of rollers D, cylinder a, rubbers c, springs E and adjusting screw rods F, all operating in the manner and for the purpose specified.

64,276.—JOSEPH W. BRADLEY, Rocheport, Mo.—*Washing Machine.*—April 30, 1867.—The perforated cylinder is turned by a hand crank, and has T-shaped slats attached, which form inwardly projecting ribs; a corrugated perforated partition forms a wash-board for each division.

Claim.—The cylinder G, consisting of the T-shaped

slats, placed a short distance apart around its periphery, projecting ribs *a* upon the inside of the perforated cylinder heads, grooved or corrugated partition *J*, and door *k*, as herein set forth for the purpose specified.

64,277.—CHARLES R. BROADBENT, Boston, Mass.—*Slipper*.—April 30, 1867.—The pulp is laid on blocks, and is varnished when rigid.

Claim.—As a new article of manufacture, a slipper or shoe made of paper, substantially as described.

64,278.—ROBERT BROOME, Central Falls, R. I.—*Cooking Vessel for Frying, Steaming, &c.*—April 30, 1867.—The adjustable kettle and steamer are regulated by the various positions in which they are placed, and by the juxtaposition of the perforated parts to each other.

Claim.—The culinary vessel or utensil herein described, composed of parts A B C and D, when constructed, combined, and arranged substantially as set forth.

64,279.—A. H. BROWN, Springfield, Vt.—*Meat Hammer*.—April 30, 1867.—The hammer face has angular projections.

Claim.—A meat hammer having its face or faces provided with one or more angular edges, substantially as and for the purpose herein set forth.

64,280.—GEORGE W. BROWNE, New York, N. Y.—*Row Lock*.—April 30, 1867.—The row lock is attached by a swivel to a plate hinged inside the gunwale, so that when the oars are not in the thole it will swing down inwardly.

Claim.—The arrangement and combination of the annular plate C, centrally pivoted thole D and plate B, secured to the gunwale of the boat, as herein set forth.

64,281.—D. E. CAMPBELL, Boston, Mass.—*Attachment for Door Key*.—April 30, 1867.—The clutch is sprung over the handle shank and the arm extended through the key ring; the sliding bar has an indentation engaging the key ring.

Claim.—A safety attachment for the keys of doors, consisting of a bar B, having spring arms or jaws D D and a spring sliding catch G, when arranged and combined together, and so as to be used and to operate substantially in the manner described.

64,282.—W. W. CARPENTER, Middletown, N. Y.—*Heating Stove*.—April 30, 1867.—The vertical air pipe has a sleeve damper by which the exit of air immediately above the stove is regulated. Above this damper a branch leads to the main flue, and this branch and the main air pipe have circular oscillatable dampers.

Claim.—The horizontal pipe E resting upon the grate, its ends passing through the sides of the stove, and supporting the vertical pipe D centrally in the furnace, said pipe D provided with the adjustable ring L, and connected to the stovepipe H, where all are constructed and arranged as herein set forth for the purpose specified.

64,283.—WILLIAM B. COATES, Philadelphia, Pa., assignor to THOMAS REECE and ARTHUR CLARKE, same place.—*Bag for Preserving Ice*.—April 30, 1867.—The woolen bag is put into a somewhat larger one of cotton-duck or water-tight fabric. A cross seam near the bottom leaves a chamber below for accumulation of water.

Claim.—First, the application of woolen bags of one or more thicknesses, for the purpose of preserving ice.

Second, the outside water-proof bag of oil-cloth, cotton duck, rubber cloth, or equivalents, and chamber for drippings K, the discharge openings at H H and at G G and N, strap and buckle D and cord E.

Third, the bags A and B in combination, the whole being made and constructed as herein described.

64,284.—OWEN COLLINS, New York, N. Y.—*Fireplace Heater or Furnace*.—April 30, 1867.—The grate bars are hollow to admit streams of air, and the fire space is surrounded by a smoke-consuming chamber, and that by an air space. The caloric currents

pass into a complexly-formed chamber above and issue through a horizontal flue.

Claim.—First, the arrangement of the tubular grate bars with relation to the rear and side chambers K L of the base communicating therethrough with the space or spaces within the jacket M, substantially as specified.

Second, the smoke-decomposing chamber G, made to encompass the fire chamber and communicating therewith by smoke passages *b*, also provided with suitable air inlets and outlets, as herein set forth.

Third, the combination of the side and bottom air inlets *h i* to the chamber L of the base, and controlled by dampers or valves J, to vary the ingress, essentially as specified.

Fourth, the draft tubes J, arranged to descend into the fire and controlled by dampers *d*, substantially as shown and described.

Fifth, the reversely-conical or concave radiating reflectors N O and deflector Q, arranged for operation essentially as represented and described.

64,285.—P. H. COLLINS, Philadelphia, Pa., assignor to HARRY BITTER and A. MERITT ASAY, same place.—*Clamp for Closing Ruptures in Fire Hose*.—April 30, 1867.—The concave plates are hinged together and their free ends held by a ratchet pivoted on one jaw, which engages a catch on the other. A handle may be attached to one of the jaws to assist in carrying the hose.

Claim.—The recessed clamps, constructed substantially as described.

64,286.—L. O. CROCKER, Braintree, Mass., and G. F. FIELD, Weymouth, Mass.—*Ticket Cutter*.—April 30, 1867.—The stripper plate is connected by a spiral spring and guide wire to the point of the cameo die jaw, and is pivoted to the other jaw, the spring tending through it to open the jaws when closed. One of the handles is bent around and formed into a pin to enter a cavity in the other, and has a spiral spring pressing outward.

Claim.—The arrangement of the stripper *k*, with its outer end supported against and operated by a spiral spring or springs *l*, and its inner end jointed or connected with and so as to be operated by the counter-die jaw *b*, substantially as set forth.

Also, combining with the wire *f* the spring *g*, operating as and for the purpose substantially as set forth.

Also, in combination with the stripper plate *k*, (moved from the die before the action of the counter-die jaw,) the inclination of the cutting face of the die, both laterally and longitudinally, substantially as described.

64,287.—JOHN C. K. CROOKS, Birmingham, Mich.—*Attachment for Artificial Teeth*.—April 30, 1867.—The metallic loops are inserted with their flattened shanks in the longitudinal line of the tooth, while the loop itself is at right angles to said line.

Claim.—The loop or eye *a*, provided with the double shank *b*, the two ends of which are flattened in line with each other in such a manner that their outer extremities shall be widened to a greater degree than their points of connection with the eye, thereby being slightly wedge-shaped, said shank being inserted in the tooth A with the said flattened ends in the longitudinal line of the tooth, while the eye itself is at right angles to said line, substantially as herein shown and described.

64,288.—GEORGE DEWEY, Blooming Valley, Pa.—*Window Sash*.—April 30, 1867.—The glass is held in place by angular pieces of rubber; strips of the same between the sashes or the same and the beading prevent draft and act as a sash support.

Claim.—First, securing panes of glass in sashes or frames by means of triangular india-rubber strips or pieces *II*, substantially as described.

Second, the flat india-rubber strips *d* on the inner faces of window sashes, substantially as described.

64,289.—ALLEN O. DIVINE, Cambria Mills, Mich.—*Gate*.—April 30, 1867.—The gate is hinged at the middle standard and folds back when a narrow passage is alone required. The other section is supported on rollers, those at the feet of the standards running in ways on the sill. Hooks on the posts fasten the gate.

Claim.—A gate constructed of the hinged parts A B, as described, in combination with the way *m*, friction rollers *h* and *i*, and catch *s*, so arranged as to form at once a swinging, sliding, and folding gate, substantially as set forth.

64,290.—E. N. DODGE, Plainview, Minn.—*Whiffletree.*—April 30, 1867.—The tug arms have disks whose segmental racks engage the racks upon the two slide pieces, which are connected by an adjusting screw rod. The arms have oscillatory movement, with the shoulders of the horse as a common single-tree.

Claim.—The arrangement of the rods B B, the bars C C, and the connecting rod D, constructed and used as and for the purpose herein specified.

64,291.—E. O. DOUD and W. F. BEARDSLEY, Penfield, N. Y.—*Potato Digger.*—April 30, 1867.—The shovel drops the potatoes into a longitudinally-slatted and reciprocating riddle. The oscillating clearer plate whose projections pass up between the slats of the riddle and the rake, which draws the potatoes backward of the shovel, receive movement from the wrist pin of a wheel geared with the driver wheel.

Claim.—First, in combination with the shovel S the reciprocating hook H, arranged and operating substantially as shown and described.

Second, raising the head of hook H upon the ways *l* by means of the pivoted lever *y*, which is operated by the pin or tappet *t*, substantially as and for the purpose set forth.

Third, attaching the pitman *P'* to the shank O, as shown, for the purpose of producing a gentle pressure or force through the pitman *P'* upon the rake head, the wrist pin *u* acting as a fulcrum to effect it.

Fourth, in combination with the longitudinally-reciprocating riddle or separator R, the reciprocating cleaner *k*, constructed, arranged, and operating substantially as and for the purposes set forth.

Fifth, the heads E, constructed as shown and described, in combination with the pitman *r*, depressions *r'*, and pins *c*, all operating conjointly, as shown and described, for the purpose of rotating the cleaner *k*.

Sixth, the sinuous slot *T'* and rack *g*, in combination with the shaft S' and pinions *P''*, for the purpose of raising and lowering the machine, and at the same time retaining the pinions G and G' in gear with the spur wheels of the ground wheels after the machine is lowered sufficiently to put them into gear, as set forth.

Seventh, the sinuous slot *T'* in the stock or yokes J, as shown, and for the purposes set forth.

Eighth, the arrangement of the hand wheel K, shaft M, ratchet and pawl *w'* and *y'*, step box N, pinion P, and bevel wheel B', for the purpose of revolving the ground wheel shaft S, and retaining the desired elevation or gauge of the machine.

Ninth, the relative arrangement of the ground rollers D, as shown, in combination with the shovel S and jointed or adjustable tongue T, in potato diggers, for the purposes set forth.

64,292.—J. W. DOUGLAS, Middletown, Conn., as signor to W. and B. DOUGLAS, same place.—*Hose Coupling.*—April 30, 1867.—The sections of the coupling are adjusted and secured by an eccentric nut in combination with lugs with corresponding tongue and groove attachment.

Claim.—First, the inclined lugs B B', provided with corresponding groove and tongue, for the purposes and substantially as described.

Second, the inclined concave grooved nut C, in combination with the lugs B B', substantially as described.

64,293.—W. DURVEA, Glen Cove, and W. ENNIS, Hudson, N. Y.—*Heating Drum Attachment for Furnaces.*—April 30, 1867.—The air passes downward in a drum surrounded by the calorific current and traversed by a central flue; it then passes through a horizontal pipe, and upward through a similar drum to the place of exit.

Claim.—The apparatus constructed substantially as described of tubular radiating smoke boxes D D', within a chamber A, partitions G G', and smoke and air inlets and outlets arranged relatively to each other

to establish a circulation through the apparatus, substantially as specified.

64,294.—W. DURVEA, Glen Cove, N. Y., and W. ENNIS, Hudson, N. Y.—*Furnace for Burning Saeudust, &c.*—April 30, 1867.—Improvement on the patent of Ferdinand Braun, May 17, 1864, (No. 42,816.) The perforated inverted conical fire pot has air apertures above the fuel to consume the smoke when air is admitted. The bottom has an oscillating shaking movement by a radial arm. Fuel passages from a drying chamber above are regulated by an oscillating plate operated from the outside.

Claim.—First, the combination of the perforated conical fire pot or chamber B, with its dome-shaped roof *a*, and shaking grate D, fuel-feeding tubes or passages *c* communicating with a drying chamber or receptacle above, and regulating plate or valve C, substantially as specified.

Second, the combination with the fire chamber B and fuel supply passages *c* of the air inlets *f*, arranged relatively to the passages *d* and dome *a*, essentially as herein set forth.

64,295.—NATHANIEL T. EDSON, New Orleans, La.—*Paddle Wheel.*—April 30, 1867.—The floats are kept in a vertical position while in the water by their rectangular arms which pass through the slots of the swivel blocks on the spokes of the eccentric wheel, which is driven by independent cog gearing.

Claim.—First, a combination of the float arms with their lugs *f*, the swivel blocks H, and wheels A B and F, when wheel F is constructed with arms firmly attached to its inner rim, and the float arms placed at right angles with the floats.

Second, a combination of the cog wheels *b'* and *c'*, when acting and being acted upon by cog wheels *d'*, and used with wheels A B and F, substantially as set forth and described.

64,296.—E. P. EDSTROM, Somerville, Mass.—*Horse Collar.*—April 30, 1867.—The roll is formed on a ratan possessed of sufficient flexibility to enable bending it to the desired shape, and sufficient rigidity to keep it normally in shape, or to bring it back to shape after compression or expansion. The roll is stitched directly to the body through its face.

Claim.—A horse collar in which the roll is formed upon a core piece, substantially as described.

Also, in the construction of a horse collar stitching the body part *a*, and the face piece *d'*, of the roll together at the front of the roll, when said body part is drawn over the inner side of the roll and the frame without a seam under the roll, substantially as shown and described.

64,297.—B. M. ESTERLE, San Francisco, Cal.—*Railroad Rail.*—April 30, 1867.—Protuberances on the inner floor of the rail afford inner guides for the wheel flanges and oppose obstacles to the passage of other vehicles with ordinary wheels.

Claim.—The railroad rail provided with alternate inclines A and B, substantially as and for the purposes herein set forth.

64,298.—SAMUEL B. FAY, Franklin, Pa.—*String Tag.*—April 30, 1867.—The pointed metallic tip is run through the cloth and draws after it the cord, which is noosed round the ticket below.

Claim.—The metallic tip *c*, formed with a point at one end and oval at the rear whereby the same may be inserted or withdrawn from the goods when used in combination with the string and tag, in the manner and for the purposes set forth.

64,299.—T. A. and A. F. FISHER, Beardstown, Ill.—*Carriage.*—April 30, 1867.—A spring connecting bar on the carriage is connected by the pointed king bolt and fifth wheel to the front axle, and the coupling rod is jointed to the fifth wheel and swiveled to the brace attached to the body.

Claim.—First, the jointed king bolt H, in combination with the fifth wheel and forward axle and with the spring K attached to the carriage body D, substantially as herein shown and described and for the purpose set forth.

Second, the combination of the jointed coupling rod L with the fifth wheel G, to which its forward

end is attached, and with the brace or arm M, to the lower end of which its rear end is swivelled, substantially as herein shown and described and for the purpose set forth.

64,300.—WALTER FITZGERALD, Boston, Mass.—*Button Hole Cutter.*—April 30, 1867.—The cutter is adjustable over the end of the abutment plate so as to regulate the length of button hole cut.

Claim.—The arrangement of the stationary bed and movable cutter by which increased lengths of cuts are obtained by movements towards instead of away from the fulcrum of the levers carrying the cutters and bed, substantially as described.

Also, the combination with the cutter and its slotted carrier of the adjusting screws by which the edge of the knife is aligned so as to come into contact with the surface of the bed.

64,301.—GEORGE FLINT, Lowell, Mass.—*Parlor Skate.*—April 30, 1867.—The wheeling motion of the skater is facilitated by a middle driving wheel which descends below a line drawn between the other two wheels.

Claim.—The middle wheel or runner *c*, in combination with the wheels *b* and *d*, arranged substantially as herein described and for the purpose fully set forth.

64,302.—T. L. GOBLE, Orange, N. Y.—*Carriage Jack.*—April 30, 1867.—The carriage axle rests on the rail, and is lifted by the operating lever which is pivoted eccentrically to the standard.

Claim.—First, the notched rail E pivoted at one end to the eccentric lever D, and at the other end to the pivoted adjustable stand F, substantially as described for the purpose specified.

Second, the adjustable stand F pivoted to the notched rail E, which is operated by the eccentric lever D, substantially as described, for the purpose specified.

64,303.—J. and W. B. GOFF, Hornellsville, N. Y.—*Gate.*—April 30, 1867.—One of the projecting bars of the gate clamps between the eyebolts attached to the post and is secured by a pin passing through the eyes and a staple on the bar. The other end is secured by an ordinary gate catch with a pin above the bar.

Claim.—The arrangement of the metal eyes *x x*, pin I, and loop J, with gate A, in the manner and for the purposes set forth.

64,304.—CHARLES GOOCH, Cincinnati, Ohio.—*Skate.*—April 30, 1867.—The clamps fit in slots of the foot rest and have pronged upright arms adjusted by thumb nuts.

Claim.—The clamp D, fitting in the holes B of the foot rest A, consisting of the plates F with inclined inner edges and having pronged upright arms G, and adjusted by means of the bolt I and thumb nut J, as herein set forth, for the purpose specified.

64,305.—H. W. GOODRICH and WM. B. MASON, Boston, Mass.—*Steam Engine Slide Valve.*—April 30, 1867.—The valve has a shallow vertical cylinder on its top in which fits a piston secured by a cross-plate to a carriage resting on rollers and connected to the stem. The valve and carriage may be connected by links.

Claim.—The combination of the slide valve, a cylinder, a piston, and a carriage arranged to operate together, substantially as described.

64,306.—CARLOS H. GOULD, Cincinnati, Ohio.—*Steam Generator.*—April 30, 1867.—The upper and under water spaces are connected by a circular series of vertical pipes and an annular water chamber. From the verge of the upper water chamber depends an annular water leg, and the space between it and the water chamber within is supplied with jets of air from perforated pipes. The caloric current passes from the fire space downward in the annular diving flue and beneath the boiler to an open-ended cylindrical damper by whose vertical movement the draft is regulated. The water feed is regulated by a float and weighted lever; the float and lever arms are at right angles to their steam packed pivot which passes diametrically through the boiler shell. An adjustable rod of the lever passes through to the cap of a chamber in the water pipe, and resting upon an elastic dia-

phragm bears it down upon the end of a pipe within said chamber when the float is raised, but allows passage of water when the float is depressed by falling of the water level.

Claim.—First, the annular water space F', communicating in the manner described with a drum or steam box J, and enclosing the fire chamber when combined with the enclosing non-metallic wall P' and bed P having the bottom central ventage U, substantially as set forth.

Second, in the described combination with the elements of the preceding clause, the enclosing air-jacket Z, for the purpose set forth.

Third, in combination with the elements of clause first, the annular descending and centrally discharging flue V, as set forth.

Fourth, the tubular damper 3 in the described arrangement with the flue V and the bottom of the boiler, as explained.

Fifth, the ash spout *k*, arranged and adapted as and for the purpose represented.

Sixth, in the described combination with the elements of clause first, the feed water pipe *f* passing up through the center of the escape flue and of the boiler bottom, as and for the purpose described.

64,307.—D. R. GOULD, Chestertown, N. Y.—*Hydrant.*—April 30, 1867.—The conoid valve has a small groove which allows the waste of water from the discharge pipe to prevent freezing up of the same. The operating lever is worked by a cam.

Claim.—First, the valve F constructed as described and provided with the groove *a* and arranged in connection with the case B and the discharge pipe D, substantially as and for the purpose specified.

Second, the arrangement of the plate *b* supported upon the spring *d* and used in combination with the opening in the bottom of the case B and the stem E, substantially as and for the purpose specified.

64,308.—JAMES S. GRAHAM, Rochester, N. Y., assignor to himself and C. R. TOMPKINS, same place.—*Tenoning Cutter Heads.*—April 30, 1867.—The knives have a circular bed and curved edges whereby a shearing cut is effected. One knife cuts the length of the tenon.

Claim.—The arrangement of the knives or cutters *k*, constructed substantially as shown and described, upon the longitudinally curved bed *a* of the head H of tenoning machines, for the purpose herein set forth.

64,309.—J. GRANGER, Zanesville, Ohio.—*Boat Builders' Platform.*—April 30, 1867.—The platform is pivoted on posts and inclines toward the water while a boat is being lauded or launched, and at other times is tilted into a horizontal position.

Claim.—First, pivoting the tilting platform to the post *a*, so that when the platform is tilted the entire weight of the platform and the boat will rest upon the ground, substantially as described for the purpose specified.

Second, the post A with its inclined shoulders, to which the platform B is pivoted at a distance nearer to its inner end than at the outer, so that when the platform is lowered the weight is upon the ground on the foundation, in the manner as and for the purpose specified.

64,310.—THOMAS GREEN, Brooklyn, N. Y.—*Water Meter.*—April 30, 1867.—The cast-iron cylinder has within it an oscillating piston, valves, and passages. The water flowing through them acts upon a registering apparatus connected with the friction shaft.

Claim.—First, a water meter constructed substantially as and for the purpose herein specified.

Second, the water gate B, the valve C, and the slide rod *m*, in combination with the cylinder A, constructed and operating substantially in the manner and for the purposes herein described.

64,311.—P. S. GREENMYER, Smithville, Ohio.—*Supporter.*—April 30, 1867.—Shoulder and auxiliary straps support the suspended body belt and the two-fold series of straps to which the pessary is attached.

Claim.—The belt A carrying the uterine supporter C with its straps and arms, when used in combination with the shoulder straps D D and their respective

connecting straps, all arranged in the manner and for the purpose specified.

64,312.—ROBERT E. HAINES, Cambridge, Mass., assignor to BOSTON SILVER GLASS COMPANY, Boston, Mass.—*Glass Ware Mold.*—April 30, 1867.—The upper and lower portions of the mold are confined by grooved-hinged clasps, with inclined projections.

Claim.—The employment of hinged clasping bands, constructed and arranged to operate substantially as described, to hold the upper section, when made whole of a glass ware mold to lower sections thereof, when made in parts.

64,313.—L. M. HART, Philadelphia, Pa., assignor to himself and CHARLES S. HINCHMAN, same place.—*Machine for Pressing Tuyeres.*—April 30, 1867.—The carriage supports several molds, which are successively brought beneath the plunger; the carriage is detained by a stop to hold the mold at the proper point for operation.

Claim.—In combination with a traversing core mold a traversing carriage, carrying two or more molds for making tuyeres or other articles of clay or other plastic substances.

64,314.—JOHN HARTMAN, JR., Philadelphia, Pa.—*Skate.*—April 30, 1867; antedated October 30, 1866.—The two swivel clamping plates attached to the rear end of the skate frame act as a fulcrum, and move in a slot. The thumb-screw under the skate frame tightens the forward strap after buckling, and brings together the clamping plates.

Claim.—First, tightening the skate by means of a supplementary plate D, operated by a screw E, substantially in the manner above described.

Second, the combination and arrangement of the the swivel clamping plates F and F', with the sole B, by means of the adjustable fulcrum pin G, substantially in the manner and for the purpose above set forth.

64,315.—STEPHEN C. HENDRICKSON, New York, N. Y.—*Telegraph Insulator.*—April 30, 1867; antedated April 24, 1867.—The shelter is to keep dry a certain portion of the wire, and prevent the escape of the current on the outside of the wire over the insulator.

Claim.—First, a drip insulator, arranged in connection with the gutta-percha coverings of telegraph wires, substantially as described and for the purpose set forth.

Second, the trunk piece G, the bell M, the inverted bell O, the trunk piece P, and the gutta-percha connections at J and Q, constructed substantially as and for the purpose described.

64,316.—ROBERT HITCHCOCK, Springfield, Mass., assignor to JOHN MULLIGAN and JOHN H. HARE, same place.—*Guide for Axle Boxes.*—April 30, 1867.—Detachable guide plates are secured by bolts in the jaws of the axle boxes, so as to be renewed as they become worn.

Claim.—The detachable metallic guide plates B B, provided with flanges *d d* upon their inner edges, and having the wedge-shape projections *b* fitting into the wedge-shaped grooves in the jaws A, when all are constructed and arranged as herein set forth for the purpose specified.

64,317.—WINDSOR HOLDREDGE, Oxford, N. Y.—*Gate.*—April 30, 1867.—The gate is constructed upon the "lazy-tongs" principle. It is operated by weight on the track, which sets in motion a bell crank and push bar. Spring and weight elevate the track, and close the gate by the reverse motion of the same appliances.

Claim.—Connecting the expansible and contractable gate *p q*, with the hinged platforms J J, by means of the descending arms K K, the horizontal levers *l*, the horizontal shaft *m*, the vertical arm *n* and the crooked lever *y*, in such a manner that the depression and elevation of either of said platforms will operate said gate, substantially in the manner herein set forth.

64,318.—PARLEY HOWE, Staffordville, Conn.—*Hand Spring for Machinery.*—April 30, 1867.—The

adjustable spring projects the lever into the notch in the guide, and when it is relieved therefrom draws it home to the frame.

Claim.—The hand spring constructed, arranged, and applied substantially as and for the purpose described.

64,319.—DAVID T. HUBBLE, Bethel, Conn.—*Suspending Lamps.*—April 30, 1867.—The suspending chain passes around a drum containing a coiled spring, which acts to draw up the lamp; a claw engages one of the links for adjustment. The drum is enclosed in a pendent case, which is slotted to admit a side movement of the chain to release it from the claw.

Claim.—First, the arrangement and combination of the mechanism consisting of the drum B, spring D, roller T, claws H and chains C, with frame N, as and for the purpose set forth.

Second, the pendant A, with its central opening and slot I, in combination with the above operating mechanism, as and for the purpose set forth.

64,320.—THOMAS S. HUDSON, East Cambridge, Mass.—*Hand Stamp.*—April 30, 1867.—Improvement on the patent of B. B. Hill, November 6, 1866. Circular type with impression characters on the perimeters and indicating characters on their sides are revolved by the spindles on which they are placed. Holes in the casing expose the characters on the sides of the wheels. The type block indicating the year is locked by a key.

Claim.—First, operating both of the type wheels G H by their spindle I, in the manner and for the purpose set forth.

Second, the type wheels G H, provided with notches *e*, in combination with the spindle I, with its projection *f* and spring *g*, operating substantially as and for the purpose set forth.

Third, the type wheels G H, with the characters marked on their sides, substantially as described, in combination with a casing E, provided with its holes *c d*, substantially as and for the purpose set forth.

Fourth, the key L, or its equivalent, for locking the type block K in place, substantially as described.

64,321.—BENJAMIN IRVING, New York, N. Y.—*Concentrating the Extract of Bark for Tanning and other Purposes.*—April 30, 1867.—The flat worm made of corrugated plates, in which the extract is vaporized, passes through a steam chamber and has a vapor discharge pipe at its upper end and a liquid discharge pipe at its lower end; the pipes are connected with tanks whose upper ends are connected to an exhausting apparatus to assist the flow of the extract and escape of the vapor from the heated coil.

Claim.—The method of process hereinbefore described of treating the extracts of bark for concentrating it by a continuous operation in a vacuum worm or evaporating tables, substantially as set forth.

64,322.—BENJAMIN IRVING, New York, N. Y.—*Machine for Obtaining the Extract of Bark for Tanning and other Purposes.*—April 30, 1867.—The soaked slab of bark is passed between the upper steam heated roller and another roller, through a water trough, and then between the first roller and another one; from thence it drops on an endless apron passing through a shallow tank and delivering the bark to another pair of rollers, the upper one being steam heated.

Claim.—First, the combination and arrangement of the rollers E and D', and D², with the trough F, substantially as hereinbefore described and for the purposes set forth.

Second, the combination of the pipes G² and G³ with the water trough F, for the purposes hereinbefore set forth.

Third, the combination and arrangement of the rollers E and D' and D² with the water box F, and collecting trough J, for the purposes hereinbefore set forth.

Fourth, in combination with the rollers E D' and D², the endless apron P and water box V, for the purposes hereinbefore set forth.

Fifth, in combination with the endless apron P and water box V, the pressure rollers U and U², for the purposes hereinbefore set forth.

Sixth, the combination of the rollers E and V with the steam pipe N², for the purposes hereinbefore set forth.

64,323.—BENJAMIN IRVING, New York, N. Y.—*Obtaining the Extract of Bark for Tanning and other Purposes.*—April 30, 1867.—The bark is passed alternately between the heated pressure rollers and through tanks to extract the tanning liquor, which falls into receivers beneath the rollers.

Claim.—The method of treating bark for obtaining the extract thereof for tanning and other purposes by the process, substantially as hereinbefore described.

64,324.—BENJAMIN IRVING, New York, N. Y.—*Apparatus for Concentrating the Extract of Bark for Tanning and other Purposes.*—April 30, 1867.—The process is, or may be, conducted in the apparatus described under patent No. 64,321, of even date.

Claim.—First, the use of a flat worm made of corrugated sheets or plates of metal, substantially as hereinbefore set forth and for the purposes described.

Second, in combination with a flat worm made substantially as hereinbefore described, a steam chamber or box, for the purposes set forth.

Third, the use of one or more tanks H and I in combination with connecting pipes G and J, and exhausting pipe L, arranged and operating substantially as hereinbefore set forth.

Fourth, the combination of the flat worm made as hereinbefore described, with one or more tanks H and I, by means of the pipes F and K, for the purposes hereinbefore set forth.

64,325.—BENJAMIN IRVING, New York, N. Y.—*Apparatus for Concentrating Extracts from Bark for Tanning.*—April 30, 1867.—The projecting upper end of the coil has a lower branch for the induction of the extract and an upper branch for escape of vapor. The coil is enclosed in a steam chamber, and has an exit pipe at its lower end.

Claim.—The combination of the worms, or of coils of cylindrical pipes, made as hereinbefore described with the steam chamber, for the purpose of concentrating extracts from barks for tanning purposes.

64,326.—CHAS. W. ISBELL, New York, N. Y., and P. W. MCKENZIE, Jersey City, N. J.—*Steam Generator.*—April 30, 1867.—Antedated April 22, 1867.—The sections or tiers of which the generator is composed are formed of rings having projections upon their inner surfaces, which extend nearly to the center of the furnace. The projecting portions are closed at their inner ends, but are open at their outer ends, where they communicate with the surrounding water space, which is otherwise bounded by the outer cylindrical shell.

Claim.—First, the steam generating rings or sections F, constructed with radial finger-shaped tubes H, of tapering or diminishing form from their outer and open ends toward their inner and closed extremities, substantially as specified.

Second, in combination with a series of said rings or sections F, a cylindrical shell or casing inclosing an annular water space B, forming a steam generator with flue spaces b between and around the pockets H, substantially as herein set forth.

64,327.—JOHN JACOBS, Oneida, Ill.—*Self Adjusting Neck Yoke.*—April 30, 1867.—The disk which encompasses the end of the tongue is secured by a swivel plate to a clip on the neck yoke.

Claim.—The swivel loop C and plate B, or their equivalents, constructed substantially as specified and used with a neck yoke, as and for the purpose herein set forth.

64,328.—ABJAH JOHNSON, West Newton, Ind.—*Striking Attachment to Clocks.*—April 30, 1867.—A metallic ring is appended to the arbor of the hour hand with which it rotates. A pin set at any desirable point in said ring trips the end of the striking wire, which for this purpose is turned outward from the striking works through an aperture in the clock face.

Claim.—The ring B placed and figured as shown and perforated for the insertion of pins to operate the striking machinery of a clock, and in combination

therewith the movable pins C, substantially as and for the purpose set forth.

64,329.—S. A. and L. M. KAYS, Independence, Iowa.—*Horse Rake.*—April 30, 1867.—The vibration of the lever presses the forward ends of the teeth and causes them to catch against the ground and rotate the rake head. When the lever is released the spiral spring raises it and its connections to their original positions. By raising the lever the rear bar holds the rake from rotating.

Claim.—First, the lever I and curved bar K, in combination with the rake head F, and pendent lever J, for the purposes and substantially as shown and described.

Second, the spiral spring b in combination with the bar K and lever I, substantially as shown and described and for the purposes set forth.

64,330.—MOSES W. KIDDER and MOSES W. SHOREY, Lowell, Mass.—*Refrigerator.*—April 30, 1867.—The entering air is brought in contact with the pipes containing the outgoing cold air and is thereby cooled, a non-conducting material covering the said passage. When one compartment is opened a valve at the back prevents the cold air from flowing out of the other chamber or the entrance of external air thereto.

Claim.—First, the arrangement of the induction tube B within the eduction tube or passage I, in the manner and for the purpose set forth.

Second, the use and application of valves b and f to the back or either side of each or any of the compartments, said valves being operated by opening and closing the inner doors, substantially as and for the purpose explained.

Third, the combination of the tubes, pipes, or passages arranged for ventilation as set forth, the valves b and f and rods e, with the refrigerator, the whole arranged to operate substantially as and for the purpose set forth.

64,331.—JOHN G. KIMBERLIN, Dryden, N. Y.—*Horse Hay Rake.*—April 30, 1867.—The lever by the driver's seat when pressed forward raises the teeth; on releasing the lever an intermediate spiral spring returns the teeth to effective position.

Claim.—The continuous chain g, provided with an intermediate spring h, in combination with the lever C and rake head C, substantially as described, for the purpose specified.

64,332.—HIRAM KNAPP and WARREN H. PEASE, Goshen, Ind.—*Well Tube.*—April 30, 1867.—The vertically slotted end of the tube has a spiral wire wound upon it, and a covering of gauze outside the wire. The whole is encased in a tubular piece, which is removed after the tube has been sunk to its place.

Claim.—The combination of the slotted tube A, plug F, spiral wire C, screen D, encasing cylinder E, substantially as described, for the purpose specified.

64,333.—A. KOMP, New York, N. Y.—*Quartz Crusher.*—April 30, 1867.—The two revolving crushing rollers are geared together and their shafts carry elliptical cams by which, through anti-friction rollers, the concave faced jaws are oscillated, being connected together by their upwardly projecting arms.

Claim.—The oscillating crushing and grinding jaw E E' in combination with the revolving jaw C C', constructed substantially as and for the purpose described.

64,334.—WILLIAM KRAISS, Fair View, Pa., assignor to himself, JACOB BECKMAN and MYRON SILVERTHORN, same place.—*Beehive.*—April 30, 1867.—The slides limit the entrance passage and are perforated for ventilation.

Claim.—The arrangement of one or more hives provided with chambers P, frames F, lining box H, drawer J, and external slides K, as described, in combination with an external bee house or casing, in such manner as to leave the spaces A B N between the sides, flooring and roof of the hive and the external casing thereof filled with ashes or other poor conductor of heat, substantially as and for the purposes set forth.

64,335.—ISRAEL L. LANDIS, Lancaster, Pa.—*Portable Fence.*—April 30, 1867.—The rails of each panel are pinned to vertical posts and to a diagonal middle brace. The panels are attached by notched boards fitting across the corners in slots in the posts and pinned beyond the rails.

Claim.—The construction of the notched brace E with its pins G, or rod G, when combined or used with a rail or pole fence fastened together with pins B, as herein described and for the purpose set forth.

64,336.—JAMES S. LESTER and LYMAN G. JENKINGS, Lafayette, Ind.—*Derrick.*—April 30, 1867.—For building purposes chiefly; it has a vertically adjustable head-beam and a rotatable head. Brace arms are pivoted to the frame and staked to the ground.

Claim.—First, the combination of the revolving or swinging adjustable frame D E F, with the vertical post or cylinder A, substantially as herein shown and described.

Second, the combination of the revolving pulley bore G, with the vertical post or cylinder A, substantially as herein shown and described.

Third, an improved derrick formed by the combination of the pulley box or frame G, the adjustable frame D E F, the vertical post or cylinder A, and the adjustable braces B, with each other, substantially as herein shown and described.

Fourth, connecting the ropes J K, and pulleys H I, with each other, with pulley box or frame G, and with the swinging frame D E F, in such a way that one of the platforms attached to said ropes may be raised at the same time and by the same operation by which the other is lowered, substantially as herein shown and described.

64,337.—THOMAS LING, New York, N. Y.—*Pump.*—April 30, 1867.—The pump cylinder is moved up and down by means of a handled lever, the motion being assisted by the pressure of the foot upon the end of a bar the lower end of which is attached to the cylinder.

Claim.—The bar G, brakes K K', one or more, and bar E, arranged and applied to a rising and falling pump body, substantially as and for the purpose herein set forth.

64,338.—T. JONES and W. MORGAN, Pittsburg, Pa.—*Compound for Improving the Quantity of Iron.*—April 30, 1867.—To 500 lbs. of pig metal boiling in a common furnace, add 7 oz. manganese, 1 lb. common salt, 2 oz. copperas, 3 oz. potash, and 1 oz. salt-peter.

Claim.—The use and application of the above described compound, for the purpose set forth.

64,339.—SIMON F. MACKIE, New York, N. Y.—*Mill for Crushing Ore.*—April 30, 1867.—The stamps work upon a bed which is surrounded by a screen through which a current of water passes. The stamps have cylinders in their upper ends, the piston rods of which are connected to the cranks, the confined air forming a pneumatic spring to relieve the machinery from strain.

Claim.—First, the combination of the cylinder stamp heads *a*, covers *c*, pistons *f*, piston rods *g*, cross-heads *y*, connecting rods *r*, crank shaft *x*, and guides *u*, with the bed *k*, and screen *l*, substantially as herein described, and for the purposes herein set forth.

Second, the plate *z*, in combination with the flanged stamp head as described.

64,340.—G. B. MANLEY, Cogan's Station, Pa., assignor to himself and TIMOTHY O. VAN ALEN, Danville, Pa.—*Lattice and Truss Bridge.*—April 30, 1867.—The braces and string pieces have double-edge flanges, and at the intersections the flanges are notched out to the web to receive the flanges of the string pieces; the braces are also notched at their intersections. Between the parallel string pieces are blocks fitting their inner sides and traversed by transverse bolts.

Claim.—First, the method and arrangement of interlocking the wrought-iron strings and braces of a lattice-work truss for bridges, in the manner herein described.

Second, the brace block D, in combination with the grooved and ribbed beams of strings A and C, fitted

and secured between them, as and for the purpose herein described.

64,341.—S. MARKEE, Auburn, N. Y., assignor to himself and JOHN M. EASTERLY, same place.—*Plane Iron.*—April 30, 1867.—The curved cup is attached to the plane iron by the screw and flanged sliding nut which fits in the slot of the iron.

Claim.—The plane iron consisting of the slotted iron A, curved cap C, flanged sliding nut D, and screw B, arranged and operating substantially as described for the purpose specified.

64,342.—GEORGE B. MARKHAM, Plymouth, Mich.—*Knife Sharpener.*—April 30, 1867.—The beveled grindstone is hung in a metallic frame and attached with a set screw to a bench. The guide rest is attached to the frame branch by the slotted arm.

Claim.—The adjustable guide rest *e*, attached to the frame branch *b*, by an arm *d*, when constructed as described and arranged in relation to the beveled grindstone A and its metal supporting frame, as herein set forth for the purpose specified.

64,343.—EDWARD G. MARKLEY, Sunbury, Pa., and GEORGE H. BARDWELL, Philadelphia, Pa.—*Manufacture of Fuel from Anthracite Coal Dust.*—April 30, 1867.—Composed of coal dust, 85 per cent. and 15 per cent. of a mixture of pitch, petroleum, saltpetre, starch, and water. Mold into blocks under heavy pressure.

Claim.—The improved anthracite block as above described and set out, made of the materials combined in substantially the proportions above set forth.

64,344.—ISAAC D. MATHEWS, Worcester, Mass.—*Hanger and Journal Box for Shafting.*—April 30, 1867.—The hanger has a vertically adjustable bracket, whose upper concave surface engages the convex part of the box. The box is adjusted by set screws in the upper and under projections of the hanger.

Claim.—First, the combination of the main part A, having a slot *g*, projections *b* F, screw bolts D G and *e*, with the bearing piece E and box C, said parts being constructed and arranged for joint operation, substantially as and for the purposes set forth.

Second, the combination of screw *c* and cap *d*, with the journal box C and projection *b* of the hanger part A, substantially as and for the purpose set forth.

Third, the combination with the concave bearing part E and cap *d*, having projections *n e*, as shown, of the journal box C, having slots or recesses *f f*, for the purposes set forth.

Fourth, the combination of nut *h* and screw G, with the projection F, and oil or drip-pan H, substantially as set forth.

64,345.—ANDREW J. MARTIN, Rockford, Ill.—*Harvester Rake.*—April 30, 1867.—The rake teeth are held to their pendent position by a spring, except when passing over one of their operating arms. The rake bar is pivoted at the inner end to a revolving lever, and a similar lever has play in a longitudinal vertical slot of the bar. The rake is swept around in an irregular revolution. The actuating bevel wheels of these arms are concave elliptical on their faces to give the proper relative speeds to the arms at all parts of the stroke.

Claim.—First, driving an automatic rake by a series of concave elliptic bevel gears, substantially in the manner and for the purpose described.

Second, the combination of a slotted rake arm moving horizontally over the platform, with two crank arms, arranged one behind the other, and driven by elliptic gearing, substantially in the manner and for the purpose described.

Third, the combination of the recessed pinion E with the loop *e*, when arranged and operating as described to throw the rake into and out of gear.

Fourth, the combination of the rigid rake head T with the yielding teeth, when arranged and operating as described.

64,346.—C. S. MARTIN, Milwaukee, Wis.—*Dray.*—April 30, 1867.—Rubber springs are placed between the guide plates, and vertical slide jaws are strengthened by braces.

Claim.—A dray, constructed with springs of india

rubber D, placed between the guide plates E, attached to the axle C, and vertically sliding jaws B, attached below the body A, and strengthened by braces G, said parts being combined and arranged substantially as described.

64,347.—HELEM MERRILL, Philadelphia, Pa.—*Using Steam for Heating and Evaporating.*—April 30, 1867.—The water of condensation flows into a water vessel, from which the air escapes through a cock at top, and a float within opens a cock, which allows the water to be forced from its bottom to a similar vessel above the water level in the boiler; this vessel, when filled, opens communication with the boiler, and the water flows into it. The floats operate on the exhaustion of water in the vessels to close the cock.

Claim.—First, the retaining of the water in the receiving and discharging cylinders until at required height it exerts a power sufficient to perform the operations substantially as described and set forth.

Second, the independent float as connected and combined with the stop cocks, making the whole apparatus self-acting, for the purposes substantially as set forth and described.

Third, the method of returning the water of condensation to the boiler, substantially as described.

64,348.—J. W. MYERS, Lyons, Iowa.—*Churn.*—April 30, 1867.—The cream entering the cylinder through the funnel is forced through its perforated side plate by centrifugal force; a stationary breaker in the middle facilitates the projection, and the process is completed by the slat dashers below.

Claim.—First, the stationary breaker H.

Second, the revolving perforated cylinder L R J K.

Third, the combination and arrangement of these parts in connection with the other parts, when constructed and operating substantially as and for the purpose set forth.

64,349.—WILLIAM NASH, Corning, N. Y.—*Hay Rack.*—April 30, 1867.—The frame has vertical slats attached at suitable distances, and horizontal longitudinal slats on the bottom above the seed drawers. There are troughs to the sides for preserving stray hay, and for feeding grain and roots.

Claim.—First, the drawers F F, placed so as to be drawn out at the ends from under the longitudinal slats *d d d*, which form the support for the hay in the rack, the drawers F F being so arranged as to receive and save the grass seed, after it is liberated from the hay in feeding, substantially in the manner and for the purposes herein described.

Second, the combination for the side troughs E E, hay rack B and drawers F F, constructed and operating substantially as and for the purposes herein set forth.

64,350.—ADAM NEER, Bellefontaine, Ohio.—*Gravel Wagon.*—April 30, 1867.—The wagon is run back to dump the load, and again run forward by ropes operated by reels on the fore end of the bolster frame.

Claim.—First, the combination of the rope L, pulleys M and O, reel or drum I, and crank R with each other, and with the box I and frame F, substantially as herein shown and described, and for the purpose set forth.

Second, the combination of the rope S, pulley T, reel or drum U and crank V with each other, and with the box I, and frame F, substantially as herein shown and described and for the purpose set forth.

64,351.—J. A. NIMAN and B. FIDLER, Mansfield, Ohio.—*Machine for Bending Tires.*—April 30, 1867.—The combined right and left-hand screws are held in position by their central collar, and slide the carriages conveying the rollers, regulating them to the curve of the tire.

Claim.—The right and left-hand screw I, provided with a collar II, working in a recess in the bed of the machine, combined with the sliding or traversing roller carriages E, which carry the rollers B, which said screw is tapped or screwed into and through the said roller carriages F, and by means of which said combination we are enabled to set the rollers B equidistant nearer to or further from the central roller A, for the purpose required, and retain them in place, all

of which is substantially set forth, described, and shown in the accompanying drawings and in this specification.

64,352.—GEORGE NIMMO, Jersey City, N. J.—*Manufacture of Fire Brick.*—April 30, 1867.—Coal ashes are used, combined with clay as furnace lining.

Claim.—The employment of the residuum of the combustion of coal as the base or principal component in the manufacture of fire bricks, retorts, furnace linings, pots, and similar articles, as and for purposes specified.

64,353.—E. W. NOHL, Ripon, Wis.—*Manufacturing Metals, Glass, and Pottery.*—April 3, 1867.—Explained by claim.

Claim.—The manufacture of metals from the ore, without the usual mixture with the latter of coal or other solid face by the means of the combustion of gas, generated for the purpose, and brought directly into the furnace, and burned in combination with a blast of air, substantially in the manner and for the purposes set forth.

64,354.—WILLIAM NUGENT, North Providence, R. I.—*Picker Motion for Looms.*—April 30, 1867.—

The object is to prevent the rocker from jumping out of its place in the rail, and to construct the whole so that when the picker strikes the shuttle it will not cause the latter to jump or tilt so as to bring its nose against the warp. The picker is adjusted by a longitudinal slot in the rail and has free rocking motion to an extent determined on one side by the length of slot in its pivot block, and on the other side by a pin in an arm of the block.

Claim.—First, the rail A provided with cavity I, in which plays the pin of the arm I, of the slotted block G, which carries the staff C and rocker E, and having horizontal slot L, through which slot and the vertical block of the slot G plays the bolt F, encircled by the sleeve a, and operating in the manner herein represented and described.

Second, the cavity I in the side of the rail A, in combination with the block G, whose arm J has a pin that works in said cavity, substantially as shown.

64,355.—R. J. NUNN, Savannah, Ga.—*Steam Generator.*—April 30, 1867.—The generator is constructed of tubes in successive series; those around the furnace are protected from the intense heat of the fire, and the series is so arranged that any one of the series can be stopped off from the rest and removed for renewal or repairs without disturbing the remaining ones.

Claim.—First, steam generator or boiler constructed entirely of tubes or pipes when such tubes or pipes are arranged and connected together and protected from the direct action of the fire, substantially in the manner herein described.

Second, the interior circulation tubes herein described when the said tubes are perforated in the manner and secured in their position in the manner substantially as described when used in the vertical tube of a boiler, as and for the purposes set forth.

64,356.—SAMUEL J. PARKER, Williamsport, Pa.—*Automatic Boiler Feeder.*—April 30, 1867.—

The water tank has a partially tubular vertical stem ending in a pipe at the water level in the boiler. This stem has a sliding sleeve with a surrounding water chamber supported by a weighted lever. When raised the chamber communicates with the tank through the sleeve; when full the chamber falls and communicates with the boiler, exchanging water for steam; it again raises as soon as the water level is low enough to bare the end of the pipe.

Claim.—First, the within described arrangement of the vessel C with the tube D and fixed pipe M, in combination with suitable packing e and a, boiler and a water tank, substantially in the manner and for the purposes herein set forth.

Second, in combination with the above the arrangement of the passages d relatively to the movable part C, adapted to discharge steam from beneath the packings e, substantially in the manner and for the purpose herein set forth.

64,357.—WILLIAM F. PARKER, Andover, Mass.—*Drilling Machine.*—April 30, 1867.—The drill is fed

by a center screw which engages a socket screw of the shaft, the ratchet collar of the screw being intermittingly engaged by a cam and rotated in the shaft; a cam ring raises the pawl from the ratchet wheel during the greater part of the revolution.

Claim.—The combination of the pawl N with the ratchet wheel K, the cam M, and the slide P, for the purposes herein set forth and described.

In combination with the subject-matter of the foregoing clause and with the supporting frame I, the top piece *a*, arranged as described.

64,358.—HORACE L. PERRY, Aurora, N. Y.—*Gang Plow.*—April 30, 1867.—The adjustable frame carrying the gang of plow shares is hinged to the forward end of a carriage whose wheels, of unequal diameter, traverse in the furrow and on the land respectively. Racks hinged to the plow-frame and pinions on a shaft having bearings on the main frame are the means of vertical adjustment.

Claim.—First, the cast-steel plow D, when constructed and used in combination with the hinged plow-frame C, main frame A, and wheels B B, for the purposes and substantially as herein described.

Second, the combination and arrangement of the pinions E E, crank shaft F, hinged racks G G, ratchet wheel H, and stop lever II, for the purposes and substantially as herein set forth.

64,359.—OLIVER PERRY, W. N. WELLES, and CLARK PERRY, Ortonville, Mich.—*Sheep-shearing Table.*—April 30, 1867.—The adjustable extension tables are pivoted to the frame below, and actuated by a treadle secured by a ratchet bar. A cord and loops on the table fasten the sheep.

Claim.—The combination and arrangement of the table A, swinging frames B B, rope g, and treadle C, all constructed and operating in the manner substantially as and for the purposes herein specified.

64,360.—NICOLIA PETERSEN, Columbus, Miss.—*Musical Dial.*—April 30, 1867.—The dial exhibits the names and distances of musical tones in a circle; the scales are distinguished by different colors, and a movable dial combined with the stationary one assists in setting the device for different notes.

Claim.—First, a musical dial substantially as and for the purpose described.

Second, the combination of the movable dial B with the stationary main dial A, as and for the purpose set forth.

64,361.—GEORGE W. PORTER, Boston, Mass.—*Apparatus for Carburetting Gas and Air.*—April 30, 1867.—The fibrous material is held between two perforated plates brought together by a thumb-screw, rendering it more dense and impeding the passage of gas through it. Openings may be made in the middle partitions by hooks operated by thumb-screws outside of the vessel. The hooks are kept in position by spiral springs.

Claim.—First, the construction and arrangement of the hooks in the side of the box A, their inner ends, pointing in opposite directions, retained by means of the spiral springs J, and capable of being adjusted whereby a breach is made in the capillary substance, as and for the purpose specified.

Second, the construction and arrangement within the box A of the perforated plates, adjusted by means of the thumb-screw *a*, whereby the capillary substance is compressed or released, as herein set forth, for the purpose specified.

64,362.—THOMAS L. REED, Providence, R. I., assignor to ATLANTIC TUBING CO., same place.—*Flexible Tubing or Hose.*—April 30, 1867.—A coil of wire is covered with a braided tube of cotton thread, which is coated with a varnish of linseed oil, sulphate of zinc, sugar of lead, and camphene. Over the tube thus formed a rubber tube is secured to prevent the varnish from cracking.

Claim.—The flexible impervious tubing formed by combining the non-collapsible tube with a sheath or tube of india-rubber, or other vulcanizable gums or compounds, by the means and substantially as described, for the purpose specified.

64,363.—WALTER REED, Wayne, N. Y.—*Fence.*—April 30, 1867.—The panels are supported by in-

clined struts, which intersect between the upper two rails and are united by a notched cross brace near the surface of the ground.

Claim.—An improved fence formed by the combination of the stakes C and D and lock-bar E with each other and with the panel or panels of the fence, substantially in the manner herein shown and described and for the purpose set forth.

64,364.—T. C. RICE, Worcester, Mass., assignor to THOMAS H. DODGE and T. W. WELLINGTON, same place.—*Apparatus for Heading Wrench Bars.*—April 30, 1867.—The bed is reciprocated by rack and pinion, and the head of the blank subjected to the pressure of a roller above. The bed has depressions of different shape, which form dies in which the head is successively pressed, its shank extending down through holes in the bed.

Claim.—First, the combination of the sliding table C, perforated in the manner described, with the horizontal rolls H H, for reducing the head of the wrench to the proper thickness, substantially as set forth.

Second, the combination of the grooved table or bed C, perforated in the manner described, with the vertical friction roll K, for reducing the head of the wrench to the proper depth, while the sides are prevented from lateral expansion, substantially as set forth.

Third, the combination of the friction roll K with the grooved table or bed C, provided with the inclined hole *h*, for reducing one part only of the head and giving it the proper inclination, substantially as set forth.

Fourth, the combination with the friction roll K of the grooved table C, when provided with the inclined hole or perforation *h*, notch *z*, and pit *u*, for receiving the surplus metal, as set forth.

Fifth, the combination in the sliding table C of the hole *g* with the sides *o o* and projection *p*, substantially as and for the purposes set forth.

Sixth, the combination of the perforated table C, for holding the wrench head in different positions, with the friction rolls and the rack and gear, or other actuating mechanism, the whole being arranged and operated to reduce and shape the wrench head, substantially in the manner herein specified.

64,365.—EDWARD RICHMOND, Brooklyn, N. Y.—*Whip Rack.*—April 30, 1867.—The bracket plate has openings with pierced diaphragms of rubber, through which the handle is thrust. Adjustable hooks are attached to slots in front and accommodate themselves to the same purpose.

Claim.—First, the wedge-shaped opening formed in a rack, as described, of a hook or guide of metal, or other suitable material, secured in the said rack under such an arrangement that the portion of the said hook, which guides and maintains the whip lash or tip in its proper relation to the opening, shall be parallel or nearly so with the face of the rack, and transverse to the length of the opening over which it is placed, substantially as shown and set forth.

Second, the combination with a wedge or V-shaped slot, formed on the edge of whip rack, of adjustable guide or hook, corrugated or bent at the point where it traverses the slot, above which it is placed, and pivoted to the top of the rack, so that it may be moved to lessen the width of the said slot, substantially as and for the purposes shown and described.

64,356.—EDWARD RICHMOND and JOSEPH G. MOODY, New York, N. Y.—*Ticket Safe and Alarm Bell.*—April 30, 1867.—Explained by the claim and illustration.

Claim.—First, the ticket safe or receptacle, the same consisting of a box slotted to admit of the insertion of the tickets, and provided with a door in which openings are formed, and an inside leaf or plate held against the door by means of spring, the said door and spring leaf being held to the box in such manner as that the tickets when inserted through the said slot may be securely held between them, as herein shown and set forth.

Second, the combination with slotted box or safe of the hinged door and inside spring leaf or plate having formed on their upper ends flanges or lips which overlap each other, so as to prevent the withdrawal of the tickets placed within the said box, substantially as herein shown and described.

Third, the combination with the herein described ticket safe of an alarm bell attached to said safe, substantially in the manner and for the purpose herein shown and specified.

64,367.—JOHN L. RITER and R. C. SWANN, Brownsville, Ind., assignors to themselves, T. J. WEST and R. B. PERRY, Union county, Ind.—*Churn*.—April 30, 1867.—The eccentric wrist pin runs in a slotted plate secured to the churn and swings the latter on its centers.

Claim.—The arrangement of the shaft and fly-wheel E with plate G, having a pin Z near its periphery, which works into a slotted plate *d* upon the side of the churn C, for operating said churn box upon its bearings, as herein set forth.

64,368.—SILAS ROGERS, Stamfordville, N. Y.—*Thill Coupling*.—April 30, 1867.—The shackle plate in front of the axle clip is curved in front, agreeing to the sweep of the thill, and has a slot in it which receives the spindle of the thill iron.

Claim.—A thill coupling composed of the plate C, attached to the lip A, and having a curved front end, and the thill iron D provided with a slot *c*, and connected to the plate C by means of a groove and pin, arranged as shown and described, or in an equivalent way.

64,369.—H. ROSENTHAL, New York, N. Y.—*Paint Brush*.—April 30, 1867.—The ferrule which encompasses the butts of the bristles is riveted or screwed to the flange of the socket plate.

Claim.—The combination of the ferrule C, socket plate or disk E, handle B, and bristles A, when the latter are secured together, substantially as set forth.

64,370.—ANSELL P. ROUTT, Liberty Mills, Va.—*Cultivator*.—April 30, 1867.—The adjustable and reversible share is secured by loop and key upon the curved sheath whose point enters a hole in the back of the shovel to steady it.

Claim.—The changeable, reversible, and adjustable share secured by loops G and keys or wedges *h* upon the curved sheaths or shanks C, whose points enter the holes or notches in the shovel or plow to secure and steady it in any position in which it may be adjusted, substantially as set forth.

64,371.—T. J. V. ROZ, Paris, France.—*Piano-forte*.—April 30, 1867.—This orphean piano has elementary, *soft*, *leggio*, *transposing*, and accompanying key-boards, divided into graduated classes or separate progressive degrees, for instruction in the piano-forte or organ; the large key-board, which is also fitted with *transposing* and accompanying movements, forms the last class.

Claim.—First, the construction of the back or bottom of the piano of round or oval columns F, in combination with an iron frame *a* and bars A, and the bar *b*, as and for the purposes specified.

Second, the piano action composed of the levers O, lifter *o*, and lever O' applied in the manner specified, so that the same shall be separate from the key-board, in order that one key-board may be moved away and another brought into place, as set forth.

Third, the anti-friction supports J L, winch 9, cord 16, and tightening screw I', in combination with the *transposing* key-board 1 and rack 17, for moving said key-board with facility and retaining it in place, as set forth.

Fourth, the small or elementary key-boards fitted so as to be movable and applied in the manner specified, to act upon the same notes as the main key-board, as and for the purposes specified.

Fifth, the cards connected with the respective notes and raised by the depression of the note so as to exhibit the name and sound of the particular note to aid in the instruction of elementary music, as set forth.

Sixth, a series of levers composing the action between the keys and hammers, said action connecting on one line with the keys and lengthened downwards at the bass end, and projected upwards at the treble end, the intermediate connections being graduated so as to reach the hammer above the notes at the treble end and below the notes at the bass end, as specified.

64,372.—CYRUS W. SALADEE, Newark, Ohio.—*Door Spring*.—April 30, 1867.—The arm is adjustably pivoted on the door jamb and its outer end impinges upon a spring plate in the cylinder on the door.

Claim.—First, the box or cylinder A secured rigidly to the door or gate in combination with the arm B and standard D, in the manner and for the purpose substantially as shown and described.

Second, the arm B, constructed and operating in the manner and for the purpose substantially as shown and described.

Third, the standard D, or its equivalent, when provided with a series of bearings or holes 1, 2, 3, Fig. 3, in combination with the arm B, substantially as and for the purpose specified.

Fourth, in combination with the arm B, the indentation *z*, substantially as and for the purpose described.

Fifth, the combination of the adjustable arm B, standard D, follower E, spring C, and the box or cylinder A, or their equivalents, arranged and operating in the manner and for the purpose substantially as shown and described.

64,373.—EDWIN M. SCOTT, Auburn, N. Y.—*Starting and Stopping Street Cars*.—April 30, 1867.—Pulling one lever throws the rack into engagement with the small pinion and condenses the spring. Pulling on the other lever throws the rack in engagement with the larger gear wheel to rotate the axle and assist in starting. Pulling both levers simultaneously checks the car.

Claim.—First, the fixed pinion *c* in combination with gear *d* and slotted racks *e f*, as and for the purpose specified.

Second, in combination with the above, spring E, elbows *h h*, and levers *i i*, all arranged as and for the purpose set forth and described.

64,374.—JONATHAN F. SHOEMAKER, Van Wert county, Ohio.—*Photographic Printing Frame*.—April 30, 1867.—The back of the printing board is in four sections, which are fastened by staples and hooks, and may be raised one at a time. The face has flaps of cloth by which the likenesses may be covered up or exposed singly.

Claim.—The folding-back photographic printing frame, substantially as herein described.

64,375.—C. LATHAM SHOLES, Milwaukee, Wis.—*Machine for Printing Numbers*.—April 30, 1867.—For printing numbers consecutively by the use of rotating disks having the numbers on their peripheries; they have a positive motion, and are arrested at a given point by a locking bar so as to straighten the line.

Claim.—First, the disks E, provided with the dogs *r* and projections *e'*, in combination with the plate *d*, when arranged to operate as and for the purpose set forth.

Second, operating the disks E by means of the projecting pins *t* and the cam *c*, arranged to operate as shown and described.

Third, aligning the disks E by means of the V-shaped notches and the locking bar *x*, operating substantially as set forth.

Fourth, the sliding bar *z*, with its spring *m* and the oscillating cam or guide *a*, when said parts are arranged for joint action, substantially as herein set forth.

64,376.—GEORGE SPRAGUE, Spring Hill, Kansas.—*Corn Cultivator*.—April 30, 1867.—The cutters sever the roots ahead of the shovels, which can be adjusted to throw the dirt either way. A swing frame in reach of the driver adjusts the beam to which the cutters and shovels are attached.

Claim.—The combination of the root cutters F F, the shovels *d d*, and the plow beams E E, arranged and connected for adjustment and operation, substantially as and for the purposes herein described.

64,377.—W. G. and C. STERLING, New York, N. Y.—*Lantern*.—April 30, 1867.—Horizontal segmental pieces are attached to the lower ends of the guard wires, pass beneath lugs on the base, and are held by spring catches.

Claim.—The guards A A, attached to the circula

part B, in combination with the catch D or lugs G G, or their equivalent.

Also, the eyelet clamps, Fig. 3, when used for the purpose above described.

64,378.—S. G. STEVES, Jamestown, N. Y.—*Car Truck*.—April 30, 1867.—The car frame is suspended from the axle boxes, and is trussed by a tension rod below and braces and chord above.

Claim.—The car truck frame A, in combination with the braces J J', chord H, and tension rod K, and so constructed that the sides of said truck form a truss by which it is suspended below the axles, in the manner and for the purpose substantially as set forth.

64,379.—H. M. STOKER, Watson, Ill.—*Fence*.—April 30, 1867.—The boards are nailed to the pointed posts, and the latter lock against each other and are united by through pins. Inclined struts brace the fence laterally.

Claim.—The two-fold adjustability of the posts of the panels L and H, in combination with bars E, connecting pins t, and binders C, and pointed posts A, the whole constructed, arranged, and operating in the manner and for the purpose substantially as herein set forth.

64,380.—JAMES B. STUART, Bunker Hill, Ill.—*Fifth Wheel for Wagons*.—April 30, 1867.—Two segmental plates are attached to the axle and to a pivot on a curved bar in front of the axle. A second frame pivoted with the other is attached to the bolster and has segments sliding on those of the frame below.

Claim.—A circle plate or fifth wheel for vehicles, composed of the frame A and plate B connected by a bolt d and attached respectively to the front axle and bolster, substantially in the manner as and for the purpose herein set forth.

64,381.—F. F. TERRY, Port Gibson, N. Y.—*Shank and Socket for Hand Hay Forks*.—April 30, 1867.—The ferrule has a block of metal which is drilled to receive the tines which may be retained by one transverse pin.

Claim.—First, locking the several tines t to the shank or head S by a single key, substantially in the manner herein shown and described and for the purpose set forth.

Second, providing the head or shank S with round holes to receive the wire tines t, as and for the purposes shown and described.

Third, the arrangement of the handle socket or ferrule C in connection with the receiving shank S, as and for the purpose herein set forth.

64,382.—WILLIAM THOMPSON, Cleveland, Ohio, assignor to the CLEVELAND GAS MACHINE COMPANY, same place.—*Gas Generator and Carburetter*.—April 30, 1867.—The air is forced by the vibration of two closed chambers immersed in a water tank. The carburetting liquid is carried up by revolving buckets and the interior of the carburetting vessels is warmed by steam generated by a lamp.

Claim.—First, the corrugated cylinder C, annular chamber e, as arranged, in combination with the chains f and buckets g, for the purpose and in the manner as described.

Second, the heater S, burner V, pipe Q, in combination with the carburetter W, case P, and gasometer Y, for the purpose and in the manner as set forth.

Third, the cylinder C, diaphragm F, valves I and K, in combination with the generator B, for the purpose and in the manner substantially as described.

Fourth, the pipe j, sleeve h, in combination with the corrugated cylinder C, for the purpose and in the manner specified.

64,383.—E. P. and E. S. TORREY, New York, N. Y.—*Weather Strip*.—April 30, 1867.—A strip of rubber is secured in a kerf of the molding, which is then ready to be attached to a door, (or other object;) the latter, in closing, brings the protruding portion of the rubber against the threshold or casing and closes the crack.

Claim.—First, a weather strip formed of a single piece of molding as herein described and shown in Fig. 5 with a strip of india-rubber or other suitable material, applied therein, as specified, for covering

joints on level surfaces, substantially as above specified.

Second, the weather strip shown in Fig. 6, for guarding joints in angles, constructed as and for the purpose herein set forth.

64,384.—GEORGE W. TOWNSEND, Galesburg, Mich.—*Stump Extractor*.—April 30, 1867.—The frame is on runners, is anchored at one end, and its draw bar has cavities for the engagement of two draw bars, connected to cranks on a shaft driven through gearing by a rope on a drum. The slack of the rope is wound upon another drum.

Claim.—The pulleys a and a', arranged substantially as herein shown and described, in combination with the draught bar C and pitmans E.

Also, the double crank shaft D, the gear wheel F, and pitman H, in combination with the draft bar C and pitmans E, substantially as herein specified.

64,385.—ALÖIS POHR VON PÖHRNHOF, Brooklyn, N. Y.—*Manufacture of Bicarbonate of Soda*.—April 30, 1867.—The hydrate of soda, precipitated during the evaporation of solutions of soda ash, is exposed to the action of carbonic acid gas, and the steam generated by passing the hot gas through water as it comes from the flues.

Claim.—A process of manufacturing bicarbonate of soda without admixture of crystal of sal-soda from hydrate of soda, and as such alone without submitting the latter to a previous procedure, and through the simultaneous influx of carbonic gas and water, steam created by said gas for the purpose and in a manner substantially as described above.

64,386.—EDWARD L. WALKER, Jenner's Cross Roads, Pa.—*Washing Machine*.—April 30, 1867.—The reciprocating compressor is beneath the clothes and presses them against the lid, which is adjustable and attached by spring pins that enter holes in the ends of the machine. The compressor is operated by a lever frame and two sliding side pieces.

Claim.—First, the movable cover, or its equivalent, against which the compression of the clothes is effected substantially as described.

Second, the compressor operated from beneath against the stationary or adjustable cover or its equivalent, substantially as described.

Third, the box or tube provided with a series of sockets or their equivalents, for graduating or adjusting the height of the removable top or cover, substantially as described.

Fourth, the arrangement of means for operating the lifting compressor, consisting of uprights attached to said compressor, pivoted fulcrum standards, and the lever frame, or their equivalents, substantially as described.

Fifth, a compressing cover provided with a rubber board on its under surface, and arranged to turn on pivots over against the side of the frame, in the manner and for the purpose described.

64,387.—WILLIS WEAVER, Salem, Ohio.—*Carpet Stretcher*.—April 30, 1867.—The looped wire proceeding from the lever is engaged over a tack head, and the toothed plate engaged with the carpet, which is drawn forward by a movement of the lever, and secured by the clawed staple whose bend is placed over the head of another tack.

Claim.—First, an improved carpet stretcher, formed by the combination of the pivoted tooth plate B, pivoted wire loop C, or equivalent, and lever A, with each other, substantially as herein shown and described.

Second, the combination of the spring E, with the pivoted tooth plate B, and lever A, substantially as herein shown and described, and for the purpose set forth.

64,388.—T. L. WEBSTER, Brooklyn, N. Y.—*Holder for Slotting Tools*.—April 30, 1867.—The holder has a joint by which the tool is allowed to fall back when the end pressure is removed, and to compress the spring which presents the tool properly at the next stroke.

Claim.—The tool holder for slotting machines, constructed as described, consisting of the parts a b, fitted together and connecting by the pin c, to form a joint which will admit of the slotted part b, moving

only in one direction, spring B, fitted in the recess *c*, of the part *a*, substantially as herein shown and described.

64,389.—SAMUEL K. WELLMAN, Nashua, N. H.—*Manufacture of Fire Brick.*—April 30, 1867.—Composed of pulverized "diamond rock" 35, fire sand 15, and fire clay 50 parts, molded and burnt in the usual manner.

Claim.—The use of a diamond rock in the manufacture of fire bricks, furnace linings, and similar articles, substantially as described.

64,390.—JOHN D. WELLS, Franklin county, Ohio.—*Corn Planter.*—April 30, 1867.—The dropper is operated by a connecting rod attached to a slide at one end, and at the other to a crank on a driving wheel; a plow opens the ground and a roller covers the corn and mashes the clods.

Claim.—The application of a driving wheel with a crank attached for operating the valves, together with the arrangement and particular combination of the several parts named as above described, or substantially the same as would answer the intended purpose.

64,391.—HORATIO WHITING, New York, N. Y.—*Dividers.*—April 30, 1867.—The segmental guide on one leg has a rack which is engaged by a circular nut in a slot of the other leg.

Claim.—The construction and arrangement of the annular flanged screw nut F, provided with a screw thread upon its inside, and hung in the slot E, in the leg B, upon the arm D, the latter provided with teeth upon its upper side and passing through the slot in the leg B, at right angles with the slot E, the said screw nut being held in place by means of the spring G in the slot E, substantially as described for the purpose specified.

64,392.—ELIJAH WILLIAMS, Marianne, Florida.—*Propelling Boats.*—April 30, 1867.—The paddles are rotated by two pawl levers through intermediate gearing.

Claim.—First, the combination of the pawls O O with the springs P P, and the driving wheels F, the pinion wheel E, the ratchet wheel D, and the paddle wheels B B, all constructed and operated substantially in the manner and for the purposes hereinbefore set forth.

Second, in combination with the above, the method of elevating and depressing the paddle wheels by means of a platform operated by adjustable screws and blocks, substantially in the manner and for the purposes above set forth.

64,393.—GEORGE L. WITSL, Philadelphia, Pa., assignor to ELIZA SIBBET and JOHN C. CROMPTON.—*Churn.*—April 30, 1867.—The spiral opening in the rod is traversed by a guide pin in the lid, which gives a reciprocating rotary motion to the dasher as it is moved vertically by power applied to the revolvable head.

Claim.—First, the dasher handle E, when constructed with a spiral opening entirely through the same in combination with the pin B, for giving an alternately rotary motion to the dasher, with the vertical reciprocating action of the handle substantially as described.

Second, the combination of the concavo-convex dasher C, with triangular openings and radial flanges D, having angular notches in their ends, with a device for giving a reciprocating vertical and alternating rotary motion to the dasher, substantially as and for the purpose set forth.

Third, the combination of the dasher handle E, constructed as described, and the cross-piece G, when arranged to operate substantially as set forth.

64,394.—SYLVESTER J. WRIGHT, Ellsworth, N. Y.—*Automatic Gate.*—April 30, 1867.—The depression of the track actuates the lever below, which is connected by a chain which passes round the pulleys and to the gates above to open them.

Claim.—First, the combination of the rollers C, flexible straps D and I, spring or springs J, lever arm E and rope or chain F, with each other, with the stationary box or frame A, movable frame or platform B, and gate H, substantially as shown and described and for the purposes set forth.

Second, the combination of the coiled wire spring L, or equivalent, with the gate H, substantially as and for the purpose herein set forth.

64,395.—THOMAS G. HALL, York, Pa., assignor to himself, LEWIS STRAYER, and PETER S. BOOSE, same place.—*Water Wheel.*—April 30, 1867.—Each bucket has a vertical projection to prevent the water spouting before the force is spent. The bent plates forming a converging inlet combine with a wheel having a downward and inward discharge, and with gates having horizontal projections on their lower ends to economize the water and allow its escape when the force is exhausted.

Claim.—First, the vertical projection *g* on the buckets K, substantially as described.

Second, the combination of the bent plates F, forming converging inlets with the wheel having the parts E G O constructed as described, and with gates I, having projections *i*, all arranged substantially as herein represented and described.

64,396.—ELISHA O. POTTER, Pawtucket, R. I., assignor to C. A. WARLAND and J. M. RYDER, same place.—*Machine for Cutting Files.*—April 30, 1867.—Improvement on his patent, November 8, 1864, (No. 44,998.) Explained by the claims and illustration.

Claim.—First, combining the chisel holder or device which holds the chisel with the chisel slide or other device by which the chisel is raised and lowered to and from the file blank by means of a circular bearing or socket, the center or axis of which is at or near the center of the edge of the chisel, and the plane of its oscillation is transverse to the file, substantially as described.

Second, the manner in which are combined or arranged the former or shaper which controls the inclination of the chisel to the bed, with reference to the bed and to a cutter frame made to oscillate in a vertical plane parallel to the length of the file to vary said inclination, by attaching the former or shaper to the bed and below the cutter frame, and causing the cutter frame to rest directly upon it for support, substantially as described.

64,397.—WILLIAM G. ADAMS, Franklin, Mass.—*Compound Structure of Rubber and Fiber for Belts, &c.*—May 7, 1867.—Strips of tape are cemented together by rubber, until a fabric is obtained of proper width to form the belt. A sheet of rubber of the same width is attached to one side of the fabric, which is then vulcanized.

Claim.—A compound structure of vulcanized rubber and fiber, in which the disposition of fiber is substantially that specified.

64,398.—C. F. ALLEN and LUTHER W. CAMPBELL, Aurora, Ill., assignors to themselves, A. T. HALL and A. J. AMBLER.—*Apparatus for Drying and Seasoning Lumber by Super-heated Steam.*—May 7, 1867.—A continuous supply of water is introduced by gravity into the generator without contact with the heated walls of the latter. The dry steam is introduced within the kiln, and after absorbing the moisture of the lumber, is conducted to the escape.

Claim.—First, a superheating steam generator, which is constructed and supplied with water and arranged within a drying kiln, substantially as described and for the purposes explained.

Second, in a drying kiln, the arrangement of a divisional pan F within the generator E, for the purpose of protecting the latter from contact with water, substantially as described.

Third, the floors A¹ A², with space between them, arranged at the top of the kiln, in combination with the ventducts b, leading into the kiln from beneath the drawing apartment, substantially as described.

Fourth, in combination with the escape valve *y* of the super-heating generator, the balance valve *a*, communicating with the open air, substantially as described.

Fifth, the elevated water tank G, pipe *c*, pan F, in combination with a superheating generator, which is adapted for drying purposes, substantially as described.

Sixth, a provision for conducting off the moisture from a point which is below the desiccating chamber or kiln in which superheated steam is employed for drying purposes, substantially as described.

64,399.—GEORGE H. BANCROFT, Philadelphia, Pa.—*Awning*.—May 7, 1867.—The ratchet wheels are fixed to the ends of the awning roller and are fastened by detent pawls, which may be raised by lifting cords. The end of the awning is bound round a metallic rod attachable by hooks to the posts.

Claim.—The ratchet wheel D, detents *a a'*, cords *b b'*, metallic rods *e*, and the metallic hooks *fff*, &c., when combined and arranged substantially as and for the purpose herein specified and described.

64,400.—A. ELY BEACH, Stratford, Conn.—*Pneumatic Tube*.—May 7, 1867.—The valves move perpendicularly within guides in pneumatic tubes. They are connected by levers attached to the roof of the tube, and operated by the contact of passing cars.

Claim.—The employment, in combination with pneumatic walls or tubes, of automatic valves, operating substantially as herein shown and described.

64,401.—A. ELY BEACH, Stratford, Conn.—*Pneumatic Car Truck*.—May 7, 1867.—The truck travels in a pneumatic trunk, being propelled by the pressure of compressed air against the vertical valve board, which fits the bore of the trunk.

Claim.—The employment of pneumatic trucks, made substantially as herein shown and described.

64,402.—A. ELY BEACH, Stratford, Conn.—*Pneumatic Railway*.—May 7, 1867.—A blower is arranged at one end of the pneumatic tube to exhaust or condense the air therein. When the diameter of the blower wheel exceeds that of the tube it is arranged within a casing connecting by ducts with the tube.

Claim.—The employment of the within-described device in combination with pneumatic tubes, substantially as set forth.

64,403.—D. S. BLUE, Fremont, Ohio.—*Horse Hay Fork*.—May 7, 1867.—The lever and slide, being moved down, close the arms to enter the hay, and on being reversed they open to retain it. The catch connected with the wrist prevents the discharge motion till released by the tripping cord.

Claim.—The shaft A, slide B, slots *b d*, and arms E F, in combination with the lever C, wrist *f*, and catch D, arranged and operating as and for the purpose substantially as set forth.

64,404.—EDWARD BOSTOCK, Albany, N. Y.—*Sewing Machine Tuck Creaser*.—May 7, 1867.—The plate is set so that the edge of the rail shall be as far from the needle as twice the distance between the stitching of the tucks, the gauge being set the width of a tuck from the needle. The first tuck is folded and placed under the arm with its folded edge against the gauge. As the cloth advances the grooved wheel presses it over the edge of the bevel rail, making a crease in it parallel with the stitching.

Claim.—First, the tuck creaser or folder for use with or without a sewing machine, made and operated as specified.

Second, in combination, the gaugo plate N, constructed as described, the plate A, and the creasing wheel, when both plates are adjustable relatively to each other, and also relatively to the needle and feeding device of the machine, by means of a single thumb screw.

Third, in combination with the plate A, which carries the creasing devices, the gauge plate N, having a downward projection W on the same for the purpose of sliding or adjusting it along the plate A, in such a manner as to secure a parallelism of the straight edge with the line of creasing and stitching.

Fourth, the socket or bridge L, fixed firmly upon the plate A, for embracing and keeping in true position the wheel-supporting bar D H, and also for the reception of a thumb screw M, for adjusting the vertical pressure of the wheel or creaser.

Fifth, constructing the arm D with a right-angled projection, which supports the wheel, as and for the purpose specified.

Sixth, the combination of the right-angled projection on the wheel-carrying arm D, with the right-angled projection on plate A, when the same are constructed and arranged to operate as described.

64,405.—JAMES BRADGON, Boston, Mass.—*Refrigerator*.—May 7, 1867.—Air chambers and deflec-

tors are formed between the food chamber and the casing. The current of cold water from the ice causes a passage of cool air through the food chamber.

Claim.—In a refrigerator so constructed as to have between its food chamber and the casing thereof an air space, the air passages *f l* and *k*, so located and arranged in conjunction with the deflectors *h* and *i*, and the falling water from the melting ice to establish a current of pure cool air and through the food chamber, substantially as described.

64,406.—WILLIAM B. BURNETT, New York, N. Y.—*Attaching Handles to Whitewash Brushes*.—May 7, 1867.—The staple on the brush is attached to the eye of the ferrule by set screws working in screw-tapped lugs.

Claim.—First, the construction of the ferrule D with an eye *b*, and with a series of grooves around said eye, in combination with a staple B and a set screw G, substantially in the manner and for the purpose set forth.

Second, the combination of two or more screw-tapped lugs *g g* with the open grooves *e f*, on both sides of the ferrule, and with the eye *b*, substantially as and for the purpose set forth.

64,407.—PIERRE EUGENE CHOLLET, New York, N. Y.—*Piano Forte*.—May 7, 1867.—The strings are tuned by the tension of the threaded hooks, and when in tune the pointer falls into one of the notches of the head. When the strings are relaxed and out of tune, the spring releases the levers, and throws back the pointer. The notched head is then turned, causing the levers to approach each other, and as the lower lever is raised, the spring relaxes until the pointer (against the foot of which the spring operates) is thrown into one of the notches, placing and retaining the instrument in tune.

Claim.—The combination with the levers E and H, the latter of which is provided with the hooks or their equivalents, the use or employment of the notched head, screw, and pointer for the purpose set forth.

64,408.—L. L. CRANE, Cleveland, Ohio, assignor to himself and LEAVETT CRANE & CO., same place.—*Forging Machine*.—May 7, 1867.—The lower die is set in the anvil block, and the upper one in the head of the trip. The die forms in one operation the spindle, butting ring and square of an axle.

Claim.—The dies J K, constructed as described, in combination with the anvil and trip hammer B D, all arranged and operating as set forth.

64,409.—S. F. DIMOCK, Spencer, Ohio.—*Car Brake*.—May 7, 1867.—The oscillation of the lever brings the roller in connection with a wheel, rotates the transverse shaft, and the two line shafts which are coupled together, and winds the chain upon the spool, bringing the brakes into action.

Claim.—First, the adjustable line E, rollers H and I, in combination with the rod G, shaft T, spool V, arranged and operating substantially as and for the purpose set forth.

Second, the adjustable link E, rollers H and I, in combination with the shafts J W and gearing P and L, arranged and operating as and for the purpose substantially set forth.

Third, the shafts J W, gearing P and L, in combination with the rollers Q, adjustable stay N, wheel C, arranged as and for the purpose substantially as specified.

64,410.—DANIEL A. DRAPER, Cambridge, Mass.—*Forming Letters on Type Blocks*.—May 7, 1867.—The letters, &c., are formed by pressure on the edge of the type block, which is squeezed into dies, formed in sectional metallic plates; these are clamped while pressure is applied, and unlocked to free the block.

Claim.—The combination of the within described devices for producing letters, figures, &c., upon the edges of the type blocks for hand stamps and other purposes, substantially as set forth.

64,411.—WILLIAM E. DUNN, Delaware, Ohio.—*Manufacture of Artificial Teeth*.—May 7, 1867; antedated February 2, 1867.—Improvement on the patent of Loomis, May 2, 1854. Biscuiting teeth are inserted into the yet plastic plate in the matrix; the denture is then removed, biscuiting, enameling, and finished in the furnace.

Claim.—A denture constructed by the application of biscuited and unglazed teeth to the plastic body or base while in the mold, substantially as described.

64,412.—FRANCIS ELDER, Chester, S. C.—*Washing Machine.*—May 7, 1867.—The tub has overhanging ledges inside to prevent splashing, and to hold the lid. The clothes are pressed by the rubber against a corrugated washboard at one end.

Claim.—The combined arrangement of the ledges *h i i*, cover *H*, rubber *H*, movable journal caps *l l*, and dasher board *g*, both above and below the rear or upper edge of the rubber *B*, as specified.

64,413.—T. J. FARR, Medina, Ohio.—*Wagon Brake.*—May 7, 1867.—The brake is applied by the mutual approach of the fore and rear axles, owing to the holding back of the horse, and is released by the forward draft of the horse.

Claim.—The arrangement of the slotted coupling pole *D*, bar *E*, brake arrangement *e e G G*, lever *J*, and staff *I*, substantially as described.

64,414.—M. FOREMAN and J. R. MATHEWSON, Philadelphia, Pa.—*Steam Blower.*—May 7, 1867.—The axial jet of steam is directed forward through the apparatus, and draws in annular jets of air from the pipes which it successively traverses.

Claim.—A steam pipe *E*, in combination with two or more pipes *A A'*, of different diameters, the whole being arranged and operating substantially as described.

64,415.—WM. T. GRAY, Galesburg, Ill.—*Stone-pipe Damper.*—May 7, 1867.—A revolving and reversible register is arranged on the inside of the pipe, being attached by a diametric rod. The metallic ring fills the space between the fan and the pipe; the wheel acts as an accelerator or damper according to its position above or below the metallic plate.

Claim.—The combination and arrangement of the fan wheel, with the circular plate and ring, the parts being arranged and operating in the manner and for the purpose specified.

64,416.—JAMES HART, Melbourne, Victoria.—*Apparatus for Crushing and Amalgamating Ores.*—May 7, 1867.—The ore enters the revolving cylinder from the hopper. The heavy inner cylinder rolls in and crushes the ore against the bottom of the outer one which contains mercury. The discharge cylinder is attached to the outer cylinder so as to catch any particles of metal that may pass over its edge. A current of water may flow through the apparatus.

Claim.—The combined arrangement of the cylinders *L M P*, constructed and working substantially as herein described.

64,417.—G. W. HATCH, Garrettsville, Ohio.—*Fence Post Pedestal.*—May 7, 1867.—The base of the post is attached to the hollow pedestal, whose side lugs only rest upon the foundation block and are pinned thereto.

Claim.—The construction of a metallic pedestal *A*, provided with ventilating openings *G* in combination with the post *E*, for the purpose and in the manner, substantially as described.

64,418.—F. G. HOEPFNER, New York, N. Y., assignor to himself and CHARLES BURCHARDT, same place.—*Velocipede.*—May 7, 1867.—The horse is so connected to pawls operating the rear wheels as to rotate them by its oscillation. The carriage is guided by a line passing from the fifth wheel to the bridle rein.

Claim.—The compound lever *G g h*, in combination with the body *A* of the toy and with the ratchet wheel and pawls, or their equivalents, mounted on the axle *C*, substantially as and for the purpose described.

64,419.—K. W. HOLMES, McGrawville, N. Y., and ANDREW ALDRIGHT, Dryden, N. Y.—*Coating Wood with Rubber and Gutta-percha.*—May 7, 1867.—The article is covered with rubber, placed in a mold of suitable shape and vulcanized.

Claim.—The coating and lining of wood with rubber, gutta-percha, or prepared gum, substantially as set forth.

64,420.—WILLIAM and JAMES HOLROYD, Watford, N. Y.—*Machine for Cutting Screw Taps.*—May 7, 1867.—One end of the tool-rest plate rests in bearings on a slide and lies upon a longitudinal pattern which is revolved by a spindle and belt so as to give the requisite saliency to the cutting point of the thread and recession to its heel.

Claim.—First, the vertically adjustable tool rest *D*, vibrating plate *D'* and sliding support *E*, in combination with rotary centering points *b b'*, substantially as and for the purposes described.

Second, the application of the rotary pattern *F* to an adjustable bar *H*, which is applied to a treadle *K*, substantially as and for the purposes described.

64,421.—JACOB D. HOLTZERMANN, Piqua, Ohio.—*Bitters.*—May 7, 1867.—Composed of pure spirits, sugar, orange peel, orange apple, orris root, galanga root, gentian root, calamus root, wormwood, ginger, cardamom seed, cassia, mace, nutmeg, cloves, and coriander seed.

Claim.—The compounding or combination of the above named ingredients in proportions above as set forth.

64,422.—S. T. HURLBERT, Painesville, Ohio.—*Deflecting the Bottoms of Vessels Made of Sheet Metal.*—May 7, 1867.—The inverted pan is laid upon a disk which has a flat central depression and a marginal flange; against the edge of the latter the bottom of the pan is deflected by the rotary head.

Claim.—The use of the independent rotary head, Fig. 1, constructed and operating in combination with the former, Fig. 2, in the manner substantially as specified and for the purpose set forth.

64,423.—MORRIS ISBELL, New Haven, Conn.—*Hollow Auger.*—May 7, 1867.—The flexible forks of the bit shank have a two-part head with cutters in each; the parts are adjustable toward and from each other to suit varying sizes of tenons.

Claim.—The divided head *B* in combination with the springs *C C*, the land *D* and the adjusting screw *E*, all constructed and arranged to operate substantially in the manner described.

64,424.—CHARLES H. JAMES, Cincinnati, Ohio, assignor to himself and FRANK MILLWARD, same place.—*Tube for Steam Generators.*—May 7, 1867.—Water descends in the inner tube and ascends in the more highly heated, annular outer tube, which connects with the former at the lower end, and discharges at a point above the mouth of the said inner tube.

Claim.—The stationary or rigid confined tube *K*, provided with one or more enclosed ducts or passages *L*, communicating the outer or fire tube *I*, with the water space on the crown sheet of the boiler, the outer tube *I* extending and discharging its contents above the water line or above the passage *L*, communicating with the inside tube *K*.

64,425.—JACOB JAMESON, Philadelphia, Pa.—*Manufacture of Iron.*—May 7, 1867.—To produce wrought iron direct from the ore. The ore is deoxygenized by passing it successively over a series of tables, over which the blast from the finishing furnace passes; it is then melted and finally refined in a finishing furnace, where it is subjected to a hot blast.

Claim.—First, the production of wrought iron direct from the ore by the process substantially as described.

Second, in combination with the oven *A*, constructed as described, the double furnace *I*, as set forth.

Third, the combination of the oven *A*, furnace *I*, and gas chamber *P*, for the treatment of ores when arranged for joint operation, substantially as described.

64,426.—WM. JOHNSON, 2d, Haverhill, Mass.—*Keyhole Guard for Door Locks.*—May 7, 1867.—The keyhole is covered on the outside, when the bolt is locked, by a lever plate operated by a pin from the main bolt projecting through a slot in one side of the case. Guards are provided to prevent its falling at improper times.

Claim.—First, the combination as well as the arrangement of the keyhole guard *F*, and its operation mechanism, viz: the spring *G*, the stud *I*, and the cam *K*, with the bolt and the lock case, provided with

a keyhole as set forth, such guard being for the purpose as specified.

Second, the combination as well as the arrangement of the stud L and the projection d, with the lever guard F, applied to the bolt B, and to operate therewith and with respect to the keyhole of the lock, substantially in manner as hereinbefore described.

Third, the combination as well as the arrangement of the stud L and the catch e, with the lever guard E, applied to the bolt B, and to operate therewith and with respect to the keyhole of the block, substantially in the manner as hereinbefore explained.

Fourth, the combination as well as the arrangement of the spring latch M, its catch slot and the projection N, or their mechanical equivalent, with the lock case and with the lever guard F, applied to the said case, and the main bolt, substantially in manner and so as to operate with respect to the keyhole, essentially as and for the purpose hereinbefore set forth.

64,427.—T. J. JONES, Summit, N. J., and T. L. WEBSTER, Brooklyn, N. Y.—*Faucet*.—May 7, 1867.—Explained by the claims and illustration.

Claim.—First, holding the plug of a faucet or stop cock to its seat by means of a spring, which is inserted into or through a recess made transversely through said plug, substantially as described.

Second, the construction of the V-shaped spring C with a centering notch in it, for the purpose specified.

64,428.—MARVIN H. KELSEY, Red Bank, N. J.—*Joint for Chimneys*.—May 7, 1867.—This is a collar for chimneys where they pass through the roof; its upper edges are inserted in the joints of the bricks, and its troughs collect and discharge the water.

Claim.—The metallic collar A for chimneys having the gutters a upon each side, substantially as described for the purpose specified.

64,429.—ABRAHAM B. KING, Camden, Ohio.—*Cultivator*.—May 7, 1867.—The two outer cultivators are coupled to the two inner ones by horizontal pieces, and have laterally-projecting independently-attached blades.

Claim.—First, the arrangement of the two outer cultivators F A S J F''' A''' S''' J', and the two inner and smaller ones F' A' S' K F'' A'' S'' K', so coupled together by the pieces G M D and their described accessories as to be held rigid, or to swing from side to side, or to be separated into two distinct double-share cultivators, in the manner described.

Second, the arrangement on the inner or landside, and in rear of a cultivator share of one or more independently-attached laterally-projecting blades or cutters T, substantially as and for the purpose stated.

64,430.—HENRY G. LEONARD, Taunton, Mass.—*Grate for Stoves*.—May 7, 1867.—The upper and lower sections of the grate fit together; the upper oscillates horizontally upon the lower when actuated by the lever which is pivoted in the lower section.

Claim.—In combination with a tipping and horizontally vibrating grate, the lever i into a slot in which a pin or projection from the grate works when the lever is applied to the cross-shaft or axis c, and operate the grate, substantially as set forth.

64,431.—A. M. LESLIE, St. Louis, Mo.—*Apparatus for the Preparation and Administration of Nitrous Oxide Gas*.—May 7, 1867; Antedated April 23, 1867.—The gas passes from the retort to the wash bottles and the gas holder. The wash vessels may nest into each other for portability. The connecting tubes are rubber, and fastened in the covers by thimbles, one soldered in the lid and the other inserted inside the tube where it passes through the cover. The inhaler has two valves, one opening outward and the other inward.

Claim.—First, the combination and arrangement of the tubes b, in the cap of the jar, and the tubes D and d, substantially as herein described and set forth.

Second, the employment of the india-rubber tubes D for connecting the different jars together and these to the generator and receiver, and for conducting the gas down through the water.

Third, the portable apparatus A B, when constructed and employed, substantially as herein described and set forth.

Fourth, the inhaler E, when constructed with the valves e and e'.

64,432.—LONDON LIMERICK, Louisville, Ky.—*Baby Tender*.—May 7, 1867.—The convertible chair or couch rests on a yielding frame supported by coiled springs on a base which travels on rollers.

Claim.—First, the arrangement of chair E H I, adjustable forward or backward, along a spring C, for the object explained.

Second, the combination of base A, spring C, sliding chair F G H I, and auxiliary spring E.

Third, the chair F G H I, with the brackets K K' L, knobs N O, adapted for a sitting or any recumbent position and supported upon a spring or yielding rest, substantially as set forth.

64,433.—ROBERT O. LOWREY, Saratoga Springs, N. Y.—*Foundation for Roofs*.—May 7, 1867.—Hydraulic cement and sand are made into a mortar and spread while in a plastic condition on the roof boards as a foundation for roofing material.

Claim.—A plastic foundation for roofing cement, prepared and applied substantially as herein described.

64,434.—DAVID DICK MATTESON, Harmonsburgh, Pa.—*Spring for Vehicles*.—May 7, 1867.—The ends of the spring are bent, and support the bed on each side near the corner; the middle is bent rectangularly in a horizontal plane, and one portion rests on the axle.

Claim.—A spring for carriages or buggies constructed of one piece of steel bent or formed in the manner described, constructed in the aforesaid combination and for the purposes set forth.

64,435.—THOMAS B. MCCONAGHEY, Newark, Del.—*Governor*.—May 7, 1867.—When the balls fly outward under accelerated motion the blocks are brought against the internal flange of the loose wheel and cause it to revolve, winding the cord and operating the steam valve. Springs return the parts to normal position on the decline of the speed.

Claim.—First, the governor arms, a a, in combination with the main piece B, and loose collar d, as and for the purpose set forth.

Second, the spring c c, in combination with governor arms a a, substantially as and for the purpose specified.

64,436.—JOHN S. MCINTIRE, Chicago, Ill.—*Oil Can*.—May 7, 1867.—The spout enters the funnel-shaped rim, above the level of the neck, so that a stopper in the latter closes both. An air inlet pipe, to assist in the discharge may be added.

Claim.—First, the narrow neck B, arranged relatively to the can A, and side spout D, substantially as and for the purposes specified.

Second, the arrangement and combination of the narrow neck B, the funnel C, side spout D, and vent tube F, with the can A, substantially as set forth.

64,437.—BARNEY MEE, Troy, N. Y.—*Hose Coupling*.—May 7, 1867.—The ordinary washer and loose ring of one section are dispensed with, as well as the necessity for forcing the sections toward each other in the line of their axes.

Claim.—First, a packing ring applied in a recess in the male part of a coupling in combination with a female member of the same coupling, the combination being substantially as specified.

Second, in combination with a packing ring, applied and acting as specified, and the male and female parts of a coupling, a bayonet fastening, or the mechanical equivalent, or substitute therefor, for holding the parts in place until pressure is applied to the packing ring, the combination being substantially such as set forth.

Third, an annular recess, in combination with the male part of the coupling, and with holes leading into it from the hollow of the coupling, forming a seat and an apparatus for applying pressure to a packing ring, the combination being as described.

Fourth, an annular recess, formed in the periphery of the male part of a coupling, provided with holes leading into it from the hollow of the coupling, in combination with the female part of a coupling, whereby a packing ring may be applied so as to pack a coupling joint, the combination being as described.

64,428.—N. M. MENDENHALL and J. JUDD, Terre Haute, Ind.—*Hand Spinning Machine.*—May 7, 1867.—By shifting the lever by its handle the reversing pinion is thrown into gear with one or the other of the pinions and so reverses the traverse of the carriage as desired. When the movement of the carriage engages a pinion with the rack-bar, thus feeding out the rolls from the apron, the trip bar is pressed by the front end of the carriage, freeing its notched edge from its detaining loop and relieving the tension of the cord so that the spring may rotate the roller and throw up the faller bar to allow the winding from the bottom to the top of the rotating spindles.

Claim.—First, the lever *p*, notched bar *q*, reversing pinion *O*, gear wheels *l* and *l'*, and pinions *m* and *n*, pulley *s*, and cord *s'*, in combination with the carriage *c*, as and for the purpose specified and set forth.

Second, the vibrating bar *y'*, spring *7*, cord *y''*, trip bar *y'''*, link *9*, lever *10*, cam bar *5*, cam *6*, arranged and operated substantially as above described and for the purpose specified.

64,439.—JOHN H. MOORE, Binghamton, N. Y.—*Moving Buildings.*—May 7, 1867.—The rollers are arranged in the parallel sections of the frame, which are attached by hooks and scraper bars. The rollers may move in different directions to enable the truck to turn at a short angle.

Claim.—The construction of the frame *A*, and the roller *B*, in combination with the parallel bars *or* scrapers *G*, the lever and lock *H*, the hooks *P*, the bolster *C*, as represented and described.

64,440.—WILLIAM A. MORSE, Philadelphia, Pa.—*Stair Rod.*—May 7, 1867.—Explained by the claim.

Claim.—First, a stair rod made of paper, paper pulp, felt, cloth, leather, or other equivalent fibrous material, lacquered, gilded, or otherwise ornamented to resemble highly finished brass, substantially as described and for the purpose specified.

Second, the use of paper, paper pulp, felt cloth, or leather, either separate or in combination, in the manufacture of stair rods, substantially as specified and for the purpose set forth.

Third, the use of either of the above-named materials in combination with wood or metal, substantially as specified and for the purpose set forth.

64,441.—JOHN B. MULVEY, Visalia, Ky.—*Window.*—May 7, 1867.—By withdrawing a bolt the pulley style may be pressed back to permit the withdrawal of the sashes without disturbing the stops or parting strips. The bolt is locked in place by a removable key.

Claim.—First, the combination of the solid window frame *G G'*, spring pulley style *E*, and locking device *H I i*, substantially as shown and set forth.

Second, the locking device, composed of the square bolt *H*, removable key *I i*, and cleat *J*, as set forth.

Third, attaching the cords of the weight to the sash by means of the grooves *k k*, the recess *l' m m'*, the pins *n n'*, and knots *o o'*, substantially as set forth.

64,442.—D. B. NELSON, Elmira, N. Y.—*Shovel.*—May 7, 1867.—Angular points are formed on the edge of an ordinary shovel.

Claim.—Constructing shovel blades with teeth, substantially as and for the purpose set forth.

64,443.—SAMUEL PAGE, Chelsea, Mass.—*Composition for Painting and Varnishing.*—May 7, 1867.—Improvement on his patent of October 11, 1859. The light distillate of coal tar distilled at a low temperature is re-distilled and the product mixed with the residuum left from the further distillation of the tar at a higher temperature.

Claim.—Treating the light distillate by additional substances as and for the purpose described.

64,444.—L. J. PARSONS, New Haven, Conn., assignor to himself and HENRY REYNOLDS, same place.—*Attaching Bits in Braces.*—May 7, 1867.—The perforated plate on the face of the socket is held by the sleeve against the shoulder of the bit.

Claim.—The combination of the plate *a*, with the socket *B*, and sleeve *C*, constructed and arranged so as to operate substantially as herein set forth.

64,445.—MARVIN PIERCE, Buffalo, Wis.—*Washing Machine.*—May 7, 1867.—The board has uprights

perpendicular to its sides, which have slots at their upper ends, to receive the gudgeons of a frame carrying a perforated and corrugated roller which is oscillated by hand.

Claim.—The combination of the rotary cylindrical rubber *E*, sweep *C*, slotted uprights *BB*, and wash-board *A*, the latter having the opening *a*, and soap-shelf *p*, and all being constructed and arranged as herein described and represented.

64,446.—ALBERT J. REDWAY, Cincinnati, Ohio.—*Fire-Place.*—May 7, 1867.—The crown of the fire-place is closed at front and back, but has side openings for the calorific current which passes over said crown to the chimney.

Claim.—First, surmounting the fire chamber of a grate or stove with the arched crown *C*, which extends from the front to the back of the fire-chamber, and is provided with the side flues *D D'*, all arranged and operating in the manner herein described and set forth.

Second, in combination with the crown *C*, and side flues *D D'*, the flue strips *G G'*, and abutments *H H'*, for the purpose specified.

64,447.—T. C. RICE, Worcester, Mass., assignor to THOMAS H. DODGE and T. W. WELLINGTON, same place.—*Apparatus for Rolling Wrench Bars.*—May 7, 1867.—The rolls have the necessary projections and recesses to form the blank into the required shape, by successive operations.

Claim.—First, the herein described combination of machinery for rolling wrench bars and other similar articles, organized substantially as herein shown and described for operation as set forth.

Second, the combination with the tongued segment roll *H*, and grooved segment roll *I*, of the stationary stop *f*, and table *L*, all constructed and arranged substantially as and for the purposes set forth.

Third, the combination of the notched segment roll *J*, and flanged segment roll *K*, constructed arm arranged for operation as described.

Fourth, the combination with the notched segment roll *J*, and flanged segment roll *K*, of the table *3*, and stationary stop *h*, substantially as and for the purposes set forth.

Fifth, the combination with the notched segment roll *M* and flanged segment roll *N*, of table *4*, and adjustable stop *s*, substantially as and for the purpose set forth.

Sixth, the combination with the tongued segment roll *Q* and the grooved segment roll *R*, having the flanges *x x* cut or inclined as shown at *c'*, of the table *6* and adjustable stop, as and for the purposes stated.

64,448.—DANIEL T. ROBINSON, Boston, Mass.—*Horse Collar.*—May 7, 1867.—The roll of the collar is formed with strips of raw hide, riveted together at the upper end.

Claim.—In the manufacture of horse collars, forming the roll of strips or layers of raw hide, arranged upon the collar, and secured together in the manner and for the purposes substantially as herein set forth.

64,449.—C. A. ROSE, Columbus, Ga.—*Manufacture of Paper Pulp.*—May 7, 1867.—The stalks of the cotton plant are combined with pine leaves; the long fibres give tenacity to the paper.

Claim.—The combination of pine leaves and cotton stalks, either with or without the addition of oak leaves and pine cones, as a material for making paper pulp.

64,450.—WARREN ROWELL, New York, N. Y.—*Transmitting Motion.*—May 7, 1867.—The ordinary crank is connected by rods to two additional cranks which rotate with it.

Claim.—The combination of the cranks *D D' D''*, and arms of rods *E E' E''*, or other suitable connection, so arranged relatively with each other that when rotary motion is imparted to the crank *D*, it will be transmissible to the cranks *D' D''*, and the shafts connected thereto, as herein described.

64,451.—WARREN ROWELL, New York, N. Y.—*Transmitting Motion.*—May 7, 1867.—The cranks have a connecting rod and their ends have rectangular arms projecting in the plane of their rotation and having wrist pins also connected by a rod.

Claim.—The hereinbefore described means for transmitting a continuous coincident rotary motion.

64,452.—PHILIP SCHWEIKHART, Buffalo, N. Y., assignor to DANIEL SCHWEIKHART, Eden, N. Y.—*Beer Cooler.*—May 7, 1867.—The air supplied by the fans is cooled on its passage through the ice chamber from which it is conducted through the liquids on their descent through and over the perforated troughs.

Claim.—First, a beer cooler having an ice box B, a chamber C, containing the liquid, and an air flue D and fan blower E, or equivalent, constructed, arranged, and operating substantially as herein described.

Second, cooling beer or other liquids by dividing the same into a large number of fine streams and forcing an ascending current of cold air through the descending liquid, in the manner and for the purpose substantially as herein described.

Third, the perforated plate or troughs F, having flanges $f^1 f^2$, arranged in the manner substantially as herein described.

Fourth, the sieves G G^1 , in combination with the chamber C, for the purpose and substantially as described.

64,453.—THADDEUS SELLECK, Greenwich, Conn.—*Railway Chair.*—May 7, 1867.—The ends of the rails rest upon a plate spanning the spaces between three or more ties; upturned edges of the plates embracing the rail base. The plates are clamped by bent plates at the rail junction and the ends of the plate.

Claim.—In combination with the rails A A, the flanged plate C, extending the distance of three or more intervals of the ties, the clamp, D, extending across the middle interval and embracing the point of junction of the rails and the end clamps E E, all arranged substantially as herein described and represented.

64,454.—WILLIAM P. SLENSBY, Chicago, Ill.—*Tool for Cutting off Boiler Tubes.*—May 7, 1867.—The support of the cutter is placed within a transverse groove in the stock and is adjusted laterally by a screw.

Claim.—First, the combination and arrangement of the revolving head block B, the adjustable cutter holder D, and the slotted collar F, as and for the purposes set forth and shown.

Second, in combination with the above the shaft A and ratchet handle C, operating as specified and for the purposes described.

64,455.—THOMAS H. SPENCER, Providence, R. I.—*Tooth Brush.*—May 7, 1867; antedated April 23, 1867.—The dentifrice receiver slides in the hollow handle of the brush.

Claim.—The tooth brush having a detachable handle and a dentifrice container therein, substantially as described.

64,456.—WILLIAM MONT STORM, New York, N. Y.—*Proof Meter and Register for Alcoholic Spirits and other Liquids.*—May 7, 1867.—A drum rotating with the amount of liquor passing through the meter, has a paper scale stretched upon it, which is marked by a pencil attached to a hydrometer to indicate the strength of the liquors.

Claim.—First, the float E acting as a hydrometer, and carrying a pencil or pencils, or any equivalent, in combination with the drum G, covered with paper or some equivalent, rotating in contact with such pencil or pencils, or their equivalents, so that they shall describe a line denoting the varying specific gravity of the liquor flowing through the instrument.

Second, the diagram Figs. 3 and 8, in combination with the instrument, having the hydrometer scale in horizontal lines upon it, and vertical lines to denote gallons, &c., as explained.

Third, having the pencils independently of their rise and fall with the hydrometer or float E, acted upon by changes of temperature, substantially in the manner and for the purpose described.

Fourth, the use of two pencils, acting in the manner and for the purpose explained.

Fifth, the use of the overflowing well A, for the purpose described.

Sixth, the application of the spring α , or any equivalent device, for the purpose set forth.

Finally, the instrument as a whole, its parts being constructed and operating together, substantially in the manner and for the purpose explained.

64,457.—WILLIAM MONT STORM, New York, N. Y.—*Liquid Meter.*—May 7, 1867.—Designed to be attached to the worm of a still, and operates on the principle of a steam pump, having a glass-lined, perforated cylinder, a valve chest and induction and education passages. The capacity is regulated by a right and left screw, which adjusts the pistons toward and from each other.

Claim.—First, the arrangement of the valve i , rod j and lever l , operating in conjunction with the sleeve z and piston rod f , as and for the purpose described.

Second, regulating a liquid meter, constructed substantially as described by means of the adjustable pistons $f f$, as and for the purpose explained.

Third, the glass cylinder a , embracing a piston or pistons, moving on a central rod, and supported by a perforated exterior case, as and for the purpose specified.

64,458.—WALTER L. STRONG, San Francisco, Cal., assignor to himself, G. W. STRONG, and J. F. TAYLOR.—*Amalgamator.*—May 7, 1867.—The mullers are attached to two sets of arms, and rotate in the pan in different directions by means of gear wheels and an axial shaft, which passes down through the bottom of the pan, and is put in motion by gearing.

Claim.—First, the shoes $c e$ and $g g$, in combination with the attaching joints d and h and the arms D and G, substantially as and for the purpose described.

Second, the geared wheels $L m m$ and the rim n , in combination with the shaft F and muller G g , as described.

Third, the wrench O, with the shaft P, operating upon the wheels $m m$, rim n , and shaft F, substantially as and for the purpose described.

64,459.—LUMAN D. TAYLOR, Granville Center, Pa.—*Hay Loader.*—May 7, 1867.—The endless toothed belt is driven by bands from the ground wheels. It runs over three rollers, the two lower ones are elevated an equal distance above the ground.

Claim.—The arrangement in the pivoted and adjustable frame D of the belt G and auxiliary delivery belt J, substantially as described and represented.

64,460.—JOHNSTON THOMAS, Huntingdon, Pa.—*Churn Dasher.*—May 7, 1867.—To the perforated and hinged dashers are attached two atmospheric pipes, which on the raising of the dasher, conduct air into cream. On the descent of the dashers the leaves collapse, easing the downward motion.

Claim.—The adjustable dasher and butter gatherer H and G, the lower perforated circular dasher B, the adjusting rod L, the atmospheric tubes D, and their ball valves E at top, all in combination, when constructed, arranged, and operated as herein described and for the purposes set forth.

64,461.—M. G. TOUSLEY and F. E. MARCELLUS, Fulton, Ill.—*Nose Jewel for Swine.*—May 7, 1867.—The pointed bolt perforates the snout, and its point enters the countersink.

Claim.—The arrangement and construction of the device, when constructed, arranged, and operating as and for the purpose above set forth.

64,462.—MYNARD I. TURCK, Shodack, N. Y.—*Horse Hay Fork.*—May 7, 1867.—By drawing the trip cord that runs over the pulley attached to the jointed cross-bar, the tines are expanded for insertion in the hay; they are contracted when the cord is loosened, the draft attached and the toggle bar straightened. They again expand to deliver the hay by drawing the trip cord.

Claim.—The arrangement and combination of the jointed cross-bar A A, tines F F, cross-bar B, trip cord t and pulley P, substantially as and for the purposes herein set forth.

64,463.—MARQUIS D. WALLACE, White Creek, N. Y.—*Churn.*—May 7, 1867.—The churn tub sets within the frame, and the inner rod of the dasher is adjusted telescopically in the screw rod according to the amount of cream.

Claim.—The combination of the frame B b and adjustable telescope shaft I, constructed and operating as described.

64,464.—GEORGE WATT, Richmond, Va.—*Plow Handle.*—May 7, 1867.—The curve of the handle is formed with a cast socket to avoid bending the timber.

Claim.—The curved metallic socket A, constructed as described, and employed for the purpose specified.

64,465.—MARSHALL D. WELLMAN, Pittsburg, Pa.—*Fire-place.*—May 7, 1867.—The rear part of the fire grate has communication with a rear flue by a passage furnished with a damper by which the combustion in the rear part is regulated. The top plate of the grate is removable and the ashes from its upper side fall into a chamber behind, having an opening into the ash pit through which the soot is removed.

Claim.—First, the combination of the shallow recess g in the back wall, or back wall and side walls of a fire-place, with the opening i and flue k, substantially as and for the purposes hereinbefore set forth. Second, making the rear part of a fire basket with grate bars e e, parallel to each other, and closer together than the bars d that compose the front part of such fire basket, substantially as and for the purpose hereinbefore set forth.

Third, the combination of the dust holes m m, furnished with slides n n, the air passage i, and flues k, for the purpose hereinbefore described.

Fourth, the use of the tapering grate bars for the purpose of diminishing gradually the amount of air admitted to the fire, as the space between the bars.

Fifth, perforating the tapering grate bars with air holes, for the purposes hereinbefore described.

64,466.—WALTER WHEELER, JR., North Providence, R. I., assignor to himself, PARDON JENKS, and E. O. POTTER, same place.—*Machine for Folding Cloth.*—May 7, 1867.—The cloth descends and its edges are held for a period by the reciprocating clamps alternately. The clamp shafts rock on their axes so as to throw the clamps out of the folds as made; the lower edges of each fold hang free. The delivery roller being actuated by the same machinery that operates the clamps, the folds are made of uniform length.

Claim.—First, an apparatus for folding cloth, which employs two sets of folding clamps, or the equivalent thereof, acting in alternation, to hold the cloth suspended by the upper folds already made, while a new fold is being laid, and operating for the purpose substantially as described.

Second, the combination in a machine for folding cloth of the following: first, delivering rolls or equivalent means for supplying cloth to be folded; second, an inclined conductor F, and transverse folding bar G, and two sets of clamps working in alternation, all substantially as herein described.

64,467.—SAMUEL H. YOUNG, St. Louis, Mo.—*Disinfecting Coffins.*—May 7, 1867.—A box lined with beeswax or asphaltum is placed within the coffin and in the box is a coil of hemp saturated with acetic acid and spread with chloride of lime. An aperture is made in the coffin to allow the disinfecting gases to escape.

Claim.—First, deodorizing and disinfecting corpses by enclosing the same in a receptacle wherein chlorine, or other equivalent, or distilling gas, is continuously generated and liberated, substantially in the manner and for the purposes herein set forth.

Second, the combination of a disinfecting and deodorizing compound with the interior of a coffin, in such a manner as that there shall be a gradual and constant generation and liberation of a disinfecting and deodorizing vapor in the coffin, substantially in the manner and for the purpose herein set forth.

64,468.—H. S. ALLEN, Granger, Ohio.—*Attaching Carriage Thills.*—May 7, 1867.—The hook is inserted over the pin, between the jaws, the back shoulder is concaved to fit the hook.

Claim.—The hook or head C, provided with a slot a, in combination with the pin D, cheeks or jaws E, and back piece F, arranged as and for the purpose set forth.

64,469.—JOHN H. ALLISON, Eureka, Ill.—*Cultivator.*—May 7, 1867.—The foot lever adjusts the harrows laterally to follow the sinuosities of the row. A rod in the front end of the foot lever is engaged with a hook above it to keep the frame elevated. The driver's seat is secured to longitudinally slotted parallel bars made adjustable to balance the machine.

Claim.—First, the harrows I I, connected together, and to the front part of the frame A as shown, in combination with the foot lever F, all arranged to operate in the manner substantially as and for the purposes set forth.

Second, the adjustable driver's seat D, in combination with the harrows and foot lever, substantially as and for the purpose specified.

64,470.—E. B. ANDREWS, Osborn Hollow, N. Y.—*Organ Pipe.*—May 7, 1867.—The object is to prevent the division of the tone of the pipe from one key to another, when the pressure varies.

Claim.—An organ pipe, having its throat B upon the outside, with the tuning plug C back of the throat, substantially as and for the purpose described.

64,471.—STEPHEN BALLARD, Sr., Sullivan, Ind.—*Churn.*—May 7, 1867.—The jointed arms and knives are attached to the rotary dasher shaft and act in combination with perforated breakers hinged to the side of the churn.

Claim.—First, the combination of the knives P and hinged or jointed arms N and O, with the dasher shaft J, substantially as described and for the purpose set forth.

Second, the combination of the circular dasher L, constructed as described with the dasher shaft J, substantially as described and for the purpose set forth.

Third, the combination of the frame E and gearing G H I, with each other and with the sides and top or cover D of the churn A, substantially as described and for the purpose set forth.

64,472.—JOHN BALLY, Deposit, N. Y.—*Fruit Picker.*—May 7, 1867.—One jaw is attached to the pole and forms the frame for the hood of the sack; the other jaw is actuated by a cord and a recoil spring. The fruit falls into the conveyer.

Claim.—The jaws A and B, constructed as described and provided with knife C, shield i, and spring, when used in combination with the socket F and bag C, for the purposes specified.

64,473.—S. J. BEELER, Wales, Ill.—*Soap.*—May 7, 1867.—Composed of stone lime, 14 lbs.; concentrated lye, 1 lb.; sal soda, 2 lbs.; salts of tartar, 1 oz.; borax, 6 oz.; saltpetre, 1 oz.; alum, 6 oz.; animal grease, 5 lbs.; and a sufficient quantity of soft water.

Claim.—The use of the ingredients herein named in the proportions substantially as set forth, when treated as described, for the manufacture of a new article of chemical erasive soap.

64,474.—HENRY M. BEIDLER, Chicago, Ill.—*Lamp.*—May 7, 1867.—Metallic conductors, in connection with the heat of the flame rarefying the air in the tubular frame, cause it to ascend to feed the flame.

Claim.—A metallic conductor to conduct heat from the illuminating flame of a lamp down into a tube or hollow case below, to rarefy the air therein, and cause an ascending current of air to feed the flame, substantially as described.

64,475.—CALVIN BISSELL, Aurora, Ohio.—*Hand Rake.*—May 7, 1867.—The operator holds the handles, the rake is drawn by a clevis being either upset or withdrawn to discharge the load.

Claim.—The herein described rake in its special construction and arrangement in the manner and for the purposes specified.

64,476.—JOHN BLACKIE, New York, N. Y.—*Coffee Pot.*—May 7, 1867.—The three compartments have ducts, so arranged, that when the water which is placed in the outer compartment is raised to boiling point, the pressure of generated steam will force it up into the leach at the top of the inner vessel that holds the coffee.

Claim.—First, a coffee pot constructed with the

three compartments A' B' and E and the tubes C and D, or their equivalents, in combination, to produce the effects set forth and described.

Second, a coffee pot constructed with an inner and outer receptacle communicating with each other, so that the water shall be heated in the outer and then pass into the inner, and so that the vessel containing the solution of coffee shall be surrounded by an air or water space, and the said solution thereby prevented from being heated to the boiling point, substantially as set forth.

Third, the leaching vessel G and tubo H, provided with the cap I, in combination with the tube D and chambers B' and E, substantially as and for the purpose set forth.

Fourth, the siphon C, in combination with the compartments A and B and the tube D, substantially as and for the purpose set forth.

64,477.—BENJAMIN A. BLANDIN, Charlestown, Mass.—*Bench Plane.*—May 7, 1867.—The lower end of the rocking bed piece is convex on its under surface, which rests on a seat in the stock. The upper face of the lower bed piece has a plane face on which the plane iron is supported, the rear end of the iron straddling a screw upon which the adjusting nut works.

Claim.—Combining with a mechanism for clamping a plane iron in position, the rocking bed piece *l*, supported and rolling in a concave seat *k*, and serving to support and adjust the cutting edge of the plane iron, substantially as set forth.

64,478.—GEORGE E. BOOTH, Seymour, Conn.—*Hollow Auger.*—May 7, 1867.—The lower cutters are pivoted eccentrically and by partial rotation are adjusted to the size required.

Claim.—First, the circular cutters D, pivoted eccentrically with the axial center of the auger, and operated substantially as and for the purpose specified.

Second, the plate E, with the rack *c* and pinion *b*, arranged substantially for the purpose set forth.

Third, the thimble F, in combination with the barrel A and the cutters D, substantially as described.

64,479.—EDWARD BOURNE, Pittsburg, Pa.—*Steam Generator.*—May 7, 1867.—The flues are enclosed in separate cylinders of larger diameter with intervening annular water spaces, which connect with the water space around the fire box. The caloric current passes through the internal tubes and then around the outside of the external outer tubes.

Claim.—So arranging and combining the tubes with relation to the fire box and the water space therein, as that the smoke or products of combustion not only pass through the interval tubes, but can be made to pass around the outside of and between the external tubes or surrounding cylinders, substantially as herein shown and set forth.

64,480.—JAMES N. BREWSTER, Brooklyn, N. Y.—*Ironing Board and Closet.*—May 7, 1867.—The board is connected to the closet and supported in a horizontal position when in use; at other times hanging vertically.

Claim.—The ironing board constructed with a hinged slide *e*, arranged to operate in the guides *b*, and in relation with the bars or stops *f* and *n*, substantially as herein set forth, for the purpose specified.

64,481.—B. Q. BUDDING, Milford, Mass.—*Pegging Machine.*—May 7, 1867.—The vibrating awl is driven at the point marked by the retaining tooth and is followed by the charged peg tube.

Claim.—In combination with the vibrating awl and the peg tube, the retainer tooth *f*, so arranged in relation to the awl that the awl will be driven into the hole previously made by the tooth, substantially as and for the purpose set forth.

64,482.—JONATHAN BULLIS, Macedon, N. Y.—*Hay Loader.*—May 7, 1867.—The rope extends over pulleys and through the hollow crane post, thence round the vibrating pulley shaft and drum, which is actuated by an endless band connecting the shaft with a driving wheel on one of the supporting wheels.

Claim.—The arrangement of the detachable hollow crane post P, elevating cord C, drum D, and vibrating

pulley shaft S, with its sliding box *f* and lever or connection bar *l* and the pulley *p*, in connection with the driving wheel *w*, attached to the ground wheel G of the wagon, when said parts operate in the manner and for the purposes shown and described.

64,483.—P. S. BURDITT and O. PRESTON, Hawk-insville, N. Y.—*Signal Whistle.*—May 7, 1867.—When the cord is pulled, it forces the piston rod into the cylinder, compressing the air, which escapes through the disk and produces the sound.

Claim.—First, the valve E, cylinder C, piston rod D, and cord I, all combined and operated as and for the purpose set forth.

Second, the sliding plate G, spring H, roller J, and pulley K, all combined and operated as and for the purpose specified.

64,484.—HENRY CALLAHAN, Dayton, Ohio, assignor to himself and JOHN REESE, same place.—*Bucket Ear.*—May 7, 1867.—The ear passes through a slot cut in the tin plate, which is then bent over the ends of the wire.

Claim.—The bucket ear B, when constructed substantially as described.

64,485.—EDWIN H. CAMP, Jackson, Mich.—*Hot Air Furnace.*—May 7, 1867.—The fire space has a series of vertical tubes near its outer edge and an upper annular space with similar tubes, which form passages for heating air. From the upper end of the annular space the caloric current passes to a central tube having its upper exit regulated by a damper, which, when closed, causes it to dive and find exit horizontally from the side pipe.

Claim.—The two tiers of tubes marked *a* and *c*, in combination with the space D, substantially as described, for the purposes specified, and in combination with the furnace.

Also, the diving flue E and the bent tubes F, arranged substantially as described, in combination with a hot-air furnace.

64,486.—GEORGE W. CARPENTER, Jarvis, Ind., assignor to himself and P. C. STUART.—*Door Strip.*—May 7, 1867.—The guide raises the hinged strip over the threshold, and it is forced into a vertical position by pressure against the jamb.

Claim.—A hinged weather strip C, which in closing the door is raised by the guide E over the threshold and forced into a vertical position by pressure against the jamb, against which it rests in front of the threshold when the door is closed, substantially in the manner set forth.

64,487.—A. H. CARYL, Groton, Mass.—*Atmospheric Railroad.*—May 7, 1867.—A tube extends along an elevated track supported on columns and supplied with compressed air by an engine. The tube, at suitable intervals, has valves and discharge pipes whereby the driving mechanisms on the suspended cars are supplied with power.

Claim.—First, the tube, arranged as specified, for the holding of compressed air, in combination with tanks or reservoirs on the cars, which supplies the engines that propel the cars, substantially as described and for the purpose specified.

Second, the iron tube placed on iron columns or otherwise suspended or supported above the carriage way to support a railroad track or tracks, as set forth, when such tube is strengthened by a vertical iron partition, or when made with perpendicular walls, in the manner described, for the purpose specified.

Third, the combination of the pipe B, rings C, ways D, bars E, bars F, diagonal arms G, and rods H, and pillars A, in the manner described, for the purpose specified.

Fourth, the supply tubes O, in combination with bosses P, arms Q, and sliding tubes R, operating with the tube S, and admitting the compressed air into the receptacle N, substantially as described, as and for the purpose specified.

64,488.—LEWIS S. CHASE, New York, N. Y.—*Picture Frame.*—May 7, 1867.—The central bar of the frame is attached with screw buttons and is easily removed for insertion of card advertisements, &c.

Claim.—The frame for advertising and other pur-

poses, constructed with the bars removable or detachable by unscrewing the button, and the other bars with grooves for allowing the glass to be removed, and arranged substantially as herein recited.

64,489.—WILLIAM H. CHRISTIE, Albany, N. Y.—*Shoe Lacer.*—May 7, 1867.—The plate is doubled to form a lace hook and shank outside, its ends entering a hole in the leather and clinching within.

Claim.—The hook doubled at the stem and curve, with the ends thereof projecting below the stem for inserting through the shoe or other article and clamping thereto, when formed of one strip of metal, and constructed and arranged as herein specified.

64,490.—JOHN CHRISTLEY, Slippery Rock, Pa.—*Churn Power.*—May 7, 1867.—The treadle is connected to the walking beam by a pendulum arm imparting reciprocating motion to the dasher rod attached to one end of the walking beam.

Claim.—The combination of the walking beam D, handle H, vertical bar E, pendulum rod K, treadle I, connecting rod C, spring L M, dasher rod F, and fly wheel, substantially as described, for the purpose specified.

64,491.—C. H. CLARK, Wilmington, Del.—*Piston Packing.*—May 7, 1867.—The wedge-shaped rings set within the groove in the perimeter of the piston head; steam passes through apertures and expands the rings against the bore of the piston.

Claim.—First, the packing rings B and C, of wedge-shaped form, with the recess *i* between their faces and with the saw-parted and slotted ends in combination with a piston.

Second, the valves *a* and *b*, in combination with the packing rings and the apertures through the piston head, substantially as described.

64,492.—CALVIN COLE, Ithaca, N. Y.—*Sash Stop.*—May 7, 1867.—A friction wheel is applied between the edge of the sash and frame which forms the bearing for the cord; the ends of the latter are secured to adjustable brackets, by which means the tension can be adjusted.

Claim.—First, the combination of the friction wheel *b*, having a limited sliding movement with the friction bearing or surface *c*, and the sustaining cord *d*, substantially as herein described for the purpose specified.

Second, the combination of the slotted adjustable piece *e* with the sustaining cord, substantially as herein described for the purpose specified.

64,493.—M. CONVERSE and A. C. TORRY, Jordan, N. Y.—*Composition in Roofing.*—May 7, 1867.—The felt sheets are covered with a composition of coal tar, cement, water lime, and sand.

Claim.—The mode of covering roofs by coatings of felt and a mortar composed of the ingredients named and compounded, combined and applied substantially as set forth.

64,494.—E. W. H. COOPER, Hartford, Conn.—*Tool Holder.*—May 7, 1867.—At the end of the rectangular shank is a conical socket which receives the segmental chuck in which the tool is held.

Claim.—The chuck B, either sectional or split in combination with the conical socket *a*, in the tool holder A, constructed and operating substantially as and for the purpose set forth.

64,495.—E. COPE and J. R. MAXWELL, Cincinnati, Ohio.—*Screw Suedging Machine.*—May 7, 1867.—Right and left spirally grooved rollers operate upon the end of the sheet metal tubes presented thereto and swage a thread thereon.

Claim.—First, constructing said rolls with right and left-hand screws respectively and arranging them so that the threads upon one shall bend the metal into the grooves of the other, all substantially as above set forth.

Second, also in combination with the subject-matter of the first claim, leaving a portion of the surface of the rolls plain or blank in the manner and for the purpose described.

64,496.—MARTIN H. CRANE, Cincinnati, Ohio, assignor to CRANE, BREED & CO., same place.—*Me-*

talic Burial Case.—May 7, 1867.—The case is stiffened by rails, sills, and styles of wood covered with sheet metal and soldered to the body of the case.

Claim.—First, a metallic burial casket stiffened by sheet metal drawn over wood and secured to the body of the case by soldering, in the manner and for the purpose set forth.

Second, the combined arrangement of the body proper of the wood and metal rim or rail C, for the reception of the screws employed to fasten the lid in the described combination with the composite wood and metal styles, the said rail sill and styles being formed separately from said body and the sills B, and afterward firmly soldered thereto and to each other, as set forth.

64,497.—GEORGE H. CROSS, Montpelier, Vt.—*Steam Confection Pan.*—May 7, 1867.—A funnel-shaped pan with a false bottom is arranged in a suitable frame. The lower portion of the pan forms a steam chamber, and the funnel is revolved by gearing.

Claim.—The hollow shaft D, attached to the pan, the steam pipe E, passing through the shaft, the reversed T G, and the pipes H and J, in combination with a steam confectioners' pan, the whole constructed, arranged and operating substantially as herein shown and described.

64,498.—J. W. CROSSLEY, Bridgeport, Conn.—*Machine for Cutting Tobacco.*—May 7, 1867.—The revolution of the crank feeds forward the tobacco and also makes the draw cut of the knife. The latter is attached at one end to the bed by a pivoted arm, and at the stud at the other end is guided in a curved slot so as to give it a simultaneous downward and longitudinal motion, derived from a bell crank operated by a cam on the driving shaft.

Claim.—First, the radius arm E, fixed plate *e*, provided with the curved slot *d*, the lever G, and pin *c*, cam M, and knife bar D, all arranged in the manner substantially as and for the purpose set forth.

Second, the screw T with the plunger U, attached nut S, ratchet wheel V, pawl W, and arm R, all combined and arranged to form the feed mechanism, as set forth.

Third, the adjustable rod N and screw bolt *n* for the purpose of regulating the throw of the pawl W, as set forth.

64,499.—L. DAUBERT, Louisville, Ky.—*Apparatus for Extracting Oil from Herbs and for other Purposes.*—May 7, 1867.—The herbs are placed in the vessel which is connected by pipes with the annular water space surrounding the furnace. The water circulates through the pipes.

Claim.—The annular chamber C with the furnace or fireplace B within said chamber, in combination with the pipes D E and boiler A, arranged as and for the purpose set forth.

64,500.—G. W. DAVIS and G. A. ROLLINS, Nashua, N. H.—*Steam Engine Governor.*—May 7, 1867.—The valve stem which is adjusted vertically by the motion of the governor balls under changes of speed, operates a bell crank, rock shaft, and link, and varies the position of the lifter relatively to the cross-head of the valve stem.

Claim.—The revolving eccentrics K, lifters J, links *i*, arms *g*, in combination with the governor for the purpose of operating steam valves, as substantially herein set forth.

64,501.—THOMAS DE WITT, Detroit, Mich.—*Carriage Spring and Coupling.*—May 7, 1867.—The half spring is hung on the over-curved ends of two short springs attached to the axle. The coupling pole is branched vertically before and horizontally behind a point traversed by the semi-circular backward extending segment on which it slides.

Claim.—First, the spring F having shoulder *f*² in combination with the spring D, and immediately secured to the axle E, substantially as described for the purpose specified.

Second, the coupling I herein described, the same consisting of the branches *i*², *i*³, *i*⁴, *i*⁵, in combination with the half circle H, constructed and arranged substantially as and for the purpose specified.

64,502.—ROBERT DICK, Buffalo, N. Y.—*Addressing Machine.*—May 7, 1867.—Improvement on his patent of October 4, 1859. The belt is combined with distributors and rollers revolving in fixed bearings, adapting the machine to the use of flour paste. The downward pressure of the frame resulting from dropping the machine on the outside to be labelled, performs the work of cutting off the label and attaching it to the required spot.

Claim.—First, the combination of the steam packing belt with the distributors and the new arrangement of the rollers for securing the results as recited, in the way and manner substantially as herein set forth.

Second, the spring wire frame and the manner of connecting it with the machine for the purpose stated, together with all other ways and manners, substantially the same as those herein set forth or intended to be set forth.

64,503.—ANDREW J. DINE, Xenia, Ind.—*Earth Auger.*—May 7, 1867.—The wings are jointed so as to allow the earth to pass under their rear ends or to allow the same to fall and act as a valve in raising the earth from the hole.

Claim.—A post hole auger constructed with the parts A D D' E E' F O G, arranged to operate substantially as set forth.

64,504.—THOMAS DIXCEE, Woodfield Road, England.—*Brick Machine.*—May 7, 1867.—The three operations of crushing, pugging or mixing, and molding are performed simultaneously, the plastic clay being forced through lateral orifices. The cutting wires are arranged at the required distance apart in the oscillating frame, the clay being held by the fences while being cut.

Claim.—First, the crushing or grinding rollers C in connection with the amalgamation or mixing blades D and the rollers C, at the moulding orifice or orifices, substantially as and for the purposes set forth.

Second, the cutting wires A attached to the bar K with the guide fences L L, combined and arranged to operate in the manner substantially as and for the purpose specified.

64,505.—A. B. DOOLITTLE, Hartford, Conn., assignor to ELI TERRY, Terryville, Conn.—*Machine for polishing Metal Springs.*—May 7, 1867.—From the burring rollers the spring is conducted between the burnishing rollers which act on the opposite surfaces of the spring simultaneously. It then passes through the bath of molten lead into which it is depressed by a roller. The bath has a blueing heat and the spring after leaving it is wound on a reel.

Claim.—The combination of the reels A E, burring rollers B, burnishing rollers C, and bath D, when all are respectively constructed and arranged to operate either in one and the same machine, substantially as and for the purpose described.

64,506.—FRANK B. DOUGHTY, New York, N. Y.—*Interfering Attachment.*—May 7, 1867.—The spur is inserted between the shoe and the hoof and holds in position the pad which is strapped around the hoof.

Claim.—Providing the pad with the metallic spur or spurs so arranged by means of which and the straps the pad is secured to the hoof of the horse as and for the purpose specified.

64,507.—J. F. DUBBER, Brooklyn, N. Y.—*Corset Fastening.*—May 7, 1867.—The metallic strips occupy folds in the edges of the corset. Slides are attached on each strip, those on opposite portions being hook and eye respectively.

Claim.—The slides C C' made with lips c c, to operate in combination with the springs A A' and seams B B', in the manner and for the purpose described.

64,508.—MICHAEL B. DYOTT, Philadelphia, Pa.—*Lamp.*—May 7, 1867.—The glass reservoir is suspended within an outer metallic casing which is attached by brackets to the metallic ring on which the upper shoulder of the recess rests; the recess is filled with cement. The intervening space forms a passage for the air.

Claim.—First, a reservoir or fountain of glass, earthenware, or other equivalent material suspended

within the outer metal casing B, substantially as and for the purpose herein set forth.

Second, the combination of the glass or earthenware reservoir A, metal ring D, brackets g, and outer casing B, the whole being arranged substantially as described.

Third, the cemented recess f, the projecting upper edge e of the same, and the ring D.

64,509.—FREEMAN ELLIS, Lafayette, Ohio.—*Fence.*—May 7, 1867.—The posts are attached on each side of the rails, their pointed ends penetrating the ground. Two braces pivoted together near the top secure the fence.

Claim.—First, a fence provided with the parts B, arranged and constructed so as to render it adapted for being inverted, that is, used either side up, substantially as and for the purposes set forth.

Second, the blocks j j', when arranged upon and confined with the pins h h, and pulleys i i, as and for the purposes specified.

64,510.—A. EMERSON, New York, N. Y.—*Machine for Making Nuts.*—May 7, 1867.—The heated bar is placed against a gauge, the slide is forced forward and the blank is cut from the bar; the blank is forced into the die to which the rounded header has been advanced by the movement of the other slide. The advance of the punch perforates the nut and forces the piece into the hollow opposite slide, whose second forward movement discharges the nut.

Claim.—First, the construction and arrangement of the slides I L, fitted in the guides H K of the frame B, and provided respectively with the dies J M, the punch N in the slide L, and fixed rod K in the slide I, when used in combination with an intermediate die open at both ends, substantially as described for the purpose specified.

Second, the construction of the die T with an enlarged centre when said die thus constructed, as used in connection with a punch arranged in connection with suitable dies, so that in the punching operation the blank will be expanded in the enlarged part of the die, substantially as and for the purpose set forth.

64,511.—BERNHARD EYBEL, New York, N. Y.—*Converting Motion.*—May 7, 1867.—The rotary shaft connects by eccentric pitman and bell crank with the lower shaft; the crank of the latter is attached to the slotted longer arm of the lever, and receives a reciprocatory rotary motion therefrom.

Claim.—The arrangement of the elbow lever F, eccentric C, and crank I, in combination with the shafts B H, substantially as and for the purpose set forth.

64,512.—BENJ. F. FARRAR, Springfield, Mass., assignor to himself, EDWARD M. WESSON and HENRY WILLIS, same place.—*Construction and Ventilation of Walls of Buildings.*—May 7, 1867.—The bricks are grooved longitudinally on their horizontal surfaces, and when laid together in the building the grooves form continuous horizontal air ducts.

Claim.—First, the walls of a house or other building, when constructed with horizontal air ducts c c c, such air ducts and their opening being arranged and combined substantially in the manner and for the purpose specified.

Second, a break or building block, when constructed with a channel or groove extending the entire length of one or both sides, as and for the purpose specified.

64,513.—HECTOR T. FENTON, Philadelphia, Pa.—*Steam Generator.*—The annular water space above the furnace has bent pipes which communicate with portions of the water space above and below, and project inward, nearly meeting in the center of the flue spaces, exposing their contents to the passing caloric current. Wire gauze screens guard the entrances to the pipes which lead to the elevated superheater.

Claim.—First, the cylindrical boiler, its fire box D, central flue C, and pipes E, the whole being constructed and arranged substantially as and for the purpose herein set forth.

Second, the combination of the above with a superheating chamber H, situated above the central flue and communicating through pipes with the steam space of the boiler.

Third, the boxes F, separated from the steam space

by wire gauze, or its equivalent, and pipes C, less in size than the boxes.

64,514.—C. T. FITCH, Harbor Creek, Pa.—*Post Driving Machine.*—May 7, 1867.—A weight is operated within the frame by means of an adjustable hook and rope.

Claim.—The combination of runners A, posts B, and braces C, with the hook I, inclined blocks F, sliding guide bar L, hammer E, adjustable arms O and P, and stop lever K, substantially as herein set forth for the purpose specified.

64,515.—W. A. FLANDERS, Shelby, Ohio.—*Bee-hive.*—May 7, 1867.—The passages permit the bees to pass more directly to the different compartments. The sanded surfaces prevent the deposition of wax at those points. The other features refer to ventilation and protection.

Claim.—The ways or passages G for the bees commencing at one side of the comb guides, and passing through the top bars of the comb frames, substantially as and for the purpose set forth.

Second, the use of sanded surfaces for the comb frames, as and for the purposes set forth.

Third, the use of glassed or sanded paper for comb guides M and linings to the communicating bee passages A' from comb to comb, substantially as and for the purposes set forth.

Fourth, ventilating the hive through the top bars of the outside comb frames and preserver H, constructed as described, from the diverging ways W and doors X and Y of the common entrance, as and for the purposes specified.

Fifth, the bee entrance guard V, having diverging passage ways W, from the central or common ingress Y, the same being either reversible or stationary, as and for the purposes set forth.

64,516.—HENRY C. FRITZ, Philadelphia, Pa.—*Shaft Coupling.*—May 7, 1867.—The adjacent ends of the shafting are clamped between grooved blocks, which are forcibly drawn together by screw bolts and encased in a sleeve.

Claim.—A coupling divided into parts longitudinally when bolted together by bolts or screws through the flanges, in combination with the sleeve or cover H, substantially as shown and described.

64,517.—JOSEPH GALLIPO, Cohoes, N. Y., assignor to himself and WALTER CAMPBELL, same place.—*Apparatus for Crutching Soap.*—May 7, 1867.—The dasher arms have angular and oblique paddles, which, by revolution, mix the material into a homogeneous mass.

Claim.—The arrangement of the radiating paddles e, beater frame f, transverse scrapers g, cross-bars h, and transverse paddle i, in combination with the revolving shaft D and box A, constructed and operating substantially as and for the purpose set forth.

64,518.—JOEL GARFIELD, Groton, Mass.—*Hay Spreader.*—May 7, 1867.—The rotary and eccentrically moving teeth are mounted in an open frame. They clear themselves of hay by their eccentric motion.

Claim.—In combination with rotating heads and forks and the stationary shaft k placed eccentrically to the axis of rotation of such heads, the shafts h, arms l, and loops m, when arranged to operate substantially as described.

64,519.—WILLIAM L. GEBBY, New Richland, Ohio.—*Planter and Cultivator Combined.*—May 7, 1867.—The large shovel opens the ground, the attendant operates the drill by the connecting lever, and the small shovels in the rear cover the seed.

Claim.—First, the arrangement of the arms I with the shovel K and teeth d, in combination with the shaft A and beam B, in the manner and for the purposes specified.

Second, the hopper box D, with seed slide i, when operating by means of the lever b, rods c and g, and spring e, when constructed and used in the manner herein set forth.

64,520.—WILLIAM F. GOODWIN, Washington, D. C.—*Harvester Rake.*—May 7, 1867.—The rake is

operated by a cog wheel on the axle which turns with it, but has sliding movement on the same; another cog wheel engaging with the former is brought to engage any one of a series of variously sized cog wheels to regulate the speed of motion of the rake. The rake is raised in its forward sweep by the roller on a projecting arm, said roller running up an inclined track. The finger bar and platform are hinged to the frame to allow its accommodation to inequalities of ground.

Claim.—First, the jointed lever, consisting of arms A⁴ and A⁵ for communicating motion from gearing on the main frame to a rake mounted on the hinged finger bar or platform, arranged and operating substantially as described.

Second, the reciprocating bar B, arranged in the described relation to the grain platform, in combination with the vibrating arm A³ and the rock shaft B² in the hollow post P, or their equivalents, substantially as and for the purpose specified.

Third, the bar A³, arms A⁴ and A⁵, bar B, shaft B² in the hollow post P, crank arm B³, link B⁴, crank arm B⁵, shaft B⁶, post B⁷, rod R¹, projections R², projecting arm M, track E, and switches T and T¹, combined and arranged to operate in the manner and for the purpose substantially as described.

Fourth, the post P, having a hole made through it to receive and support the shaft B², in combination with the projecting arm N flattened on the top of said post P, substantially as and for the purpose described.

64,521.—WILLIAM F. GOODWIN, Washington, D. C.—*Harvester Rake.*—May 7, 1867.—The rake is connected to an oscillating frame, and has connecting rods to a roller which runs on a cam-segment to raise the rake in its forward sweep; the roller is tripped from the cam and descends to the platform for the effective sweep.

Claim.—First, the swinging bent arm H' mounted on the projecting arm of post P, arranged and operating substantially in the manner and for the purpose described.

Second, the sliding bar M, rods C C', and crank arms K K², or their equivalents, operating in connection with the swinging arm H and rake R, substantially as and for the purpose described.

Third, the sliding bar M, provided with roller E, arranged as described, and operated by the track T, substantially as and for the purpose described.

Fourth, the track T, switches S S, and yielding lever L, arranged and operating substantially in the manner and for the purpose described.

Fifth, the lever L, post J, spring J', and stud O, arranged and operating substantially as described.

64,522.—WILLIAM F. GOODWIN, Washington, D. C., and ARTHUR W. BROWNE, Brooklyn, N. Y.—*Harvester Rake.*—May 7, 1867.—The rake is hung on a pendent arm upon an oscillating horizontal tubular rod, which contains an inner rod by which the rake is swung up during its backward stroke.

Claim.—First, the plate P with its recess W, the projecting stud U on the cam M, and the rod T, combined and arranged to operate in the manner and for the purpose substantially as described.

Second, crank S, rock shaft S, crank arm C¹, link C², crank arm C, rock shaft B¹, crank arm B³, rod B⁴, and crank arm B⁵, combined and arranged to operate in the manner and for the purpose substantially as described.

Third, the projecting arm O², track F with its notches E E, pawls q and q², pins q¹ and q³, and hollow arm B, combined and arranged to operate in the manner and for the purpose described.

64,523.—WILLIAM F. GOODWIN, Washington, D. C., and ARTHUR W. BROWNE, Brooklyn, N. Y.—*Harvester Rake.*—May 7, 1867.—The reel consists of bars upon chains or belts running on rotary pulleys.

Claim.—The pulleys A and A³, shaft B, chains I, bars O, and projections R and R¹, adjustable on the posts S S¹, combined and arranged to operate with the pulleys A¹ and A², in the manner and for the purpose substantially as described.

64,524.—LUKE GORE, Newburg, Ohio.—*Sap Spout.*—May 7, 1867.—The spile is of sheet metal; the portion to be driven into the tree is taper and

tubular, the other an open trough; the nib assists in holding the suspended bucket.

Claim.—The herein described sap spout, when constructed in the manner specified, as a new article of manufacture.

64,525.—JOHN GRAHAM, New York, N. Y.—*Loom.*—May 7, 1867.—The filling thread is carried double across the shed by a reciprocating eye-pointed thread-carrier, and then locked at the opposite selvage by passing a shuttle and its thread through a loop of such filling thread; the loop is spread by the movement of the thread-carrier across the web.

Claim.—The shuttle at the side of the shed and the reciprocating filling thread-carrier, arranged in combination with the lay and reed, so that the filling thread-carrier crosses the shed at such distance from the cloth-making point (or extreme range of motion of the reed in beating up the filling) as to carry the filling-thread diagonally across the shed and shuttle-*race*, substantially as and for the purpose described.

64,526.—JONATHAN H. GREEN, Christiansburg, Iowa.—*Heating Stove.*—May 7, 1867.—The grate forms the ceiling of the ash chamber, the sides of the latter are slotted and have registering damper plates.

Claim.—The arrangement of the grate C above the bottom of the stove whose sides are open or slotted, and provided with dampers P to register therewith, and operating substantially as described, as and for the purpose specified.

64,527.—ROBERT ANTHONY HARDCASTLE, New-castle-upon-Tyne, England.—*Differential Pulley Block.*—May 7, 1867.—Explained by the claims and illustration.

Claim.—First, the application and use of a sliding clutch, for the purpose of coupling and uncoupling the sheaves in differential pulley blocks, substantially in the manner hereinbefore described and illustrated by Fig. 1 of the drawings.

Second, the application and use of a sliding clutch, for the purpose both of coupling or uncoupling the sheaves in differential pulley blocks, and of locking one of such sheaves, as hereinbefore described and illustrated by Figs. 11, 12, and 13 of the drawings.

Third, the application and use of lateral eogs, pins, projections or teeth on one sheave, in combination with a fixed stop or catch on the frame of the pulley block, both for the purpose of coupling and uncoupling the sheaves in differential pulley blocks, and simultaneously locking one of such sheaves, substantially as and for the purpose hereinbefore described and illustrated by Figs. 3, 4, 5, 6, 7, and 8 of the drawings.

Fourth, the application and use to and in differential pulley blocks of a sliding clutch or a sliding sheave, in combination with a lever cord wedge or spring for producing the necessary motion for coupling and uncoupling and locking the sheaves, substantially as hereinbefore described and illustrated by Figs. 1, 2, 3, and 4 of the drawings.

Fifth, the application and use in differential pulley blocks of one or more spiral projections or threads, formed on the spindle or axis of the sheaves, and being in combination with inclined teeth or projections on one of the sheaves, and on the frame on the pulley block, for the purpose both of coupling and uncoupling the sheaves, and locking one of such sheaves as hereinbefore described and illustrated by Figs. 9 and 10 of the drawings.

64,528.—CYRUS H. HARDY, Charlestown, Mass., assignor to himself and GEORGE JACQUES, Boston, Mass.—*Bed Bottom.*—May 7, 1867.—The mattress rests on the heads of pins, which traverse the frame vertically, and are supported on springs beneath.

Claim.—The series of coiled lever springs E, operated by pins D or their equivalents, substantially in the manner and for the purpose set forth.

64,529.—W. F. HELLEN, Washington, D. C.—*Skate Sharpener.*—May 7, 1867.—The slotted adjustable plate is fastened by set screws, and forms guides for the adjustable file on each side of the runner.

Claim.—The slotted guide plate B, with the adjustable screws D and set screw E, combined with an adjustable file of any required size, when constructed, arranged, and operated as herein described and for the purposes set forth.

64,530.—EDWARD DRUCKER, Paris, France.—*Corset.*—May 7, 1867.—The corset is made in circumferential, instead of vertical, sections; the bust and hip sections are connected by a waist section, dispensing with gores; the sections are maintained in position by whalebones, &c.

Claim.—An improvement in corsets of the class in which the seams run transversely, instead of up and down, such improved corset or other similar article being made of two or more sections, united by an intermediate section having substantially the outline and conformation shown and described.

64,531.—DAUPHIN S. HINES, Brooklyn, N. Y., assignor to JOHN J. CROOKE, New York, N. Y.—*Making Tin Coated Foil.*—May 7, 1867.—The tin pipe of the requisite proportions is placed in ice water, and filled with molten lead. The ingot is then rolled to the required thickness.

Claim.—Forming the ingot by pouring molten lead into a tin pipe, while immersed in a cooling medium, substantially as described, in combination with the after process of rolling as set forth.

64,532.—ALFRED HOBBS, West Cambridge, Mass.—*Steam Engine Slide Valve.*—May 7, 1867.—The convex side of the valve is toward the cylinder, and its ports nearly opposite, so that the top pressure is nearly balanced by the pressure on the lower surface.

Claim.—A semicircular balanced slide valve, constructed and operating substantially as and for the purposes herein specified.

64,533.—WILLIAM S. HUDSON, Patterson, N. J.—*Locomotive Truck.*—May 7, 1867.—The locomotive has a swivelled truck at each end calculated to accommodate themselves to bends of the road.

Claim.—First, the two trucks M N, constructed and arranged as represented and mounted at opposite ends of the locomotive substantially as and for the purpose herein specified.

Second, in connection with the above, the within described arrangement of the equalizing levers H h, so as to equalize between the rear drivers C, and the top portion of the truck N, and allow the lateral movements of the main body of the latter without disturbing the action of the equalizing levers, substantially as herein set forth.

Third, the equalizing lever G g and cross lever E, mounted on the front of the locomotive and arranged relatively to the truck M, and forward drivers D, substantially as represented so as in connection with the lateral moving truck N, at the rear and the equalizing levers H h, connected therewith to support the weight on the three points g h h, on independently equalizing systems of levers and wheels, substantially as and for the purpose herein set forth.

64,534.—ANDREW HUNTER, San Francisco, Cal.—*Amalgamator.*—May 7, 1867.—The bottom of the box is laid alternately with bars of metal and wood. A block is suspended from a frame and carries a series of transverse blocks shod with iron. The shoes of the frame are reciprocated in contact with the table by a crank. An agitator is attached to the frame and stirs the amalgam as it passes to the vibrating copper-covered table.

Claim.—First, the box A, with sides and ends lined with copper in combination with the blocks B B, and the dies C C, substantially as described.

Second, the frame E, with shoes or mullers D D, suspended to frame F, by rods or bars G G, or their equivalent worked by rod J, and crank or eccentric K, as hereinbefore set forth.

Third, the movable frame F, with adjusting screws I I, or their equivalent for adjusting mullers D D, to any desired height.

Fourth, covering the tops of the mullers D D, with copper.

Fifth, box L, with frame M, set with skimmers and agitators, substantially as described and for the uses and purposes as hereinbefore set forth.

Sixth, table O, with steps covered with copper plates, with side vibratory motion as given by driver P and rod Q.

Seventh, the box A, lined with copper plates, in combination with blocks B B, dies C C, mullers D D,

adjusting or movable frame F, screws I I, rod J, crank or eccentric K, box L, and frame M, with agitators or skimmers, substantially as described, and for the uses and purposes as hereinbefore set forth.

The last described combination in connection with the table O, with its side-vibrating motion, substantially as described and for the uses and purposes as hereinbefore set forth.

64,535.—JOSEPH HYDE, Troy, N. Y.—*Folding Chair*.—May 7, 1867.—The chair has mainly three surfaces connected by jointed strips. It is adjustable in form of a couch or chair, and may be folded in small compass for carriage.

Claim.—First, the connecting and disconnecting of the legs G, or F, from the main part or body of the chair or couch in the manner, and by the means, or equivalent means, herein specified, thereby allowing the said chair or couch to be folded in a compact form, without disconnecting the back, seat, or apron from each other, substantially as herein described and set forth.

Second, the employment of the circular hook or latch fastening M, arranged in combination with the legs or other suitable part of a folding chair or couch, and operating in the manner and for the purposes substantially as herein specified and set forth.

Third, the rollers R, in combination with the foot board P and apron E, of a folding chair or couch when arranged in the manner and for the purposes substantially as herein described and set forth.

64,536.—ISAAC B. HYMER, Warsaw, Ind.—*Rail-road Rail*.—May 7, 1867.—The base piece has foot flanges and a vertical rib which supports the shank of the T-rail; side plates rest against the rib and shank and are secured by bolts. The sides of the rib and shank are grooved to reduce the contracting surface.

Claim.—The arrangement of the T-rail imposed upon the foot-rail and the two side plates bolted thereto the contracting face of the shank a, rib b, and side plates C, being grooved as described and represented.

64,537.—G. L. GAEGER, New York, N. Y.—*Machine for making Paper Bags*.—May 7, 1867.—The movable metallic "former" has movable flaps which turn the blank over the former, holding it in position. The "former" has a ridge where the edges of the blank are to be joined, insuring increased pressure thereon.

Claim.—The former B, in combination with the table A, gauge C, and flaps D D', worked and operating substantially as and for the purpose described.

Also the notch e, in the edge of the former to facilitate the operation of removing the finished bags from said former as set forth.

64,538.—SAMUEL W. JAMISON, New York, N. Y.—*Boot Crimping Machine*.—May 7, 1867.—The leather is placed on the tree and crimped by parallel plates which pass up and down on each side of the tree.

Claim.—First, the combination in a machine for crimping boots, having a stationary tree or form of the crimping plates with the brackets for supporting the same, under the arrangement herein described so that the said plates may adjust themselves vertically or laterally to the varying thickness of the leather or tree upon which it is placed substantially as shown and set forth.

Second, the combination with the crimping plates and brackets for supporting the same of the laterally self-adjusting ways between which the said brackets slide, the said ways being actuated by weights, springs, or equivalent mechanism to exert a continuous but yielding pressure upon the said crimping plates as herein shown and described.

Third, the method of supporting the said crimping plates, and the supporting brackets moving between laterally self-adjusting ways as described, from a cross head or beam sliding between the sides of the machine, and receiving motion, through the medium of gear or lever or other suitable mechanism, substantially as herein shown and set forth.

Fourth, the combination with the self-adjusting ways or uprights of the levers and rods connecting the same with both the said uprights and the weights,

under the arrangement and for operation substantially as shown and set forth.

64,539.—THOMAS J. JONES, Madison, N. J.—*Water Ejector*.—May 7, 1867.—Branch connections between the upper end of the induction pipe and the lower end of the delivery pipe permit the steam pipe to be placed in line with the latter.

Claim.—The pump constructed as herein described and shown, as a new article of manufacture.

64,540.—PETER M. KAFER and JOSEPH M. DE LACY, Trenton, N. J.—*Feed Water Heater*.—May 7, 1867.—A stationary heater charges the boiler of the fire engine. The fire damper is adjusted by connection to the piston of a small steam cylinder, to whose lower end steam is admitted.

Claim.—A water heater for steam fire engines, constructed substantially as shown and described, combining in its arrangement the regulating cylinder N, operating upon the damper substantially as set forth.

Also, the pipes B B', and the rubber or elastic pipes K, with their cocks, levers and chains, the slip joint at L, and the slip key E', constructed, arranged and operating substantially as described and for the purposes specified.

64,541.—WATSON KING, Springfield, Ill.—*Railway Track Cleaner*.—May 7, 1867.—The wheel guards and brake shoes are operated by means of eccentrics upon the axles connected by means of chains and rods with the brake wheels on the platform.

Claim.—First, operating the shields D, and brake shoes G, by means of the eccentrics H, upon the shaft C, substantially as herein shown and described for the purpose specified.

Second, in combination with the parts of the above, the rods I, cross bar J, chains K P, friction roller L, cross bar O, and openings S T, as herein set forth for the purpose specified.

64,542.—EDMOND H. KNIGHT, Unadilla, Mich.—*Cultivator*.—May 7, 1867.—The beams of the double plows are pivoted to the axle and connected by rods to the levers by which their vertical adjustment is effected; foot levers keep the plows to their work and give the lateral adjustment.

Claim.—First, the beams G, having plow and shovel standards H, pivoted to them in combination with the frames F F, the beams and frames being secured to the axle A, and used in connection with hand levers K, foot levers S S, and catches R V, all arranged to operate substantially in the manner and for the purpose set forth.

Second, the springs H* connected with the beams G, and attached to the frames F, substantially as and for the purpose specified.

64,543.—A. KOMP, New York, N. Y.—*Machine for Clasping Hooks to Ladies' Skirts*.—May 7, 1867.—The spangles pass by a spout to the guide, which delivers them consecutively to the carrier; this is on the end of an oscillating bar which carries the spangle, points downward, to the anvil, when they penetrate the tape and are clinched by the descending hammer.

Claim.—First, reversing the spangles by the action of the spangle carrier, substantially as shown.

Second, the slotted spring receiver g, in combination with the swinging spangle carrier E, constructed and operating substantially as and for the purpose described.

Third, the lips f, on the spangle guide D, in combination with the slotted spring receiver g, and oscillating spangle carrier E, constructed and operating substantially as and for the purpose set forth.

Fourth, the bell crank lever m and stop n, in combination with the spring receiver g, oscillating spangle carrier E, and hammer H, constructed and operating substantially as and for the purpose described.

64,544.—HIRAM Y. LAZEAR, New York, N. Y.—*Gas Burner for Heating Purposes*.—May 7, 1867.—The gas passes from the annular chamber through perforations in the cylinder, and the flame impinges upon the axial tube and heats the air therein.

Claim.—The combination of the supporting tube

A, trough B, dish C, and perforated cylinder D, with the central air tube operating as described, for the purpose specified.

64,545.—L. E. LEE and C. MUDGE, New Orleans, La.—*Turn Table for Railroads.*—May 7, 1867.—As the car runs on to the track, the detents of the turntable are disengaged, and the latter is rotated by the team attached to the car, the brake on the latter being applied to prevent its being moved longitudinally.

Claim.—The combination of projecting points, $b\ b'$ and $g\ g'\ g''$, and the openings or recesses into which they enter, the pivoted levers $c\ c'\ c''$ and d and $f\ f'$, with a railroad turn-table, when the said parts are constructed and arranged for conjoint operation, substantially as described, for the purpose set forth.

64,546.—TRISTAM S. LEWIS, Chelsea, Mass.—*Well Tube.*—May 7, 1867.—The transverse perforated tubes in the lower section are filled with a soluble material and occupy the space while the tube is being driven, excluding sand, &c., till the tube attains the required depth.

Claim.—The tube A, provided with one or more short perforated tubes b , operating substantially as described for the purpose set forth.

64,547.—ELIJAH LINDSLEY, Neenah, Wis.—*Car Coupling.*—May 7, 1867.—The link enters the opposite draw-head, the bumper strikes the end of the slide, and the pin drops into place.

Claim.—The sliding bar B, with its slot b , and pivoted pin A, playing into the tapering slot D, and fastening into the hole in the spring plate on top of the coupling, substantially in the manner and for the purposes described.

Also, in combination with the said slide and pin, the said spring plate and lever, and other parts of the said coupling, substantially as set forth.

64,548.—JOHN MCCREARY, Middletown, Pa.—*Gate.*—May 7, 1867.—The gate travels longitudinally nearly its whole length on a sheave journaled on a bracket attached to the post. Recesses in the vertical brace-bar permit the sheave to pass.

Claim.—A gate having a central cross-bar E, with the recesses formed on its inner surface, when used in combination with the grooved and swiveled roller d , and the right-angled hook f , substantially as shown and described.

64,549.—A. Y. McDONALD, Dubuque, Iowa.—*Well Tube.*—May 7, 1867.—The successive courses of wire act as a filter or sand screen.

Claim.—The pipe A, perforated as described and wrapped with the coarse wire after being first wound with the finer wire, in the manner substantially as and for the purposes specified.

64,550.—WM. H. MCPHERSON, Danby, N. Y.—*Horse Rake.*—May 7, 1867.—The tubular axle is also the rake-head, and the teeth are secured thereto by a double right-angled bend at their upper ends, held in position by means of bolts; the device for tilting the rake consists of a cogged wheel upon the axle, operated by a second and similar wheel having a hand rim by which it is revolved.

Claim.—First, the revolving tubular head J, provided with the teeth H' and H'' , in combination with the cam wheel E, spring stud D, and lever C, substantially as and for the purposes described.

Second, the combination of the teeth H' H'' , having a double right-angled bend at their upper ends, the bolts P, and head J, substantially as and for the purposes described.

Third, the use of the wheels I and K, acting on the head J, and moved by the hand rim L, or its equivalent, for the purposes set forth.

64,551.—P. L. MILLER, Mechanicsburg, Pa.—*Gate.*—May 7, 1867.—The gate is operated by levers projecting horizontally from posts within reach of a person on horseback or in a carriage. A counterbalance lever is actuated by the opening devices and governs the latch.

Claim.—First, the end piece G, provided with slotted arms G' , in combination with levers $F\ F'$, pin I, and rods $J\ J'$, as and for the purpose set forth.

Second, the rod J, provided with an enlargement or enlargements $a\ a'$, substantially as and for the purpose described.

Third, the pivoted latch K, in combination with the lever H, rod L, rod J' , and bracket d , as and for the purpose described.

Fourth, the combination and arrangement of the posts A D D' E E', and bed piece, substantially as and for the purpose set forth.

64,552.—D. L. MILLIKEN, Brattleboro, Vt., and O. M. PILLSBURY, Claremont, N. H.—*Joint for Stove Pipes.*—May 7, 1867.—The ends of the stove pipe sections are matched together and clamped by an enclosing band or sleeve which is tightened by a set screw.

Claim.—The adjustable band B, provided with circumferentially swaged grooves b , fitting over the corresponding heads c , near the ends of the sections A, of the stove pipe, as herein shown and described for the purpose specified.

64,553.—H. C. MOORE, Springfield, Mass.—*Peat Machine.*—May 7, 1867; antedated March 26, 1867.—The pressing rollers, heated by steam, receive the peat from a hopper above and deliver it to an endless belt which carries the peat under the die receiving an intermittent motion from a drum. The die falls at intervals upon the peat, which is sustained by a plate beneath the belt. A series of plungers slide within the die and press the blocks after they are cut. The blocks are carried forward by the belt and discharged.

Claim.—First, the combination of the die and press so as to co-operate with each other to cut, press, and shape the peat to the desired form, substantially as herein set forth.

Second, the combination of the endless belt E and plate F with the die A and press B, the parts arranged so as to operate automatically, substantially as and for the purpose herein described.

Third, the arrangement of the box L, for the peat to pass through, so formed as to gage the amount passing through to the proper height for the movement of the die, substantially as set forth.

Fourth, for the purpose of moving the press A, the arrangement of the slotted lever m and crank k on the shaft H, substantially as set forth.

Fifth, for the purpose of moving the die, the combination of the slotted levers $c\ c'$ and cams $b\ b'$ upon the shaft H.

Sixth, operating the draw K, by the ratchet motion arranged and operated by means of the lever n and cam T upon the shaft H, substantially as herein set forth.

Seventh, in a peat machine, the combination of rolls for grinding, an endless belt for conveying the peat, and die and press for shaping and compressing the same, substantially as herein described.

Eighth, the arrangement of the openings X X', as described, for the purpose of letting out the steam confined within the rolls intermitently.

Ninth, the box or cap X', in combination with the die A, for the purpose of holding the steam used for warming the die and peat operated by it, substantially as herein described.

Tenth, warming the die A and plate F, upon which the peat is pressed and formed, by means of steam or hot air, substantially as set forth.

64,554.—JOSEPH MOORE, San Francisco, Cal.—*Friction Pawl.*—May 7, 1867.—Spring pawls are socketed in the arms attached to the shaft, and fall consecutively into the notches inside the surrounding case, so as to prevent back motion.

Claim.—A stop apparatus for hoisting machinery constructed with the pawls Q Q Q, moving with the shaft P, and the ratchet case R turning loosely upon said shaft, together with the brake beams L L, levers T and V, and weight Z, constructed and operated substantially as and for the purpose described.

64,555.—PIERRE B. MONGEOT, Paris, France.—*Manufacture of Soap.*—May 7, 1867.—Excess of soda is removed by adding under the crusher a sufficient amount of pulverized colophony.

Claim.—Manufacturing the above described soaps, which go by the names of anhydrous rectified soaps, illustrated soaps, double-faced soaps, obtained by one

and the same process, that is to say, with anhydrous soap, which alone allows of the fabrication of a block or cake composed of parts of different nature, colors, and perfumes united together in the manner of mosaic work, as and for the purposes described, viz., having in one and the same block or piece heterogeneous soaps made to answer various purposes, or variously illustrated and perfumed soaps, substantially as described.

64,556.—JOHN MULCHAHEY, Springfield, Mass., assignor to himself and CHARLES MULCHAHEY.—*Belt Punch.*—May 7, 1867.—The punch is worked in the ordinary manner between a pair of jaws working on a central rivet; a pair of pliers pull the lacing through the belt. One of the jaws has a knife blade. An awl and a bodkin for pushing the lacing through the hole are attached as required.

Claim.—The arrangement of the awl M, projections H H', knife K, spring hook O, and bodkin S, upon and in connection with a belt punch, substantially as set forth.

64,557.—P. M. MEYERS, J. W. WALSER, and JOHN SPANGLER, Canton, Ohio.—*Beehive.*—May 7, 1867.—Antedated November 7, 1866.—The hopper is intended to protect the bees from the moth, the bee valve is used to divide the bees when driven from one part of the hive to the other.

Claim.—First, the use of the four pieces C C D D forming a complete hopper C C D D, when the pieces C C are movable in grooves a a, substantially in the manner and for the purpose specified.

Second, the peculiarly formed bee valve N used in connection with the openings R, substantially in the manner and for the purpose specified.

Third, the peculiar combination and arrangements of double box A having the boxes H H, honey boxes K K K K, ventilators X, opening E E, slides F F, openings R R, hoppers C C D D, drawers O, doors B B and I I, arranged on each side thereof, and cover G, substantially in the manner and for the purpose specified.

64,558.—CARLTON NEWMAN, San Francisco, Cal.—*Pot for Melting Glass.*—May 7, 1867.—The pot is shaped like those for flint glass; it has a top opening for the calorific current which passes off through two side flues. Two upper flues furnish heated air at the top opening to cause complete combustion. The charging opening is closed by a slab.

Claim.—First, a pot A constructed with the opening F and flues D D or their equivalents, substantially as and for the purposes described.

Second, the flues H H or their equivalents, constructed and arranged substantially as and for the purpose described.

64,559.—E. F. OLDS, South Lyon, Mich.—*Field Roller.*—May 7, 1867.—The tongue is pivoted on a disk attached to the frame to avoid turning the roller at the end of the bout, and is rigidified by a lever pivoted to the tongue and held by a spring in a notch in the disk.

Claim.—First, the disk A, pole G, lever H, and spring I, as arranged in relation to a field roller, in the manner substantially as described.

Second, rollers D, spring E, and frame B, in combination with the disk F, pole G, lever H, and spring I, in the manner and for the purpose set forth.

64,560.—L. M. OSBORN, Hamilton, N. Y.—*Combined Wagon Brake and Dumping Device.*—May 7, 1867.—When the locking latch is detached from the reach and the rear wheels chocked, the horses may back the box over the rear axle to dump it. The outer ends of the toggle levers are pivoted to the brake blocks and jointed to the brake bar, so that a backward pressure on the joint in descending a hill applies the brakes to the wheels.

Claim.—First, a wagon which dumps itself by approximation of its front and rear wheels; the employment of a self-acting brake which is constructed substantially as described, and connected to the front section D' of the extensible reach by a locking latch or its equivalent, substantially as described.

Second, the transverse releasing lever g' in combination with the latch or hook g, and a self-acting brake, substantially as described.

Third, the combination of brake bar F, toggle or knee levers e e, pivoted blocks f, and brake shoes f' with an extensible reach D D' and a fastening g, substantially as described.

Fourth, the brace strap c applied to the front running gear by the king bolt b, and adapted for sustaining the same when backing, substantially as described.

Fifth, the sliding brace d and stops d' d² applied to the reach sections D D', substantially as described.

Sixth, the connecting rods P applied to the wagon body and front running gear, in conjunction with the rolling supports G G and the extensible reach D D', substantially as described.

64,561.—PHILIP A. PAGE, Palmer, Mass., assignor to himself, WM. BROOKS and ALBERT LOOMIS, same place.—*Die for Swaging Calks for Horse Shoes.*—May 7, 1867.—The die piece is inserted into a socket in the metallic block and bolted thereto.

Claim.—A toe calk die constructed with the piece B arranged in the block A, substantially as set forth.

64,562.—FRANÇOIS PETITDIDIER, Paris, France.—*Applying Designs in Relief and Brilliance to woven Fabrics.*—May 7, 1867.—Melt copal 6 lbs., and add linseed oil 3 lbs., heated to 270° Fah., after cooling add essence of turpentine 9 lbs. For printing 75 parts of the above are mixed with 25 parts ivory black.

Claim.—The application or production of designs upon and giving brilliancy to fabrics, by printing with resinous materials, substantially as herein specified.

64,563.—EDWARD PHIFER, Trenton, N. J.—*Cultivator.*—May 7, 1867.—The plow beams are adjusted laterally on the axle and the plows vertically by the hand lever and spring detent. The front ends of the drag bars are adjustable in the down hangers to vary the line of draft. The tongue can be adjusted laterally.

Claim.—First, a cultivator frame composed of a series of timbers shorter than the diameter of the wheels and arranged parallel to the tongue, substantially as described.

Second, the combination substantially in the manner described of a tongue laterally adjustable on the axle with a series of frame timbers of a length less than the diameter of the wheels, arranged parallel to the tongue and adjustable laterally on the main axle.

Third, the combination, substantially as described, of the tongue and short parallel frame timbers with a series of slotted adjusting plates attached to the front of the frame timbers and secured to the tongue.

Fourth, the combination, substantially in the manner described, of the parallel frame pieces arranged for adjustment in pairs with the slotted downhangers, front lifting rods, and drag bars, for the purpose of adjusting the front ends of the drag bars.

Fifth, the combination of the frame pieces, down hangers, drag bars, lifting rods, hand levers, and sector rack, when arranged, substantially as described, for the purpose of enabling the driver to control each pair of plows by a single lever.

Sixth, the arrangement of the sector rack, hand lever, and spring detent as described, whereby the catch acts both as a detent for the lever and as a guide to keep it parallel with the sector rack.

64,564.—LEONCE PICOT, Hoboken, N. J., assignor to WILHELMINE PICOT, same place.—*Hollow Articles of Rubber and other Flexible Materials.*—May 7, 1867.—The ball has a tube by which it is inflated; the end of the tube is turned down into a recess at its root to prevent the escape of air.

Claim.—The application to an India-rubber ball or other hollow article required to be distended by inflation, of a flexible tube in the manner as herein specified, so that the said ball or other article may be either inflated and distended or collapsed, as and for the purposes set forth.

64,565.—EDWIN R. POWELL, Cambridge, Vt.—*Attaching Thills to Vehicles.*—May 7, 1867.—The thill is pivoted in the chambered block, and is secured from rattling by a rubber spring in its rear, which is held in position by a projection from the cap. The hinged cap when raised is supported by a spring while the thill is being attached.

Claim.—First, an improved thill coupling formed by the combination of the chambered block A, spring D, and the pivoted plate or cap C, having projections c^1 c^2 and c^3 , formed upon its under side, substantially as herein shown and described and for the purpose set forth.

Second, the combination of the India-rubber block spring E, or equivalent, with the chambered block A and cap or block c, substantially as herein shown and described and for the purpose set forth.

64,566.—SEYMOUR PRATT, Fayetteville, N. Y.—*Roofing.*—May 7, 1867.—Explained by the claim.

Claim.—A roofing composed of the tiles D, constructed as described, placed on a bed of cement C, laid on the boards or lathes B, substantially as herein shown and described.

64,567.—THOMAS F. PRESTON, Pawtucket, R. I.—*Power Hammer.*—May 7, 1867.—Improvement on the patent of Thomas Shaw, February 27, 1866. The hammer is suspended on a rod having a shoulder against which springs bear to prevent jar in either the up or down stroke. The guides are made in separate pieces so that they can be adjusted after wear.

Claim.—First, the connecting rods E and D, in combination with the springs e and f , shoulder d , and slotted hammer (or extension of the same) F, substantially as and for the purpose herein shown and described.

Second, the construction and arrangement of the adjustable guide C let into the guide brace G, and provided with a lip upon each end fitting over the upper and lower sides of said guide brace G, its center grooved to receive the sliding guide rail b in the hammer F, substantially as herein described and for the purpose specified.

64,568.—H. D. RICHARDSON, Northampton, Mass., assignor to himself and ROBERT RUSSELL, same place.—*Lock.*—May 7; antedated April 24, 1867.—The cylindrical case sets within the door and has a circular keyhole on each side. An interior cylinder may be revolved within the other, having one hole which may be brought into correspondence with either of the others being revolved by the square on the reverse end of the key.

Claim.—First, a lock constructed and arranged substantially as described so that the keyhole can be brought to either side of the door leaving no entrance to the lock on the other.

Second, the arrangement of the two cylinders B and K, with the keyholes e and g , in the manner and for the purpose substantially as described.

Third, the combination of cylinders B and K, rack C, pinion H, spring E, one or more tumblers a a and bolt A, in the manner and for the purpose substantially as set forth.

Fourth, a lock constructed and arranged substantially as described, so that the keyhole can be brought to either side of the door leaving no entrance to the lock on the other.

64,569.—ALFRED RIGNEY, New York, N. Y.—*Fire Escape.*—May 7, 1867.—The jointed ladder is wound on a reel, and as it is unwound it passes up between guides and rollers; sleeves are brought by springs over the joints to make them inflexible, pawls prevent retraction of the ladder.

Claim.—First, the flexible ladder H, arranged in a box or case A, so that it can be wound around a drum or roller or be straightened for use as may be desired, substantially as herein shown and described.

Second, the strap or bolt F, when arranged as described in combination with the flexible ladder H, all made and operating substantially as herein shown and described.

Third, the springs I I, when arranged as described in combination with the sleeves O and hinged side pieces n n , all made and operating substantially as and for the purpose herein shown and described.

Fourth, a fire escape made and operating substantially as herein shown and described.

64,570.—HENRY M. RITTER, Cincinnati, Ohio, assignor to M. GREENWOOD & Co., same place.—*Reversible Knob Latch.*—May 7, 1867.—The rectangular part of the latch is held in a similar socket of the case, and

may be withdrawn therefrom for reversal of the latch from left to right, or vice versa. The operating yoke of the latch has a forward projection which is thrown up to allow this reversal. One of the usual screws prevents this action when inserted, and must be removed to allow it.

Claim.—In the described combination with the hub B, guiding stump M, and the spring P, the reversible latch I J, adapted for retention to a right or left position by direct contact of its yoke C K, with one of the wood screws employed to fasten the lock to the door, substantially as set forth.

64,571.—HENRY M. RITTER, Cincinnati, Ohio, assignor to M. GREENWOOD & Co., same place.—*Reversible Knob Latch.*—May 7, 1867.—Explained by the claim and illustration.

Claim.—The reversible latch A D, whose reversible collar B occupies a corresponding socket C, and whose flat two-sided tail G is tangential to one of the screw holes in both positions of the latch, so as to render the latter irreversibly by the direct contact of the holding screw, substantially as described.

64,572.—MARK L. ROBERTS, Chatsworth, Ill.—*Rotary Knitting Machine.*—May 7, 1867.—The needle cylinder may revolve either way on a horizontal axis. A double cam serves when reversing to shift the link into either set of grooves, to operate the presser properly. The adjustment of the needle operator on the bar is effected by a worm, and the rack governs the length of throw of the needles as tight or loose work may be required. The same adjustment governs accordingly the amount of thread to be let off.

Claim.—First, actuating the needle operator through the bar W, to which it is attached, the bar being supported in suitable bearings and receiving its movement through the medium of a vertical slotted arm V, and a pin or stud U of the revolving wheel or disk T, or its equivalent, when the whole are arranged together substantially as and for the purpose described.

Second, the needle operator T, notched or toothed carrying bar W, and screw nuts A², when all are combined together substantially as and for the purpose described.

Third, the combination of the thread puller A³ with the looped upright Z, of the needle actuator Y, the whole operating substantially as described.

Fourth, the double cam way or groove H², for operating the yarn presser when connected with the same, substantially in the manner and for the purpose described.

64,573.—THOMAS ROBJOHN, New York, N. Y., assignor to the AMERICAN NEEDLE LOOM COMPANY.—*Loom.*—May 7, 1867.—The filling is carried through the shed by a reciprocating eye-pointed needle, and the loop of the warp locked at the selvage by the passage through it of a shuttle and its thread. The weft retractor swings freely on a pin; its shorter arm when thrown fully back by a projection rests in a notch on the needle guide, until the pull of the needle passing through the shed detaches it and draws the retractor forward, taking up yarn from the bobbin. The claim cites the other peculiarities.

Claim.—First, in combination with a needle for carrying the weft thread through the warp in a loom, a shuttle so applied and actuated as to operate in an arc of a circle parallel to the plane of the warp that in approaching to enter the loop of the weft yarn it moves nearly parallel with and close to the selvage of the web being woven, and afterwards gradually moves away from the warp so that in completing its movement at the same time as the needle completes its returning movement it pulls its yarn or thread tight in a direction transverse to the warp, substantially as and for the purpose herein specified.

Second, the weft retractor Z, applied to operate on the weft, substantially as and for the purpose herein described.

Third, the arrangement of the upright shaft M, and its crank and eccentric in relation with the warp whereby they work the needle holder and shuttle carrier at opposite sides of the warp by direct rod connections, substantially as herein specified.

64,574.—CHARLES F. RODRICK, Lynn, Mass.—*Car Coupling.*—May 7, 1867.—The upper and lower

spring hooks are presented in opposite directions, and shut coincidentally over the pin, one intervening between its counterpart fellows.

Claim.—In combination with the draw bar of a railway carriage, the spring latch bars pivoted to the draw bar, as described, and recessed at their outer ends in such manner that when they are brought together the tongue of the one shall fit in the grooves of the other, substantially as shown and set forth.

64,575.—ALEXANDER ROSS, Maine, N. Y., assignor to himself and JOHN FELL, New York, N. Y.—*Machine for Washing Hides.*—May 7, 1867.—The hollow cylinder is divided into a series of compartments for the reception of the hides. The cylinder is charged with a washing liquid.

Claim.—The wheel A for washing hides, closed at both ends, and having its sides open at various points, its interior divided into compartments B by close partitions C, having ribs D extending in the direction of their length, the said wheel provided with hollow journals through which the washing liquid is introduced, when all are constructed and arranged to operate substantially as herein shown and described.

64,576.—JOHN E. ROWLAND, Hagerstown, Md.—*Cultivator.*—May 7, 1867.—The main frame is supported on the wheels. The beams are V-shaped to brace the plough shanks, and are attached at their forward ends by double staples. The double-action stirrup lever adjusts the middle beams, and side levers adjust the side beams.

Claim.—The above-described cultivator, the beams C, levers N, and stirrup lever M, being all arranged and combined substantially in the manner and for the purposes set forth.

64,577.—B. S. SACKETT, Monroe, Wis.—*Machine for Forming Boilers.*—May 7, 1867.—The end of the metallic plate is attached to the catch on the "former," which has a groove around it to receive the wired edge; the plate is bent around till the edges join at the catch, where it is secured and soldered.

Claim.—First, the former A, when made substantially as herein shown and described and for the purpose set forth.

Second, the grooved and notched board, plank, or bench B, when made substantially as herein shown and described, in combination with the former A, as and for the purpose set forth.

Third, the combination of the clamps C with the former A, substantially as herein described and for the purpose set forth.

64,578.—MARK SAFFORD, Boston, Mass.—*Lamp Extinguisher.*—May 7, 1867.—The extinguisher is actuated by a cam applied to the wick-elevator shaft. The retrograde motion of the shaft in lowering the wick also attaches the extinguisher, which is removed by rotation of the shaft in projecting the wick for lighting.

Claim.—So applying the extinguisher to the burner that its movements shall be actuated by the wick-elevating shaft, and by the same act which raises and lowers the wick, substantially in the manner and for the purpose as described.

Also, the device for causing the above-described movement of the extinguisher, consisting of the finger *h* and cam *i* applied to the shafts *g* and *d*, the extinguisher being moved in one direction by the spring *j*, the whole being arranged and operating together in manner as above set forth and explained.

64,579.—ELNATHAN SAMPSON, Lansingburgh, N. Y., assignor to himself and EDWARD CHAMBERLIN, same place.—*Car Wheel.*—May 7, 1867.—The beveled part of the tread is run upon the outer rail of a curve by the centrifugal force, and its greater circumference enables it to traverse the necessarily longer side of the track without slipping.

Claim.—A railroad car wheel having the conical tread surface *c*, cast with the flat tread surface *d*, and with the guiding flange *f*, in the manner and for the purposes substantially as herein described and set forth.

64,580.—J. DAVID SHEETZ, Robeson, Pa., and REUBEN ADAMS, same place, assignors to themselves

and JOHN MCKNIGHT.—*Cultivator.*—May 7, 1867.—The coil spring teeth are attached to spring jointed standards, enabling them, after giving way to obstructions, to recover position. The standards connected by a pitman, crank, and cog wheel with the driving wheel. Levers, connected by bars with the thills and pivoted in front to the frame, regulate the depression and are secured by wedges in the eccentric rack bars.

Claim.—First, the arrangement of the frame A with its shafts G, arms I I, bars *b b*, and springs *a a*, with rakes *d*, when operated in the manner and for the purpose set forth.

Second, the elevation or depression of the frame with its cultivators by means of the bar *g* and levers *y* attached to the thill *e*, in the manner substantially as and for the purposes specified.

64,581.—JOHN G. SCHMIDT, Rochester, N. Y.—*Machine for Cutting Bung.*—May 7, 1867.—Improvement on his patent, December 11, 1866.—The steel safety plates are fitted to the outside edge of the circular plate and secured with screws. The steel gauge has a square frame to admit and guide the knife. An adjusting screw passing through the guide plate regulates the size of the bung.

Claim.—First, the safety plates *o o*, in connection with gauge *k*, screw *p*, and nuts *e e*, all for the purpose and in the manner herein described.

Second, the head *q* of a yielding centre *b*, with hole *m*, the holes *m m m* in mandrel *a*, and the pin *n*, all for the purpose and in the manner herein described.

64,582.—LOUIS SCHREIBER, New York, N. Y.—*Cornet, &c.*—May 7, 1867.—The water valve, of cylindrical form, is at the bottom of a down bend, between the mouth piece and tone valves. From these valves the main tube is in form of a circle, and extending backward the mouth piece is turned upward. The segmental rubber stops on the water-valve cylinder coming in contact with a pin to prevent over-rotation.

Claim.—The form given to the instrument, as herein described, by means of which the sound is discharged from the bell in an upward direction, while the weight of the instrument can rest on the shoulder of the performer, while the part to be held by the left hand and the keys are in front in position which will enable the performer to have an easy control thereof, as described.

Also, the rotating water valve and its case, in combination with and located at the lower part of the curved pipe between the mouth-piece tube and the tone-valve tube, as and for the purpose described.

Also, the india-rubber segment stops attached to the inner face of the cap plate of valve cases, in combination with the rotating valves, as and for the purpose described.

64,583.—CHARLES H. SCHUBEUS, Newark, N. J., assignor to SAMUEL LAGOWITZ and ISADORE LEHMAN, same place.—*Machine for Cutting Sheet Metal.*—May 7, 1867.—For cutting mouth frames for satchels, &c. The dies are formed in three sections, the middle one of which is removable to admit a shorter or longer section to be placed in, to vary the length. The edge of the lower cutter is convex so as to commence the cut at the center.

Claim.—The arrangement of the parts *a a' b*, formed as shown and secured to the tool holder C, in combination with the knife D, constructed and operating substantially as and for the purpose described.

64,584.—CHARLES H. SCHUBEUS, Newark, N. J., assignor to SAMUEL LAGOWITZ and ISADORE LEHMAN, same place.—*Metal Bending Press.*—May 7, 1867.—The follower has two guides working in the base plate and two in the yoke; it is also guided by ribs on the vertical legs of the yoke.

Claim.—The additional guide rods H, in combination with the guides D D in the yoke E, and with the base plate F, screw C, guides G G, and cross-head B of a press A, constructed and operating substantially as and for the purpose described.

64,585.—CHARLES H. SCHUBEUS, Newark, N. J., assignor to SAMUEL LAGOWITZ and ISADORE LEHMAN, same place.—*Bending Metal.*—May 7, 1867.—The

angle plates are clamped on the middle die by their flanges, which enter the grooves between the middle and side pieces; this convex die is forced down into the concave die, the flange entering the groove around the die.

Claim.—The punch A, composed of the side pieces or jaws *a c* and center pieces *b*, in combination with the die B, constructed and operating substantially as and for the purpose set forth.

64,586.—JUDSON SCHULTZ, Ellenville, N. Y.—*Dry House.*—May 7, 1867.—Explained by the claim and illustration.

Claim.—The arrangement in the dry house of the vertical partitions C, having slats F secured to their sides extending from the second floor D through the roof E, their upper ends forming chimneys M, having dampers N, the lower ends provided with the heat-regulating doors L and their front sides with doors K, opening upon the floors D G H, &c., extending across one side of the dry house, their inner ends meeting the inner edges of the partition C, substantially as herein set forth and for the purpose specified.

64,587.—GEORGE V. SHEFFIELD and JAMES F. COBURN, Hopkinton, Mass.—*Preparing Leather for Wear.*—May 7, 1867.—The wearing surface of the leather is filled with metallic pins of uniform diameter, which cut off flush with the surface of the leather.

Claim.—The improvement in preparing leather for wear, substantially as set forth.

64,588.—F. R. SMITH, Bennington, Vt.—*Blind Slot Fastening.*—May 7, 1867.—The slats are kept in any desired position by a cam in connection with the lower end of the vertical rod.

Claim.—The cam D, applied to the blind frame to serve as a fastening for the slats, substantially as herein shown and described.

64,589.—ROBERT SPONOUSE, Jersey Shore, Pa.—*Manufacture of Water-proof Leather.*—May 7, 1867.—Dry hides are three-fourths tanned in sweet liquor, one week in sour liquor, with daily handling; stuffed with tanners' oil, 4; flaxseed oil, 1; and tallow, 2 parts. After soaking they are placed in the vat, flesh side down, and left in the tan six weeks; treated while half dried with tanners' oil, 1 lb.; beeswax, 3 oz.; and castor oil, 4 oz.; blacked with lampblack; beef gaud and oil resulting from burning caoutchouc is applied.

Claim.—The composition specified in the process of tanning the leather and its application and use in the manufactured articles, substantially in the manner and for the purpose as herein described.

64,590.—LUMAN SQUIRE, Norwalk, Ohio.—*Thill Coupling.*—May 7, 1867.—The coupling bolt is kept in position by the two hooks of the spring, which is sufficiently elastic to be removable by hand to permit the withdrawal of the bolt.

Claim.—The spring arms *e e'*, in combination with the bolt E, provided with the shoulders *l*, semi-elliptic in its transverse section, when constructed and arranged as set forth.

64,591.—A. F. STAYMAN, Baltimore, Md.—*Preparing Smoking Tobacco.*—May 7, 1867.—Improvement on his patent, January 15, 1867. The tobacco is comminuted and then mixed with some mucilaginous liquid and passed through screens.

Claim.—First, the process herein described of preparing tobacco for smoking.

Second, as a new article of manufacture, the smoking material herein described, whether composed of tobacco proper, or partially of tobacco and partially of tobacco dust combined, when prepared substantially as set forth.

64,592.—H. STEVENS, Mount Vernon, Ohio.—*Double Shovel Plow.*—May 7, 1867.—The shovel stocks are attached to a horizontal brace, which is connected by supports with the handles.

Claim.—The combination of the shovel stocks B B with the horizontal brace C and the beam A, when the same are constructed in the form and manner for the purpose specified.

64,593.—G. SYMMES and T. W. HAYES, Brooklyn, N. Y.—*Steam Generator.*—May 7, 1867; antedated

April 26, 1867.—The fire box contains a series of inverted conical water vessels connected by pipes through the crown sheet to the steam and water space above, and through the side of the generator to the lower part of the annular water space.

Claim.—First, the arrangement within the fire box or chamber of one or more series of inverted cones forming steam generators and communicating with the body of the boiler, substantially as specified.

Second, the arrangement of generators in the fire box or chamber separately connected with the water space above or body of the boiler by pipes passing through the crown sheet of said chamber, and with the lower portion of the water jacket surrounding said fire box by pipes running through the jacket and down or around the outside thereof, essentially as shown and described.

64,594.—JOSEPH TATTERSALL, Indianapolis, Ind.—*Compound for Making Artificial Stone and for Coating Stone and Bricks, &c.*—May 7, 1867.—Used as stone or cement. River sand, 45; litharge, 1; bone ashes, 1; air-slaked lime, 1 part; mixed with linseed oil to proper consistence. For a finer material, white lead mixed with caoutchouc and pulverized earthenware may be added.

Claim.—The compound herein described, together with such variations as may be produced by varying the proportions of the ingredients named, substantially as and for the purposes set forth and described.

64,595.—GEORGE TEFFT, Salem, N. Y.—*Locomotive and other Wheels.*—May 7, 1867.—Wedge-shaped segments within suitable depressions of the rim are moved beneath the tire by transverse wedges to tighten said tire.

Claim.—The employment of the wedges C C C C, in combination with the keys D D D D, or their equivalents, operating in the manner and for the purposes substantially as herein fully described and set forth.

64,596.—ELLIS THAYER, Worcester, Mass.—*Paint and Varnish Brush.*—May 7, 1867.—An elastic packing ring is inserted between the bristles and the encircling ferrule.

Claim.—First, the combination with the brush handle, bristles, and ferrule for holding the same upon the handle of an elastic packing, interposed between the ferrule and bristles, substantially as and for the purposes set forth.

Second, in a brush as herein described, the combination with the bristles and ferrule of an interposed tube of rubber or other elastic material, extending down upon the bristles below the ferrule, as and for the purposes herein specified.

64,597.—JOHN H. THOMAS, Philadelphia, Pa.—*Window Frame.*—May 7, 1867.—The side pieces have corresponding semi-cylindrical cavities for the balance ropes and weights to work in, and are secured together by dowels.

Claim.—A side piece for a window frame, consisting of two sections or strips *a a'*, grooved and connected together, substantially as set forth for the purpose specified.

64,598.—CYRUS TUCKER, Bloomington, Ill.—*Alarm Lock for Tills.*—May 7, 1867.—The vertical divisions project upward, dividing it into a series of spaces of equal width, in which the pivoted tumblers work. The frame has a flange at each end, by which it is secured with screws to the back end of the drawer. The pivoted lever, which reaches forward alongside the drawer, connects with and detaches the tumblers.

Claim.—First, the series of tumblers *a*, having one end heavier than the other, and so pivoted as to cause them to tip, in combination with a supporting head H, arranged to hold them in a horizontal position, substantially as shown and described.

Second, the combination of the pivoted tumblers *a*, constructed as described, with the supports *u* and levers E, arranged for joint operation as herein described.

64,599.—J. S. VAN BUREN, South Troy, N. Y.—*Heating Stove.*—May 7, 1867.—The fire pot is situated between two air chambers, which receive radiated

heat therefrom, and they are further surrounded by flues, which conduct the calorific current to the chimney.

Claim.—First, the arrangement of the hot air chambers E' A' and J, in combination with the fire box B.

Second, the flue D surrounding the fire box, substantially as shown and described.

Third, the jacket C, constructed substantially as described, in combination with the furnace A and the flue D.

64,600.—JOSEPH B. VAN DEUSEN, New York, N. Y.—*Rotary Steam Engine.*—May 7, 1867.—The ends of the cylindrical part of the piston enter recesses in the case beyond that part of the chamber traversed by the reciprocating piston plate. The chamber is elliptical, its shorter diametric line striking between the parts.

Claim.—First, the revolving cylinder A, constructed so that its ends rotate within recesses in the side plates of the stationary chamber F, substantially as shown and described for the purposes specified.

Second, the arrangement of the ingress and egress ports in relation to the permanent abutment, and to the revolving cylinder, fitted with a single sliding piston for operation, substantially as set forth.

64,601.—PHILIP VERBECK, Nenah, Wis.—*Window Fastening.*—May 7, 1867.—Explained by the claim and illustration.

Claim.—The button C, pivoted to the sash, and having the two eccentric arms *c* and radial thumb piece *d*, constructed and operating in such a manner that when the point of contact of the arm *c'* with the jamb of the window frame is below the pivot *b*, the sash is held raised, and when the point of contact of the arm *c* is above said pivot, the sash is held down, as shown and described.

64,602.—WILLIAM VERMILYA, Dayton, Ohio.—*Composition for Invigorating Fruit and Forest Trees.*—May 7, 1867.—Sulphate of copper, 3 lbs.; sulphur, 1 lb.; saltpeter, 1 oz.; pulverized and mixed with iron filings, $\frac{1}{2}$ lb.; plugged in an auger hole near the root.

Claim.—The composition of matter formed by the mixture of the proportions of three pounds of sulphate of copper, one pound of sulphur, one ounce of saltpeter, and a half pound of iron filings, to be used as a tree invigorator and destroyer of vermin, which may be in and upon fruit and forest trees, as herein described.

64,603.—J. W. WALTERS, Tiffin, Ohio.—*Flour Bolt.*—May 7, 1867.—The hammers are hinged to the beam and firmly connected to longitudinal spring strips whose inner ends are attached to the radial arms; their outer ends are held back by the segment which is adjusted to cause a more or less considerable recoil blow on the slat.

Claim.—First, constructing the rod that actuates the hammer for a bolting reel, with a spring capacity in itself, for the purposes described and substantially as set forth.

Second, the combination of the stepped segment E, and the spring rod D, that actuates the hammer, with a four-bolting reel, substantially as described.

Third, the pivoted segment E, when constructed with steps *g*, upon its point of contact with the spring rod D, and made adjustable for the purpose described.

Fourth, the arrangement of the segment E, with its stepped ribs in the top of the bolting reel case, substantially in the manner and for the purpose described.

64,604.—CHRISTIAN WEITMAN, Hazelton, Iowa.—*Horse Shoe.*—May 7, 1867.—The heel calks are formed with eyes to fit over the rear ends of the shoe; the ends have notches made in their upper surfaces into which the eyes of the calks drop; they are fastened by a key.

Claim.—The securing of the heel calks to a horse shoe, in the manner substantially as herein shown and described.

64,605.—SETH WHEELER, Albany, N. Y.—*Permutation Lock.*—May 7, 1867.—The central shaft is connected to one of the permutation wheels and the sleeve prolongation of the dial to the other one. The

permutation wheels are adjustably connected to the tumblers, whose proper position allows the horizontal retraction of the bolt. For unlocking, a cylindrical key is placed over the dial and has a projection engaging studs on the dial plate and dial, and the index finger of the central shaft, rotating them into proper position.

Claim.—First, the permutation wheel in combination with a circular tumbler, an indicating dial, a sleeve, and a tooth or space for connecting the tumbler and dial, constructed and arranged substantially as and for the purposes specified.

Second, a movable stud or tooth, in combination with the dial or tumbler as specified, whereby the tumbler can be placed in a greater number of positions relatively to the dial than there are teeth in the gear, as set forth.

Third, in combination with a series of tumblers, as set forth, a key formed of a series of changeable or adjustable rings acting on studs or projections, as specified.

64,606.—N. H. WHISEMANN, Independence, Iowa.—*Sorghum Evaporator.*—May 7, 1867.—The vat is divided longitudinally by an upright partition, and the larger section is divided transversely, the compartments communicating by passages made alternately in opposite ends of the partitions. An end compartment in which the sirup is cooled has communication when desired with the rear end of the lower section, and the two main sections are connected together at their fore ends. The smaller side section is covered by an inclined strainer dripping outside, on which the scum is thrown.

Claim.—The arrangement of the sectional compartments *a*, openings *C'*, compartments *C*, and gates *E F*, in combination with the section *B* and strainer *G*, operating conjointly as and for the purposes set forth.

64,607.—JOHN S. WHITE, Boston, Mass.—*Paint Brush.*—May 7, 1867.—The metallic cap tube for securing the bristles is divided into sections for removal as the bristles wear.

Claim.—The improved paint brush, metallic cap tube *B*, made in sectional parts, united and readily separable, as and for the purpose as hereinbefore described.

64,608.—JOHN W. WILCOX, New York, N. Y.—*Slide for Fastening Envelopes, Pocket Books, &c.*—May 7, 1867.—The band passes through the slots of the plate which is attached to the envelope by clinches formed in making the slots.

Claim.—Constructing a metal slide *a*, with spurs or projections *d d*, at the ends of the slots *c c*, for securing envelopes, portmonnaies, or other similar articles, formed and attached in the manner substantially as herein described.

64,609.—A. A. WILDER, Detroit, Mich.—*Planing Machine.*—May 7, 1867; antedated March 5, 1867.—The board is passed edge up between cutters which plane the face, groove its two edges, and form beading and tongues at its center; the edges of the tongues are rounded so deeply as to divide the board longitudinally.

Claim.—First, the combining and arranging of cutters in a planing machine, in the manner substantially as shown and described, whereby lumber is prepared for flooring or ceiling by tonguing, grooving, and planing the same at one operation, and making two or more finished pieces of lumber out of one without the use of a saw.

Second, the self-adjusting feed-level wheels *E* and *E'*, when constructed and operating in the manner substantially as shown and described, and for the purpose set forth.

Third, the combination of the shield *r*, spring *s*, and roller *q*, constructed and operated in the manner substantially as shown and described, and for the purpose set forth.

64,610.—E. P. WILLETS, North Hempstead, N. Y., assignor to EDWARD RICHMOND.—*Rack for Whips.*—May 7, 1867.—The orifices in the wooden plates or stands have perforated rubber disks for holding whips, umbrellas, &c.

Claim.—First, a rack for holding and suspending whips and other articles, consisting of one or more plates of wood or of other suitable material, in which a series of orifices or perforations is formed, combined with a corresponding perforated sheet of rubber or other elastic substance, and for the purposes herein set forth.

Second, in a rack for suspending whips and other articles, as described, the combination with the perforated plates of wood or other suitable material, of a perforated sheet of vulcanized rubber or other elastic substance, interposed between the said plates under the arrangement herein specified, so that the whip or other article, when inserted in the orifice formed in the plate, shall be held by the elastic substance, substantially as set forth.

64,611.—JAMES A. WILLIS, Cherry Valley, N. Y.—*Medical Compound.*—May 7, 1867.—For cure of ring bone, &c. Mercury, 4 oz.; nitric acid, 2 oz.; caustic, 2 drachms; sulphuric acid, 2 oz. To be kept in a stoneware pot partly immersed in cold water to act as a condenser.

Claim.—The medical compounds, substantially as and for the purposes described.

64,612.—JOHN A. WILSON, Spencer, Mass.—*Mop Head.*—May 7, 1867.—The mop cloth is attached to an endless apron passing between pressing rolls.

Claim.—Securing the mop head H to the endless apron F, which passes around the upper roller E and lower roller G in the mop head A, as herein set forth for the purpose specified.

64,613.—THOMAS H. WINDLE, Westchester, Pa.—*Metal Socket Ferrule.*—The tines are braced by two lips with longitudinal bearings.

Claim.—In a cast metal socket ferrule for removable forks, drags, &c., the two lips a^2 and a^3 , with the upper and the lower separate longitudinal bearings, a^2 and a^3 , each of the latter being of the same width as the shank of the fork or drag, as set forth, for the purpose of supporting the fork, and allowing its shank to be loosened with greater facility and safety in case of its becoming rusted fast, as described.

64,614.—C. WISE and B. LOEFFLER, New York, N. Y.—*Beer and Mash Cooler.*—May 7, 1867.—The rotary vertical shaft has its fans and stirrers; the former cause a circulation of air, and the latter stir the contents of the shallow circular tub.

Claim.—A cooler for mash beer and other liquids, consisting of a circular stationary pan B, in combination with a revolving shaft D, to which the fan or fans K and stirrers H are adjustably secured, substantially as and for the purpose herein shown and described.

64,615.—DAVID WOLF, Lebanon, Pa.—*Harvester.*—May 7, 1867.—The jointed and hinged main platform is adapted for dumping, and when the segmental rear extension is attached, it is adapted for raking.

Claim.—The flanged extension part L, in combination with the hinged jointed platform H, substantially as and for the purposes described.

64,616.—GURDON G. WOLFE, Troy, N. Y.—*Wood Burning Stove.*—May 7, 1867.—The caloric currents pass from the fire chamber down forward pipes to the hollow base, then up backward pipes to the hollow top and chimney.

Claim.—First, the employment of the chamber H, divided by means of the partition K, containing the movable damper C, in combination with the rear or back column flues B, by means of which the direct and circuitous draft is had, in the manner substantially as herein described and set forth.

Second, the broad bottom flue D, in combination with the front column flues A, and with the rear or back column flues B, each being arranged in the manner substantially as herein described and set forth.

64,617.—M. S. RIDGWAY, Danville, and CHRISTOPHER LEWIS, Harrisburg, Pa.—*Heating and Puddling Furnace.*—May 7, 1867.—The water jacket is open above, giving free exit to steam, and the separate sections are connected by tubular bolts, allowing passage of water. The bridges contain water, and have ascending and descending steam and water pipes.

Claim.—First, the double-furnace plates for containing a body of water to preserve them and moderate the external heat, preventing the wear of bricks and the breaking of the plates by expansion or contraction, substantially as and for the purpose described.

Second, the stack, constructed, in whole or in part, of water plates, substantially as and for the purpose described.

Third, the door at the base of the stack for the purpose of allowing the heater or puddler to take out the cinder and other refuse, instead of destroying the brick, as is now the case, substantially as described.

Fourth, the water plates in the stock-hole frames, working door frames, and fire plate, either or all, substantially as and for the purpose set forth.

64,618.—WM. ALEXANDER, Union Valley, N. Y.—*Churn.*—May 14, 1867.—The dasher blades are placed in alternate rows through the supporting head attached to the shaft, which is vertically reciprocated by the operating lever.

Claim.—The dasher D E, constructed substantially in the manner herein shown and described and for the purpose set forth.

64,619.—DARWIN ALMY, Tiverton Four Corners, R. I.—*Plow.*—May 14, 1867.—The wheel has its bearings in links suspended from the beam, and is adjusted by a lever connected by a rod to the middle joint of the links.

Claim.—The arrangement of the lever D, the rod b, and the links c' and g, connected with the guide wheel E, for regulating the depth of the furrow of a plow, operating as herein described.

64,620.—CHARLES W. ATKESON, St. Louis, Mo.—*Well Boring and Drilling Machine.*—May 14, 1867.—The drill is fed to its work by unwinding it from the shaft without interfering with the action of the walking beam.

Claim.—The attachment of the chain drum J, gearing K L, and wheel M, to the walking beam, substantially as herein described and for the purpose specified.

64,621.—E. P. BANKS, Portland, Me.—*Cattle Tie.*—May 14, 1867.—The bow is pivoted at one end to the clamp, and at the other end passes over a projection. The swivel bolt has a hole for the attachment of the rope.

Claim.—First, the combination of the bolt d, clamp a, and bow b, when constructed as set forth in Fig. 1, for the purposes specified.

Second, the combination of the bolt d, clamp a, and bow b, when constructed as set forth in Fig. 3, and for the purposes specified.

64,622.—CHARLES BERCKHEMER, Cincinnati, Ohio.—*Vessel for Malting and Brewing.*—May 14, 1867.—Explained by the claim.

Claim.—A perforated bottom or other metallic portion of a brewer's or maltster's vessel, composed of cast or wrought iron electroplated, as set forth.

64,623.—REINHOLD BOEKLEN, Brooklyn, N. Y.—*Blotting Pad.*—May 14, 1867; antedated May 3, 1867.—The board is hollowed out above to increase its flexibility, and the blotter is secured by slides working on an inclined plane.

Claim.—First, the employment or use of a flexible board or bottom to the blotter, operated and for the purpose substantially as herein described.

Second, the employment of the slides D D, combined with the wedge-shaped ends of the blotter board A, operated and for the purpose substantially as herein shown.

64,624.—REINHOLD BOEKLEN, Brooklyn, N. Y.—*Paper File.*—May 14, 1867.—The spring hook closes on the usual stationary file hook; any invoice can be obtained by raising those above it on to the spring hook and removing the paper at the aperture made by the disconnection of the two hooks.

Claim.—First, the employment of one or more slides I, or flaps K, in combination with the file hooks, operated as and for the purpose substantially as herein shown.

Second, the construction and arrangement of the spring plates B, and its guide F, in combination with the back board A, operated in the manner and for the purposes substantially as herein described.

64,625.—BENJAMIN BOORMAN, Waukesha, Wis., assignor to himself and ISAAC LANE, same place.—*Flour Bolt.*—May 14, 1867.—The bars and strips are attached so as to fasten the bolting cloth on their inner surfaces to avoid the back flour held by internal projections.

Claim.—The strips *a*, of the bolting cloth E, secured to the parallel arms D of the revolving flour bolt A, by means of the strips *b*, in such a manner that the said strips *a* shall be flush with the inner surface of said slats D, as herein set forth, for the purpose specified.

64,626.—JAMES BRENNAN, New Haven, Conn.—*Carriage Shackle.*—May 14, 1867.—The bolt of the thill iron is clasped between two plates with corresponding semicircular recesses. The clamping screw is secured from turning by a strap through its eye.

Claim.—The combination of the two parts C D, hinged together at the rear, and secured at the front by a screw E, as and for the purpose specified.

64,627.—THOMAS and GEORGE B. BURDETT, Dansville, N. Y.—*Potato Digger.*—May 14, 1867.—The handle slides through holes in the cross-bar and axle, a stay bolt preventing its protruding too far. The axle serves as a fulcrum in raising the hill of tubers.

Claim.—The arrangement of the fork D, with the axle A, bar C² of the frame C, and wheels B, when all are constructed and operating as herein set forth.

64,628.—DAVID CARROLL, Union, Pa.—*Stump Extractor.*—May 14, 1867.—The frame is supported on shoes which act as runners for transportation. The chain winds over a drum on the sweep shaft and the portions approaching toward and receding from the drum run upon sprocket wheels which are geared together and run in different directions.

Claim.—First, the pulleys EG and I, in combination with the chains M and N, substantially as shown and described and for the purposes set forth.

Second, the castors and shoes, R R R, in combination with the derrick, substantially as shown and for the purposes set forth.

64,629.—J. E. CARVER, Bridgewater, Mass.—*Cotton Picker.*—May 14, 1867.—The tongue is armed with reflex spines, and directly above it in the box is an elastic plate similarly armed, which holds the fiber drawn into the box by the reciprocating action of the tongue.

Claim.—The reciprocating tongue B, one or more, placed within a box A, and armed with reflex spines or teeth, and used either with or without the toothed plate E, substantially as and for the purpose set forth.

64,630.—F. A. L. CASSIDY, Newnansville, Fla.—*Cotton Press.*—May 14, 1867.—A cylinder receives the binding hoops; the cotton is forced into the cylinder at successive charges, the ends of the hoops attached and the cotton forced out into the bag which is connected to the cylinder and hangs in a recess below it.

Claim.—First, the suspended slotted packing case or cylinder B, or equivalent, in combination with the frame A, substantially as herein shown and described.

Second, the combination of the ratchet bar D, spring E, and rods C, with the packing case B, substantially as herein shown and described.

Third, the combination of the piston head I, with the packing case B, and rods C, substantially as herein shown and described.

Fourth, the construction and arrangement of the bottom F, hinge G, and catch H, on the lower end of the packing cylinder B, as herein set forth.

64,631.—THOMAS G. CLIFFORD, Derby, Conn.—*Wagon Wheel Lock.*—May 14, 1867.—The inner ends of the hubs have plates with holes to receive the ends of bolts beneath the axles. The bolts are projected by spiral springs on the loosening of cords attached to their inner ends.

Claim.—The arrangements of the bolts I, in com-

bination with the plates F, and the shaft G, with its ratchet *h*, constructed and arranged to operate substantially in the manner herein set forth.

64,632.—GEORGE G. COCHRAN, Brooklyn, N. Y.—*Bedstead.*—May 14, 1867.—The posts are secured together by tension rods which have right and left screws worked by a sleeve nut which connects their ends.

Claim.—The rods, D D', at each side of the bedstead, provided at their inner ends with right and left screw threads, connected by nuts E, and attached to their outer ends to the posts A, by the hooks and eyes *c d*, and the knobs *e*, and hooks *f*, in combination with the tenons *b*, on the ends of the rails *c*, and the mortises *a*, in the posts A, substantially as and for the purpose set forth.

64,633.—FREDERICK COHLMIEER, Keek's Centre, N. Y.—*Sleigh Brake.*—May 14, 1867.—The slot in the draught bar slips back on the attachment bolt when the sleigh crowds the team, and the draught bar forces back the upper section of a double action lever to which it is attached which projects the dog on the lower end into the track.

Claim.—First, an improved sleigh brake formed by the combination of the draught bars F, supporting bar G, bent levers H, and dogs I, with each other, and with the frame and tongue of the sleigh, substantially as herein shown and described and for the purpose set forth.

Second, the combination of the bar M, and levers N, with the draught bars F, and with the frame of the sleigh, substantially as herein shown and described and for the purpose set forth.

64,634.—D. L. COLUMBIA, R. V. STOCKING and C. W. WOODRUFF, Morrison, Ill.—*Spring for Vehicles.*—May 14, 1867.—Bent levers are pivoted to the axles at one end and to an arm pendent from the body in the mid-length; they are formed into a hook at the other end to receive the bight of the rubber loops which are attached to the body.

Claim.—First, suspending the bodies of vehicles upon bands of India-rubber, so applied that the action of the load shall take effect in the elongation of the springs, and it be raised by their contraction, substantially as described.

Second, the combination of the India-rubber bands H, standard D, and oscillating lever E, substantially as and for the purpose set forth.

64,635.—GEORGE B. F. COOPER, New Albany, Ind.—*Lock for Car Doors, &c.*—May 14, 1867.—The sliding bolt which prevents the retraction of the spring bolt is locked by a pawl, but retracted by a key.

Claim.—The catch bolt D, in combination with the sliding bolt B, operated by the thumb pawl *c*, to lock or secure the fastening without employing a key, arranged substantially as herein described.

64,636.—JOHN H. CRANE, Charlestown, Mass.—*Transporting Cars through Tunnels.*—May 14, 1867.—Sub-trucks constructed in jointed sections have tracks to receive the cars of a train and traverse the tunnel with their load; the upper tracks connect with the main car tracks at either end, and a hinged platform is let down to make the close rail connection.

Claim.—The method of transporting cars through tunnels by means of traversing cars having rails upon their platforms, which rails connect with the railway tracks at the opposite ends of the tunnel, substantially as set forth.

Also, making the cars *c* sectional and jointed, substantially as described.

Also, the hinged or swinging rail platform *h*, made to swing up from, or to be swung over upon the cars, substantially as described.

64,637.—HORACE CROFOOT, Oak Park, Ill., assignor to himself and T. W. V. P. MERCEREAU.—*Pressing Brick.*—May 14, 1867.—The mold plates are fixed and have flaring mouths. The upper and under plungers are operated by cams. The clay is carried to the mold by boxes sliding from the hopper to said mold and serving to force aside the previously pressed bricks which have been raised from the molds by the lower plungers.

Claim.—First, the fixed mold plate J and reciprocating plungers F I, when arranged to operate as shown, or in an equivalent manner, so that the clay, after being subjected to one pressure in the molds *f*, will be raised therein to their wider parts, and subjected to a gradual pressure by both sets of plungers, in order to expel the atmospheric air from the clay, substantially as described.

Second, providing the upper plunger F with convex faces *d*, when said plungers, thus constructed, are used in connection with molds *f*, having inclined sides, and also used with a set of lower plungers I, to raise the clay in the molds, after being subjected to one pressure, substantially as and for the purpose set forth.

64,638.—FRANCIS CRUIKSHANK, Edinburgh, Scotland.—*Coating for Iron Ships and other Structures.*—May 14, 1867.—Red oxide of mercury and white precipitate of mercury are added to rosin and rubber previously dissolved by the aid of heat in naphtha; pigment is added, if desired.

Claim.—The preparing of an improved anti-folding coating, with the mercurial compounds hereinbefore specified, and substantially in the manner hereinbefore described.

64,639.—FELIX MANUEL DAUNOY, New Orleans, La.—*Guard for Railway Cars.*—May 14, 1867.—The cylinder of caoutchouc is fastened perpendicularly before each wheel to fend off obstacles from the wheels.

Claim.—The application of a gum rubber drum in front of every wheel of a horse or steam car, as herein described.

64,640.—J. Q. A. DE HUFF, Summitville, Iowa.—*Car Truck.*—May 14, 1867.—The outer boxes are pivoted so as to turn in a horizontal plane, and the inner journals slide in segmental grooves to allow accommodation to curves. Spiral springs each side of the inner boxes tend to keep the axles in a transverse direction. Racks on these boxes engage segmental gear plates pivoted in the frame to keep the wheels of a given pair to the same angle.

Claim.—The arrangement of the double-clogged segments *e* hung in the cross-frame F, between the curved guides E, combined with the springs *d*, slot *c*, racks *g*, the boxes *b*, and the axle C, arranged and operating substantially as and for the purpose described.

64,641.—FREDERICK DICKINSON, Geneva, Ohio.—*Field Fence.*—May 14, 1867.—The rails enter notches in the stakes, which enter the ground or a block, and are bound together at the top, forming a zigzag fence.

Claim.—The special construction and arrangement of a fence for the purpose and in the manner set forth.

64,642.—JOHN V. DIXMORE, Milford, Mass., assignor to himself and MOSES HARRIS, same place.—*Car Wheel.*—May 14, 1867.—The tire is enclosed between flanges, and backed by elastic packing; it is so connected to the outer flange as to prevent independent rotation.

Claim.—The arrangement of the elastic packing or ring B, the inelastic tire C, the body A, the end supporters D E, and devices substantially as described, or their equivalents, for preventing the tire from slipping around on the elastic ring, and enabling such tire to vibrate and play in radial directions, as specified.

64,643.—Cancelled.

64,644.—D. DODGE, Rockford, Ill.—*Uterine Supporter.*—May 14, 1867.—The plate is secured in front of the abdomen, its lower edge supported by the os pubis. The bent tube which traverses the vagina and supports the pad is adjustable, and turns freely in a sleeve which is hinged to the plate.

Claim.—The sleeves D and C jointed to the pad, in combination with the tube B and springs H I, substantially as and for the purpose set forth.

64,645.—JAMES DOUGHERTY, Philadelphia, Pa.—*Cupola Furnace.*—May 14, 1867.—The tuyere openings are wider at the lower side than at the top, and additional tuyeres enter the furnace at their lower level to cause a greater amount of draft at the bottom. Below the boshes is an enlarged space, near whose upper end is a horizontal series of air holes throwing jets of air upon the fuel.

Claim.—First, a cupola or blast furnace, the interior of the lower portion of which is composed of the chamber G, with vertical walls, and above the latter the basin-like chamber F, constructed at the top, all substantially as specified.

Second, the combination with a cupola or blast furnace of a system of tuyeres having openings so arranged as to discharge a blast of greater volume below than above, as set forth.

Third, the air openings *w*, arranged in respect to the projections *m* and basin-like chambers F, as described.

64,646.—WILLIAM DOUGLAS and H. M. INGLER, Bellair, Ohio.—*Oil Cup for Machinery.*—May 14, 1867.—The motion of the crank throws a jet of oil through the small hole in the conical top of the cup, which runs down the top of the cone and lubricates the wrist pin.

Claim.—First, the cone feeder D, constructed and arranged substantially as described for the discharge of the oil upward by the motion of the engine crank.

Second, the arrangement substantially as herein described for oiling the wrist pin directly in combination with an upward feeding oil cup.

64,647.—JAMES C. DUNCAN, Olney, Ill.—*Plow.*—May 14, 1867.—The moldboard, sole, and landside are swaged from a single plate cut to form.

Claim.—First, a plow, embracing the moldboard A, landside B, border or sole C, and heel brace D, all being united in one and the same piece of metal which is cut and shaped substantially as described and represented.

Second, the slotted rest D', when formed in one piece with the plow, and employed for the support of the beam G, substantially as and for the purpose specified.

64,648.—JAMES C. DUNCAN, Olney, Ill., assignor to himself and J. B. ALEXANDER, Washington, D. C.—*Portable Fence.*—May 14, 1867.—The rails are supported on a triangular trestle, whose struts extend from the ground to gains on the sides of the vertical slats which enclose the boards.

Claim.—The supporting trestle, consisting of the battens C C, braces E E, pins D, rails A, and cross-tie F, combined substantially in the manner and for the purpose specified.

64,649.—JAMES C. DUSTAN, New Vernon, N. J.—*Liniment.*—May 14, 1867.—Composed of arnica, 7; alcohol, 15; beef gall, 4; camphor, 2; oil of organum, 2 parts.

Claim.—An improved liniment, composed of the several ingredients combined in the proportions and manner substantially as and for the purposes herein specified.

64,650.—JULIUS ELSON, Boston, Mass.—*Breach-loading Fire-arm.*—May 14, 1867.—When loaded, the breach block containing the needle rests against the cartridge end; the expeller catches are beneath its flange and the block is locked in place and pressed forward. The needle is struck by the hammer to discharge the cartridge. On elevating the hammer to half cock, the breach block is released and drawn down by the spiral spring against the lower projections of the shell extractor and throws it into action. The breach block is again elevated by cocking the gun.

Claim.—First, the combination as well as the arrangement of the advancer H and its cam *g*, or operative mechanism, with the hammer and the breach block applied to the barrel and stock, and with the mechanism, as described, for elevating or depressing the breach block C, and bolting and unbolting it with respect to the barrel, substantially in manner as specified.

Second, the combination, as well as the arrangement of mechanical parts or instrumentalities for elevating and depressing the breach block C, and bolting and unbolting it with respect to the barrel, in manner as set forth, such parts or instrumentalities consisting in the hammer E, its pin *f*, and arm *g*, the lever or arm *e*, stud *e*, spring D, the bolt F, and its operative mechanism, substantially as described.

64,651.—LOT P. EVANS, Springville, Pa.—*Cherry Seeder.*—May 14, 1867.—The two cylinders have V-grooves inclining backwardly from their midlength

and interlocking each with the other. The cherries are carried downward and outward, the pulp falling between the rollers and adjustable abutment pieces and the stones running out down the tubular supports.

Claim.—The cylinders *b b'* and the plates *d d'*, arranged and operating with respect to each other, substantially as herein specified and described.

64,652.—GILBERT J. FERRISS, Washington, D. C., assignor to himself and BYRON SYKES.—*Combination Tool.*—May 14, 1867.—The wrench, screw-driver, bradawl (or gimlet), and claw hammer are associated in one combination, as explained by the illustration.

Claim.—The tool, as above described, operating in the manner and for the purpose set forth.

64,653.—EDWARD FITZKI, Washington, D. C.—*Envelope.*—May 14, 1867.—One flap has a slit and the other incisions in its edges, which may be folded together, inserted through the former, and then spread out to make a fastening.

Claim.—The application of incisions in the envelope of any size, style or materials, as fully described as above.

64,654.—GEORGE FLOYD, Cincinnati, Ohio.—*Insulator.*—May 14, 1867.—An enlarged chamber in the insulator receives the hook heads of the split shank, which expands so as to retain the insulator in place, and may be contracted to permit its removal.

Claim.—The chambered insulator provided with ledges *H H'*, approached by a flaring aperture *F*, in the described combination with the two-parted and shouldered shank, the said shank and chamber being oblong in their horizontal section, all substantially as set forth.

64,655.—P. S. FOSTER, Richmond, Me.—*Road Scraper.*—May 14, 1867.—For scraping snow. The front part is widened to clear a track for the runner. The bottom is opened to discharge the load, a scraper operated by a crank assisting.

Claim.—First, an improved scraper *A*, having tilting or pivoted bottom board *a'* and being adjustably pivoted to the runners *B*, constructed and operating substantially as herein shown and described and for the purpose set forth.

Second, the combination of the inside scraper *G*, and pinted rods *g'* with the scraper *A*, substantially as herein shown and described and for the purpose set forth.

Third, the combination of the crank-shaft *H* and ropes or chains *I* with the scraper *A* and inside scraper *G*, substantially as herein shown and described and for the purpose set forth.

64,656.—MOSES H. FREEMAN, Somerville, Mass.—*Pipe Wrench.*—May 14, 1867.—The jaws have transverse serrations; the moving one is elased to the shank and retained to any adjustment by a tooth which engages one of a series of notches on the shank, being held thereto by the spring.

Claim.—The combination as well as the arrangement of the clasp *D* and spring *H*, the tooth *a*, the series *C* of notches, the jaws *E A*, and the bar *B*.

Also, the combination as well as the arrangement of the lever *F* with the clasp *D*, the spring *H*, the tooth *a*, the series *C* of notches, the jaws *E A*, and the bar *B*, such bar being provided with a handle, and the whole being constructed so as to operate substantially as hereinbefore explained.

64,657.—ANDREW FRIBERG, Moline, Ill.—*Cultivator.*—May 14, 1867.—The lower end of the standard is rounded and the share is attached with a strap which allows side adjustment to throw the soil either way. A groove in the standard receives a projection of the share.

Claim.—Securing the share to the stock by means of the block *C* and stirrup *e*, when said parts are constructed and arranged substantially as herein shown and described.

64,658.—CHARLES R. GIBSON, Madison, Ind.—*Bench Vise.*—May 14, 1867.—The screw shank has a universal joint to accommodate it to vertical and transverse inclination in the moving jaw, the shank of which is swiveled at its foot. A conical pin tra-

verses the socket joint to render it stiff when desired.

Claim.—First, the combination of the jaws *A A'* with the universal jointed vise screws *B C D* and nut *F*, all constructed and arranged substantially as described.

Second, the combination of the jaws *A A'*, the stirrup *f f'*, block *G*, and pin *K*, all constructed and combined as set forth.

64,659.—JOSEPH GILBERT, Philadelphia, Pa.—*Fire-proof Ceiling and Roof.*—May 14, 1867.—The lower flanges of the girders supports the ends of curved plates which are corrugated in a direction transverse to their curve.

Claim.—First, a ceiling or roof composed of girders *A*, corrugated arched plates *B*, and socket bearers *d* adapted to the said girders and plates, the whole being constructed and arranged substantially as described.

Second, in combination with the above, the bricks or blocks *X X'*, applied in the manner and for the purpose described.

64,660.—JAMES E. GILLESPIE, Boston, Mass.—*Rod Cutter.*—May 14, 1867.—The rod is thrust through the openings in the opposite dies until it strikes the adjustable gauge. The movable die is then reciprocated by the lever *eam* and cuts off the length of rod. The movement of the gauge allows the severed portion to drop and the parts return to their normal position.

Claim.—A rod cutter, constructed and operated substantially as specified.

64,661.—C. C. GISH, Virden, Ill.—*Windmill.*—May 14, 1867.—The wings are forced outward by the action of the lever so as to catch the wind and rotate the wheel. The pump is operated from the wheel shaft through the medium of the eccentric end lever lifting the water into the receiver, whence it passes to the tank, the valve opening by the action of a float.

Claim.—First, a wind wheel, constructed substantially as shown, and provided with hinged wings *d* and rods *e*, sliding hubs *D E*, arranged in relation with water receiver *L* and loaded lever *G*, substantially as shown and described for the purpose specified.

Second, the float *P* in tank *Q*, the valve *N* in the water receiver *L*, and the lever *G*, all arranged to operate in connection with the wind wheel, substantially as described.

64,662.—WILLIS D. GOLD, Philadelphia, Pa., assignor to himself and PHILIPP FERMIER.—*Combined Hammer, Screw-driver, and Wrench.*—May 14, 1867.—One end forms a hammer, the other a screw-driver. One side of the shank has a series of square holes of varying size, and the other has flanges forming a tapering wrench.

Claim.—A combined hammer, screw-driver, and double wrench, having the characteristics and operating substantially as represented and described.

64,663.—J. H. GUILD, Rupert, Vt.—*Float Valve.*—May 14, 1867.—The liquid is fed through rubber pipes. When the water rises to a certain point it lifts a float which operates a system of levers to compress the rubber tube and stop the flow.

Claim.—The arrangement in the perforated vessel *A* of the float *B*, having the perforated or notched vertical rod *b* engaging with the pivoted oscillating lever *e* connected by the link *d* to the lever *e* pivoted to the opposite side of the vessel in such a manner that, as the float *B* is elevated by the water, the projection *f* upon said lever *e* presses against the elastic pipe *C*, effectually closing the same, substantially as described for the purpose specified.

64,664.—THOMAS G. HALL, New York, N. Y., assignor by mesne assignment to himself and E. HARREY GIFFORD, Brooklyn, N. Y.—*Nippers.*—May 14, 1867.—The movable jaw pivoted to the lugs is operated by the toe of the pivoted lever with which it is kept in contact by a spring. A set screw adjusts the inward pressure of the jaws.

Claim.—The lever *D*, handles *F* and *F'*, toe *b*, spring *f*, jaws *B C*, set screw *h*, constructed, arranged, and operating substantially as and for the purpose described.

64,665.—FREEMAN HANSON, Buxton, Me.—*Turn Table.*—May 14, 1867.—The bed is raised upon its base plate above the central stem by means of thrust screws which traverse the former and impinge upon the latter.

Claim.—The arrangement of the plate *c*, having its projections *f*, its part *h* and wheels *d*, plate *b* and projection *g*, all as and for the purposes described, when the said plate *c* is operated by means of the four screws *k*, in the manner herein set forth.

64,666.—JOHN K. HARRIS, Madison, Ind.—*Attaching and Detaching Horses, &c.*—May 14, 1867.—The reaction of the spring maintains the engagement until the bolt is withdrawn, when the inclined surface of the tongue forces the cross-bar off the lug and disengages the horse.

Claim.—First, the horse-hitching device, releasable by the driver, consisting essentially of the hooked plate *B*, self-engaging bolt *E* and buckle *R*, substantially as set forth.

Second, the buckle proper, consisting of the double tubular frame with the pair of spiral springs *P P'* and the draw-bar *O*, substantially as described.

64,667.—JAMES HATCH, Lynn, Mass.—*Apparatus for Destroying Insects on Trees.*—May 14, 1867; antedated May 1, 1867.—The tree is covered with a cloth and a smudge of smoke introduced through a pipe from a furnace to kill the insects.

Claim.—The fumigating furnace *c*, pan *d*, pipe *e*, and rack or cloth *b*, when used together in combination, substantially as and for the purpose specified.

64,668.—A. T. HEFLIN, Monmouth, Ill.—*Cultivator.*—May 7, 1867.—The pair of frames are pivoted in front to a wheeled carriage and have adjustable winged shovels.

Claim.—First, forming the shovels *I* with wings, the outer wing of each shovel being curved or turned up, substantially as herein shown and described and for the purpose set forth.

Second, the combination of the pivoted bar *D* with the beam *G* and vertical bar *a'* of the frame *A*, substantially in the manner shown and described and for the purpose set forth.

64,669.—JOHN HIGBIE, Rondout, N. Y.—*Manufacture of Vinegar.*—May 14, 1867.—Five bushels of apples, boiled to a mass, are laid on a floor in a barrel, 3½ gallons are leached therefrom, and 1 gallon of molasses added.

Claim.—The improved process for the manufacture of vinegar from apples, substantially as shown and described.

64,670.—GEORGE A. HILL and CONRAD LOHNES, Springfield, Ohio, assignor to themselves and JAMES M. HARNER, Donnellsville, Ohio.—*Seed Planter.*—May 14, 1867.—The double-sided plow has adjustable shanks attached thereto. The seed wheel has on its inner side a series of holes to receive pins regulating the seed valves. Scrapers clean the wheels. The lever pivoted below the flooring has a quadrantal cam eccentrically attached to it, and which, pressing on the tongue, raises the plows out of the ground.

Claim.—First, the combination of the double-sided plow curving upwards from near the point to the heel, and the shovels *O*, adjustably attached thereto substantially as and for the purpose set forth.

Second, the combination of the wheel *D'*, adjustable pins *D'*, lever *E*, and spring *E'*, substantially as described.

Third, the combination of the lever *E*, valves *F* and *F'*, and pins *F''*, with the compound lever *G*, having curved slots *G'*, in the outer ends, substantially as set forth.

Fourth, the combination of the compound lever *G*, valves *F* and *F'*, connecting bar *H*, lever *J*, hook *I*, and driver's seat *K*, substantially as described.

Fifth, the combination of the driver's seat *K*, lever *P*, cam *Q*, and tongue *R*, substantially as set forth.

Sixth, the combination of the tongue *R*, attached to the rear of the frame and the brace *T*, attached to the front thereof, and constructed and arranged to operate substantially as set forth.

64,671.—WILLIAM H. H. HINDS, Groton, Mass.—*Flame Regulator and Extinguisher for Lamps.*—

May 14, 1867; antedated May 6, 1867.—Two crescent-shaped pieces of metal are hinged one on each side of the aperture of a lamp deflector to regulate the aperture. The chimney holder can be turned to the right or left and the lower points of the crescent-shaped pieces are attached thereto, so that by turning the chimney the flame can be regulated or extinguished.

Claim.—First, the attaching of two pieces of metal made to close together around or above the flame to a cap, to which cap is attached a collar or chimney holder, when a chimney is used in such a manner that the said two pieces of metal shall form the vertex or top, or a part of the vertex or top of said cap, as herein described and as shown in Figs. 1 and 2.

Second, the closing and opening of the said two pieces of metal by means of a collar or chimney holder, as herein described and as shown in Figs. 1 and 2.

64,672.—HEINRICH HIRZEL, Leipsic, Saxony.—*Apparatus for Producing Gas from Petroleum.*—May 14, 1867.—Petroleum is pumped in a continuous jet into a retort heated to a red heat, and thereby immediately converted into gas; it is conducted to a condenser, where it is cooled and purified, and thence led to the gas holder.

Claim.—First, the pumps *V* and feed pipes *Q*, feeding the petroleum in a continuous jet to the retorts *A*, in combination with said retorts, substantially as above set forth and described.

Second, the clockwork mechanism *N*, or its equivalent, for working the pumps *V*, in combination with said pumps, operating in the manner and for the purposes substantially as set forth and described.

Third, the wings *R*, regulating the clockwork mechanism *N*, in combination with said clockwork.

Fourth, the condenser *E*, combined with the connecting tube *F*, the latter setting into the hydraulic main *C*, where the bench consists of more than one retort; or where one only is employed, the condenser *E*, furnished at its bottom with an hydraulic main, substantially as set forth and described.

Fifth, the hydraulic main *C*, in combination with the excess pipe or discharging tube *O*, stand pipes *B*, bell valves *D*, and connecting tube *F*, or their respective equivalents, all substantially as set forth and described.

Sixth, the trapped tube *I*, in combination with the condenser *E* and cistern *G*, substantially as described.

64,673.—JAMES G. HOLMES, Charleston, S. C.—*Portable Water Closet.*—May 14, 1867.—The vessel for the feces is placed in a pail which contains a quantity of water. A cover is inverted over the inner vessel and its submerged edges form a stench trap.

Claim.—First, in a portable water closet constructed substantially as described, the use of an exterior upright vessel and of an interior inverted vessel, so arranged as to prevent the escape of any fetid odor by means of a water packing extending to the lower portion of the exterior vessel, substantially as described.

Second, as a new article of manufacture, a portable water closet which is rendered inodorous by means of a closed inverted vessel with its water packing which extends to or below the bottom of the vessel which is to contain the feces, substantially as and for the purpose described.

Third, in a portable water closet the rendering of the same effective by means of an external vessel, an internal inverted vessel packed with water, while the vessel to receive the feces is separate and distinct from either of the others, substantially as described.

64,674.—E. HULBERT, Atlanta, Ga.—*Express Money Envelope.*—May 14, 1867.—Explained by the claims and illustration.

Claim.—First, the improved express money envelope formed with additional flaps *b' b'' e' e''* upon the side edges of the end flaps *B* and *B'*, substantially as herein shown and described and for the purpose set forth.

Second, forming holes through the side flaps *D* and *E*, in such positions that when the said flaps are folded and pasted down, said holes may correspond with each other to allow the sealing material to come in contact with the end and side flaps at the same time, substantially as herein shown and described.

64,675.—LAFAYETTE KRAMER, Point Pleasant, Pa.—*Beehive.*—May 14, 1867.—Movable boxes are fitted in a case for double or single hives, and so connected that a swarm of bees can be driven from one box into another which is empty.

Claim.—In a double beehive the combination and arrangement of the case A with the hinged lid B, and hinged door C enclosing the shifting boxes 1 2 in pairs separated by the partitions a and connected with the surplus honey boxes D D' D'', substantially as and for the purposes herein described.

64,676.—WM. H. LANDBECK, Rochester, N. Y.—*Wrench.*—May 14, 1867.—The ratchet on the moving jaw shank engages a pivoted ratchet block which is released by swinging out the other shank, in which position the jaws may be adjusted.

Claim.—The oblong plate F and spring E, the whole arrangement in the manner and for the purpose substantially as herein described.

64,677.—SIMON M. LANDIS, Philadelphia, Pa.—*Hot and Cold Air Baths.*—May 14, 1867.—A watertight enclosure in which the patient may be treated with hot dry air or with vapor simultaneously with currents of electricity. A shower bath is combined therewith.

Claim.—First, the falling shutter a with slide c, as set forth.

Second, foot stool L and seat stool 11, lined with tin or zinc, as set forth, in combination with the bath room.

Third, slides 2 and b and double door E and D, as set forth.

Fourth, double inclined floors 6 6 and 7 7, as described and set forth.

64,678.—CHARLES LEAVITT, Cleveland, Ohio.—*Fruit Dryer.*—May 14, 1867.—The fruit is spread on slatted shelves slipped into the case. The calorific current from the furnace passes by a flue to the chimney; the heated air and the moisture from the fruit pass through the open flues above and escape at the corners, which are thus included in the circulation.

Claim.—The herein described arrangement of the channels or flues C C' and D, in combination with the pipes K and O, case A, for the purpose and in the manner set forth.

64,679.—JOSEPH C. and DELOS P. LEONARD, Union City, Mich.—*Hop Frame.*—May 14, 1867.—The horizontal wires are supported by posts and pivoted inclined poles. The braced inclined poles are attached to the wires by the open slots.

Claim.—Improved hop frame or trellises, constructed of inclined stakes or poles D D, supported by horizontal wires or chains A, stretched and secured as herein described, all substantially in the manner and for the purpose herein set forth.

64,680.—THOMAS C. LITTLE, Dixon, Ill.—*Steam Generator.*—May 14, 1867.—Water is injected by a force pump against the heated surfaces. The devices are explained in the claims and illustration.

Claim.—First, the inner shell B, placed concentrically within the outer shell A, having a flue J between them for the passage of the products of combustion from the fire chamber G, the inner shell B, provided with a circular plate suspended from the rod N, against which the water from the injection pipe C is thrown, substantially as described for the purpose specified.

Second, the combination and arrangement of the shells A B, injecting pipe c, connecting pipe D, fire box G, and circular plate suspended from the rod N, substantially as described for the purpose specified.

Third, the fire box, constructed as described.

Fourth, the arrangement of the arm a, the connecting rod c, and the crank b, by which the valve is operated, in combination with the pipes D and C, for the purposes set forth.

64,681.—CHARLES LUXTON, Hudson, N. J.—*Peat Machine.*—May 14, 1867.—The prepared clay or peat falls from the hopper on one side of the octagonal roller, is pressed by the lever, and carried away on an endless apron. The lever is connected to a wrist pin on a revolving wheel, and operates the roller by a pawl.

Claim.—The octagon roller, in combination with

the lever for compressing peat, fuel, or for making bricks.

64,682.—T. E. MARABLE and GREY UTLEY, Petersburg, Va.—*Alarm Gun.*—May 14, 1867.—Four radial guns have a common nipple; a vertical spring hammer is sustained by a pin when cocked, and tripped by upper radial arms, to which wires from various points are attached.

Claim.—The combination of the horizontal and radial barrels, when fired at the center by a single cap, and vertical hammer in the top of the box, arranged and operated as herein set forth.

64,683.—H. H. MASON and JOSEPH MESSINGER, Springfield, Vt.—*Mop Head.*—May 14, 1867.—The staff has a screw sleeve which engages a socket screw on the head. The cross-bar is depressed by the rotation of the screw to clamp the fibrous material.

Claim.—The connecting of the movable jaw D to the nut C by means of the right and left screw threads on the ends of the jaws D, fitting in right and left female or internal screw threads m, ears or projections e c on the nut C, substantially as shown and described.

64,684.—M. MCGILL and JOSEPH E. TYNAN, Paterson, N. J.—*Street-lamp Lighter.*—May 14, 1867.—The body of the lamp is hinged in the case, and swings laterally to expose the flame, for lighting street lamps, &c. Side wings attached to the base form partial protection from wind.

Claim.—A hand lantern, constructed as and for the purposes described.

64,685.—ALLEN N. MERRILL, Batavia, Ill.—*Kettle.*—May 14, 1867.—The handle is rigidly attached to the lid, which is pivoted at the rear end and opens in a horizontal plane. Its fore end, when shut, is engaged by a lip and retained by a gravitating slide bolt.

Claim.—The eccentric hinge E, the lip F, the slide bolt G, and the wood handle H, in combination with the cover B, the arms C D, and the kettle A, substantially as described.

64,686.—FREDERICK MEYER, Newark, N. J.—*Machine for Grinding Scale Pivots.*—May 14, 1867.—A set of emery wheels are arranged on a stationary frame. The scale beam or lever is laid upon a horizontally-sliding carriage, and fed to the emery wheels, which grind and polish the pivots.

Claim.—First, the construction and arrangement of the longitudinally-sliding carriage C, reciprocating carriage B, and carriage E, as herein set forth for the purpose specified.

Second, adjusting the scale pivots to be ground on both sides by means of the set screws or pins k l, secured to the arm i of the sliding carriage E and bar H upon the frame A, substantially as herein set forth.

64,687.—JAMES MEYER, JR., New York, N. Y.—*Knife Sharpener.*—May 14, 1867.—The pair of sharpening plates are ordinarily carried in the handle, but for use are clamped at the end of the handle by a thumb screw.

Claim.—First, the cutting plates E E, provided with longitudinal rounded edges, and connected by a sliding joint, substantially in the manner as and for the purpose set forth.

Second, the combination of the handle A with the two pairs of cutters E E F F, the clamp at one end of the handle and the recesses in the same to receive the cutters, with or without the strap G, substantially as and for the purpose specified.

64,688.—WM. H. MILLER, Philadelphia, Pa.—*Fibrous Packing for Steam Engines.*—May 14, 1867.—Explained by the claim and illustration.

Claim.—A packing consisting of a hemp, cotton, or other fibrous filling made into the form of a hurl or roving, and covered with a fibrous cover, substantially as described.

64,689.—THOMAS S. MINNISS, Meadville, Pa.—*Car Coupling.*—May 14, 1867.—The stop trips the coupling pin on entrance of the link and keeps the latter horizontal when inserted.

Claim.—A stop or hook that will hang on top of the drawhead and swing by its own gravity across

the pin hole, which, in combination with the pin when it is dislodged, will make a complete counterbalance to the projecting end of the link to hold it horizontal, being a catch, trigger, and weight combined in a single piece, constructed and operated as and for the purpose set forth.

64,690.—GEORGE FRED. MORSE, Portland, Me.—*Throttle Valve.*—May 14, 1867.—The valve is cylindrical and has steam ports on opposite sides. A groove on its upper side in combination with a screw in the case prevents rotation, and the steam is admitted to this groove to aid in balancing the valve.

Claim.—The arrangement of the partially-balanced sliding throttle valve in its casing by means of its cylindrical form and by having the steam openings on one side and the channel *d* on the other side of the valve open to the admission and pressure of the steam to more than balance the area of the ports, so that the valve shall be pressed against the steam openings in the seat, but with so slight a pressure as to cause but little friction and require but little force to move it.

64,691.—H. M. MYERS, Alleghany City, Pa.—*Manufacture of Shovels.*—May 14, 1867.—The steel blank is cast with tangs for handle straps and a recess for the socket.

Claim.—A blank for a shovel blade and handle straps, when said blank is cast of steel, substantially as herein described and for the purpose set forth.

64,692.—JOHN NEFF, Jr., Pultney, N. Y.—*Pruning Shears.*—May 14, 1867.—The spring tends to open the shears, and its roller runs in a groove of the handle opposite to the one to which it is attached.

Claim.—The lever *C* and spring *D*, when made and arranged substantially as specified and used for the purpose set forth.

64,693.—THOMAS L. OGIER, West Chester, Pa.—*Buckle.*—May 14, 1867.—The two frames are pivoted together; one end of the strap is lapped around one portion of the frame, the other end is passed over the serrated bar of its frame and is pinched between it and the serrated edge of the other frame.

Claim.—The combination of the two parts *a f*, pivoted to each other and furnished with the roughened surfaces *c i*, for catching and clamping a leather or other flexible strap, substantially as and for the purpose described.

64,694.—A. M. OLDS, New York, N. Y.—*Folding Seat.*—May 14, 1867; antedated May 5, 1867.—The three legs are attached by a combined sliding band, lugs on which run in grooves in the legs. Plugs attach the usual webbing seat.

Claim.—First, the combination of the legs *A A A*, band *E*, and rings *B B B*, arranged substantially as and for the purposes set forth.

Second, the combination of the legs *A A A*, plugs *L L L*, and seat *M*, substantially as and for the purposes described.

64,695.—E. A. F. OLMSTEAD, New York, N. Y.—*Sweeping Machine for Railroads.*—May 14, 1867.—The frame of the rotating brush is swung up by the levers operated by the hand screw.

Claim.—The construction and arrangement of the levers *L M* of the same length, their inner ends slotted and pivoted together and to the stirrup *O* working vertically in the slotted support *P*, and adjusted by means of the hand screw *Q*, said levers near their outer ends pivoted to the supporter *N*, upon the platform *A*, and their outer ends pivoted to the rod *R S*, attached to the ends of the shaft *K*, respectively, whereby the said shaft and broom *G* are raised and lowered, substantially as herein set forth for the purpose specified.

64,696.—WILLIAM ONIONS, St. Louis, Mo.—*Cotton-bale Tie.*—May 14, 1867.—One of the hoop ends has a bent, wedge-shaped piece which is run up through the slot in the cast-iron block and acts as a cam to retain the other end, which is also run through the slot.

Claim.—The metal block *A*, in combination with the wedge-shaped metal piece *B*, secured to the bale

hoop end *C*, arranged and operating substantially as and for the purpose set forth.

64,697.—H. S. PALMER, Norvell, Mich.—*Manure Distributor.*—May 14, 1867.—The arm, in combination with the cam pulley, operates the distributor. The cam pulley is adjustable to or from the fulcrum to regulate the discharge.

Claim.—First, the cam pulley *H*, the arm *I*, and the hinged board or frame *G*, when constructed and operating in the manner and for the purpose as herein specified.

Second, the cam pulley *H*, in combination with the arm *I*, when so constructed that the pulley can be moved nearer to or further from the fulcrum, whereby the discharge may be regulated by altering the stroke of the teeth *J*.

Third, the hooks *B B*, the braces *D D*, and the strap or chain *F*, in combination, when arranged and constructed as herein specified.

64,698.—WILLIAM PATTERSON, Lowell, Mass., assignor to GEORGE T. COMINS, same place.—*Clothes Pin.*—May 14, 1867.—The teeth are split to give more readily when required and avoid breaking.

Claim.—The arrangement of the split teeth *C C*, in combination with the body *B*, constructed and operating in the manner herein represented and described.

64,699.—MARTIN PECHMANN, New York, N. Y., assignor to himself and J. F. C. PICKHARDT, same place.—*Bedstead Fastening.*—May 14, 1867.—The nuts are made in screw plugs that can be inserted direct into an auger hole, avoiding the necessity for a square mortise, and enabling the nut to be withdrawn by a screw-driver.

Claim.—The combination of a cylindrical nut *B* with a screw *A*, substantially in the manner as and for the purpose specified.

64,700.—JOHN W. PHILLIPPI, Stahlstown, Pa.—*Wagon Brake.*—May 14, 1867.—The coupling pole is slotted to permit the passage of the king bolt, and the hind bolster is supported on a roller attached to it and the axle by straps; these enter grooves in the roller and permit its rolling to allow the axles to approach and put the brake in action by bars running to the bolster from the brake bar.

Claim.—First, the bolster *A*, arranged and combined with the grooved friction roller *B* and axle *C*, by means of bands *b' b' b' b*, substantially in the manner and for the purpose as herein set forth.

Second, the rods *F F* and rods *e e*, as arranged for combining the brakes with the bolster and axle, substantially in the manner and for the purpose as herein set forth.

Third, the construction of an elongated slot *f* in the coupling pole, in combination with the bolster and friction roller, substantially in the manner described.

Fourth, the check or stop, as arranged and combined with the coupling pole, substantially in the manner and for the purpose as herein set forth.

64,701.—THOMAS POULTNEY, Baltimore, Md., and SILAS CRISPIN, New York, N. Y., assignors to THOMAS POULTNEY.—*Breech-loading Fire-arm.*—May 14, 1867.—The portion of the barrel removed to allow the introduction of the cartridge is bent down and forms a reinforcing flange on the right side of the barrel. The guiding stud within this cavity directs the course of the cartridge shell on ejection.

Claim.—The horizontal reinforce lip or projection described on the breech piece receptacle of breech-loading fire-arms of the class specified, said reinforce being formed and located substantially in the manner and for the purpose set forth, and having to serve in combination with it a guiding stud *z*, or its equivalent in effect, also as explained, for the purpose explained.

64,702.—J. C. PRUDEN, Athens, Ohio.—*Composition for Pencils.*—May 14, 1867.—Composed of alum, 1 oz.; sorghum sugar, 1 oz.; gum arabic, $\frac{1}{2}$ oz., dissolved in water; nut galls, $\frac{1}{2}$ oz.; coloring matter is added.

Claim.—An indelible pencil formed of the ingredients hereinabove named, mixed in, or about, the proportions substantially as described.

64,703.—GEORGE PUSTKUCHEN, Hoboken, N. J.—*Apparatus for Impregnating Wood with Tar and other materials.*—May 14, 1867.—The cylinder for receiving the wood is centrally supported in the steam boiler. One end communicates with the tar boiler and the other with an air-pump.

Claim.—First, an apparatus for impregnating wood, that is made and operated substantially as herein shown and described.

Second, the application of an air-pump for the purpose of impregnating wood, when combined with the cylinder C and boiler B, substantially as and for the purpose herein shown and described.

64,704.—WILLIAM QUAYLE, Warsaw, Ill.—*Door Holder.*—May 14, 1867.—The spring rod is inserted within the edge of the door, to the lower end of which is attached a corrugated rubber roller; the spring rod is operated by a crank and the door held in any position.

Claim.—Holding a door in any desired position by raising and lowering the rod C and its attachments, substantially as herein shown and described.

64,705.—ALEXANDER RANDALL, Allegheny City, Pa.—*Can for holding White Lead and other materials.*—May 14, 1867.—The upper edge of the metallic can has a bead which is engaged by the groove of the lid.

Claim.—The groove D in flange C of the lid A, when used in combination with the bead *f* of the body B of the can or vessel, said flange, groove, and bead being constructed, arranged and operating in the manner and for the purpose herein described.

64,706.—LEMUEL READ, North Brookfield, N. Y.—*Planing Machine.*—May 14, 1867.—The frame which contains the cutting apparatus is moved longitudinally over the lumber, a pinion on the frame engaging a rack on the inside of the bed frame.

Claim.—In a rotary planing machine moving the cutters over the material operated on instead of the said material under the cutters, by means of the crank F, pinion I, and rack L, pinion K, and sliding frame C, constructed and operating in combination, substantially as described.

64,707.—JACOB REEDY, Toledo, Iowa.—*Plow.*—May 14, 1867.—The adjustably-attached guard protects the plants from clods. The pulverizer is ranged diagonally at the rear of the shovels.

Claim.—First, the guard C, adjustably attached to the beam or standard of a shovel plow, so as to operate substantially in the manner and for the purpose set forth.

Second, the pulverizer F, adjustably attached to the standards or beam, so as to operate in rear of the shovels of a plow, substantially in the manner and for the purpose set forth.

64,708.—ELIJAH BEKFOR, Mentor, Ohio.—*Potato Digger.*—May 14, 1867.—The tines are thrust beneath the hill of tubers, which is lifted on to the screen; the vibration of the latter separates the mold, and the tubers are discharged.

Claim.—First, the mode of supporting the fork as described, so that it can be operated in the peculiar manner set forth by means of the guide C C, notched head E, spring catches G G, perforated rail D, ratchet and pawls J L, and handle M, or by means equivalent thereto, as and for the purposes stated.

Second, supporting the guides C C and perforated rail D, which carries the said fork on the axle-tree A and wheels B B, whereby I am enabled to use said axle-tree as a fulcrum for raising the said fork, with its contents as set forth.

64,709.—JAMES A. ROOT, East Canaan, and I. N. BARTRAM, Sharon, Conn.—*Smelting Furnace.*—May 14, 1867.—The cylindrical hearth is constructed of cut stone. The blast pipes are extensible.

Claim.—First, the constructing of the hearth of a smelting furnace of cut stone, having their inner surfaces rounded, so as to form an interior of inverted conical shape, with a solid or single stone extending across the passage *l*, substantially in the manner as and for the purpose set forth.

Second, having the lower parts of the blast pipe B,

formed of sections *c*, arranged to slide one within the other, substantially as and for the purpose specified.

Third, the glasses *f* in the pipes B, in combination with the openings *d*, substantially as and for the purpose set forth.

64,710.—J. ROWLAND, Brooklyn, N. Y.—*Locking Apparatus for Ferry Boats.*—May 14, 1867.—The curved-hinged bars beneath the guards are kept elevated by chains, which pass around pulleys on a shaft within reach of the pilot. These bars are kept at a proper elevation to engage weighted pivoted catch hooks beneath the edge of the wharf, which attachments are freed by raising the curved bars.

Claim.—First, the hooks *f f*, arranged on the underside of the bridge B, and weighted at their inner ends, substantially as and for the purpose herein shown and described.

Second, the bars *a*, arranged at each end of the boat, below the deck, and operated by the shaft *b* and end chains *c*, substantially as and for the purpose herein shown and described.

64,711.—GEORGE B. SALMON, St. Paul, Minn.—*Carriage Clip.*—May 14, 1867.—A hook below the thill-iron engages a bolt in the shackle. The convex back of the hook fits in the concave recess of the clip, with an intervening rubber plate to prevent rattling.

Claim.—The combination of the thill-iron E, clip B, and rubber plate G and bolt *b*³, the whole constructed and operating substantially as described and for the purposes set forth.

64,712.—R. SANDERSON, Cleveland, Ohio.—*Steam Governor.*—May 14, 1867.—The valve consists of two disks upon a rock shaft, which is actuated by pawls pivoted to the upper arms of a tri-armed lever, whose lower arm is connected to the eccentric rod. These pawls engage the upper end of a lever attached to the rock shaft, and whose lower end has a pin actuated by springs to restore the lever to the vertical and cut-off position on release of the pawls, which is effected by a yoke actuated by the governor to effect it sooner or later. The valve may be retained in its open position by a screw, which engages the upper end of the spring lever.

Claim.—First, the arrangement of the valve seat E and valves G, when operating conjointly in the manner substantially as described.

Second, the springs J as arranged in combination with the lever I, rock shaft H, and steam valve or valves, for the purpose and in the manner as set forth.

Third, the screw P as arranged in combination with the lever I, shaft H, and valves G, as and for the purpose substantially as set forth.

64,713.—COLEMAN SELLERS, Philadelphia, Pa., assignor to WILLIAM SELLERS & Co., same place.—*Turn Table for Bridges.*—May 14, 1867.—The turn table has an outer and inner cylinder resting on rollers, and connected by oblique brace bolts projected radially.

Claim.—The combination of the central cylinder M, radial bolts K and L and the cylindrical curb H, or its equivalent, substantially as described for the purpose specified.

64,714.—BENJAMIN A. SHAFFER, Cass county, Ind.—*Making Draining Tiles.*—May 14, 1867.—The rolling lever forms the hollow of the tile, being attached to a revolving pivoted head piece at one end and operated by a hand crank at the other.

Claim.—The lever or roller, as substantially described above, for making and forming underground draining tile, the said lever or roller working in a sliding mold or in any other manner substantially in the same.

64,715.—N. H. SHAW, Holderness, N. H.—*Attaching Thrills to Vehicles.*—May 14, 1867.—The coupling is made in two sections fastened each to the axle clip; the ears of the sections receive the bearings of the thill-iron spindle.

Claim.—First, suspending the shaft to its coupling on carriage axle, between two bearings or ear pieces thereof susceptible of adjustment, substantially as described.

Second, a shaft coupling having that part of the same attached to the axle made in two parts or sections secured and hung together at one end and one upon the other, with the shaft strap or bar suspended by a center bolt between car pieces at their other ends, substantially as and for the purpose described.

Third, the conical-shaped bearings between the shaft strap or bar and the part of the coupling secured to the axle, substantially as described.

64,716.—THOMAS SHAW, Philadelphia, Pa.—*Steam Whistle*.—May 14, 1867.—The steam being forced into the tube is obstructed by the partition, causing the current to flow through apertures into annular recess intervening between the tubes, from which it finds vent over apertures in the tube, causing rapid synchronous vibrations in the air.

Claim.—The combination of tubes *a* and *g*, as set forth, in combination with the apertures *f*, for the purpose specified.

64,717.—DAVID SHIVE, Philadelphia, Pa.—*Sweat Leather for Hats*.—May 14, 1867; antedated May 9, 1867.—The supplementary sweat leather has a flapped edge made to extend about half an inch on the rim of the hat to retain its position without stitching.

Claim.—The application to a hat of the supplementary sweat leather *B*, constructed and operating substantially as and for the purpose described.

64,718.—G. SIMPSON and R. M. TAYLOR, Waterbury, Vt.—*Billiard Register*.—May 14, 1867.—The registry is kept by graduated dials with indicators automatically operated internally by the ratchet wheels and notched disk. The bell gives notice when the game is up.

Claim.—The arrangement of the two external dials with movable hands *A A'* to indicate the points tallied by each player and the bell to give notice when the game is up, in combination with the internal notched disk *D*, spring finger and pawl *e*, used by a series of ratchet wheels *H I J*, having numbers to register and indicate the games played, the same being operated in keeping the tally, substantially in the manner herein described for the purpose specified.

64,719.—RUSSELL J. SKINNER, Chicago, Ill., assignor to MANUEL TALCOTT, same place.—*Chandelier*.—May 14, 1867.—A series of grooves are made at intervals upon the rod so that the spring catch may sustain the chandelier at any required height. The annular cap is raised when the reservoir is to be filled. An enclosing tube extends to where the arms connect with the central support, being attached to an annular sleeve from which rods extend to support the globes.

Claim.—First, the combination and arrangement of the rod *L*, tube *J*, reservoir *A*, tubes *B*, and wick cups *C*, operating substantially as and for the purposes specified.

Second, the arrangement of the spring catch *b*, or its equivalent, with the tube *J* and rod *L*, when provided with one or more grooves *e*, substantially as and for the purposes set forth.

Third, the combination of the sleeve *G*, arms *F*, and globe-rest *E* with the case *I*, arranged and operating substantially as specified and shown.

Fourth, the combination of the spool *N*, movable section *O*, and elastic band *R*, substantially as and for the purposes specified.

Fifth, the arrangement of the cap *a* with the reservoir *A* and tube *I*, or its equivalent, operating as and for the purposes specified and shown.

64,720.—WILLIAM H. STANTON, Dunmore, Pa.—*Safety-valve Device*.—May 14, 1867.—Steam from the generator enters the upper end of a vertical cylinder to whose piston rod the safety-valve lever is connected; steam also enters a lower horizontal cylinder having a port connected with the upper one. Within the lower cylinder is a spring-valve plunger forced by extreme pressure to open the port and balance the steam pressure on the piston to allow the pressure beneath the safety-valve to open it.

Claim.—First, the combination of the piston *B* in the cylinder steam channel *C D*, opening into the clinder *a* above the piston, and at *b e* below the piston, piston *J*, spring *K*, and set screw *m*, substantially as described and for the purpose specified.

Second, the plunger *J*, the spring *K*, the channels *C D*, the apertures *a b e* and the set screw *m*, arranged and operating substantially as described in combination with the cylinder and the piston, for the purposes set forth.

64,721.—G. W. STOCKTON, Oquaka, Ill.—*Cultivator*.—May 14, 1867.—The forward ends of the plow beams are attached by a clevis to a swivel rod working in the bar above and are supported on wheels. The plows are regulated by handles braced to the rear ends of the beams. The double-tree attached to the rear end of the draft pole operates as an erener by its connections with the forward bar and the wheels.

Claim.—The swivel rods *G*, in combination with the joint or pivoted clevises *c*, the draft-evening device *K*, and bent bars *L*, arranged and operating substantially as described and for the purpose specified.

64,722.—EDWARD TANGYE, Brussels, Belgium.—*Apparatus for Welding Chain Links*.—May 14, 1867; antedated April 26, 1867.—The upper die is actuated by the plunger of a hydraulic press. The dies when closed cover the whole of the link operated upon except the interlocking portion. The dies are grooved to receive the end of the previously welded link.

Claim.—The improvements in tools for welding the links of welded iron chain and welded steel chain, hereinbefore described and illustrated in Figs. 1, 2, 3, and 4 of the accompanying drawings.

64,723.—FREDERICK W. TILTON, Bristol Station, Ill.—*Combined Seeder and Cultivator*.—May 14, 1867.—The roller supports the weight of the main part of the machine, and the bevel gear wheel thereon operates by its connections the adjustable seed box, from which the seed drops through the hollow teeth on the cultivator frame.

Claim.—First, the connected frames *B* and *C*, carrying the teeth *I* and roller *D*, in combination with the beam *N* and its connections, for adjusting the depth to which the teeth may operate, all substantially as and for the purpose herein set forth.

Second, in combination with the roller *D* and framing *B*, the gearing *D' E*, and universal joint *e*, provided with the lever *J* and spring *K*, for bringing the gearing into action with a yielding force, and allowing it to be thrown out of and into gear, substantially as and for the purpose herein specified.

Third, in combination with the roller, parts *D C*, the cultivator parts *B I* and the drilling mechanism *G M A*, with their several connections, adapted to operate conjointly, substantially in the manner and for the purpose herein set forth.

64,724.—CHARLES R. TOMPKINS, Rochester, N. Y.—*Step for Upright Shafts*.—May 14, 1867.—The inside brass sleeve has projections closely fitted in the shell, leaving spaces for the circulation of oil. The steel screw that supports the shaft is removable to clean out the sediment, and the cover for replenishing with oil.

Claim.—The inside sleeve *b* with its projections, and the oil chamber *d d'*, in combination with steel screw *g*, substantially as described.

64,725.—JOHN VAN, Cincinnati, Ohio.—*Cooking Range*.—May 14, 1867.—Beneath the boiler on the sides of the fire space are openings furnished with dampers and leading to the oven-heating flues to draw the flame laterally from beneath the boiler, to avoid singeing the meat and to make the drip available for heating the ovens.

Claim.—The arrangement of broiler or fire chamber *B*, having both descending and ascending valve-guarded communications *O P*, with the flues *K L M* of one or more elevated ovens *J J'*, at the discretion of the operator.

64,726.—THOMAS and JOHN WALSH and DAVID EVANS, Brownsville, Pa.—*Brick Machine*.—May 14, 1867.—The moistened clay is tempered by the pins on the shaft. The slides force charges of clay into the chamber, whence it is forced by a plunger into molds in a slide beneath. The latter is retracted, and the bricks are discharged by another plunger.

Claim.—First, the slotted and grooved plunger *I*, working in the chamber *J*, provided with the partitions *o*, in combination with the plungers *b* and the

slide N, provided with the molds *h*, all arranged substantially in the manner as and for the purpose set forth.

Second, the slides M, working through the hoppers K K, and in openings *d* in the sides of the chamber J, in combination with the rotary shafts L, provided with the pins *c*, substantially as and for the purpose specified.

Third, the combination and arrangement of the reciprocating slide N, provided with the openings or molds *h*, the plungers I *l*, chamber J, slides M, and hoppers K K, provided with the rotary shafts L, having pins *c* attached, all arranged substantially as and for the purpose set forth.

64,727.—G. A. WATKINS, Proctorsville, Vt.—*Seat Frame for Chairs.*—May 14, 1867.—The pieces of the chair seat frame are dowelled together, and the intersections united by angle plates to which the legs are attached by bolts.

Claim.—Securing the legs to the seat of the chair by means of the metallic corner pieces I, provided with the perforated extension plate K bent at right angles thereto, and forming nuts to receive a bolt passing through the leg of the chair, substantially as herein shown and described.

64,728.—HERMAN WOLF, Avon, Pa.—*Adjusting Screw for the Legs of Fanning Mills.*—May 14, 1867.—The pointed screw bolts equalize the legs and steady the mill on the floor.

Claim.—The construction and arrangement upon the legs of a fan mill or other machine of the bars D, with their ends bent at right angles and perforated to receive the adjustable pointed screw E, provided with the handle F, as herein set forth for the purpose specified.

64,729.—JULIUS WOOD, Smyrna, N. Y.—*Hay Unloader.*—May 14, 1867.—Three books and ropes are laid in the bed, the load piled on, and when moved to the barn or stack is rolled off the wagon by horsepower, operating through ropes, head piece, and pulleys.

Claim.—The combination of the hooks, ropes, and head piece, or their mechanical equivalent, as and for the purposes herein set forth.

64,730.—ISAAC F. WOODWARD, Philadelphia, Pa.—*Water Indicator for Boilers.*—May 14, 1867.—The float has a vertical tube ascending within an open-bottomed glass tube through which the rod head can be seen.

Claim.—A glass tube having a closed top and lower open end communicating with the steam space of a boiler in combination with an indicating rod arranged to slide in the tube and connected to or controlled by a float, all substantially as and for the purpose herein set forth.

64,731.—JOHN N. WOODWARD, Aurora, Ill., assignor to himself and THOMAS ARENSER, same place.—*Paint Brush.*—May 14, 1867.—A piece of flexible sheet metal is cut so as to have two eyes to go over the handle, and a band connected thereto to envelop the upper end of the brush.

Claim.—The band A, with eyes, tongues and slots, as described, for attachment adjustably to the outside of paint brushes, substantially in the manner set forth.

64,732.—W. T. WYLIE, New Castle, Pa.—*Shaving Brush.*—May 14, 1867.—The saponaceous material is contained in the hollow handle and expressed therefrom by the screw piston so as to be disseminated among the bristles.

Claim.—The arrangement of the case C, piston E, screw I, nut E, and cap G, as and for the purpose described.

64,733.—J. S. ALLEN and O. GILLMOR, Norwich, Conn.—*Claw for Drawing Nails.*—May 14, 1867.—The tongs have down turned jaws and a fulcrum block.

Claim.—The combination of the pivoted fulcrum piece C with the gripping jaws formed upon the two levers A B, substantially as herein set forth for the purpose specified.

64,734.—N. AMES, Saugus Centre, Mass., and J. E. GOWAN, Stoneham, Mass., assignors to A. B. ELY, Newton, Mass.—*Eyeletting Machine.*—May 14, 1867.—The material is fed upon a sliding table, the holes punched and the eyelets inserted and headed. Cannot be briefly described other than substantially in the words of the claims.

Claim.—First, the combination of a vertically reciprocating puncher and header, each acting independently of the other, with a heading seat confined to and reciprocating in the same vertical plane, all arranged and operating so as to act at the same fixed points, substantially as described.

Second, supplying the eyelets from a common hopper to the heading seat or holding point by means of the endless belt and groove, substantially as described.

Third, the combination of a horizontally reciprocating supporting table with a vertically reciprocating puncher, header, and heading seat, all arranged and operated in relation to the same fixed point, substantially as described.

Fourth, the work feeding device, constructed and arranged with an eyeletting machine, substantially as described.

Fifth, the adjustable gauge, in combination with the reciprocating table for regulating the setting lines of eyelets, substantially as described.

Sixth, punching the holes by the vertically reciprocating movement of the puncher in connection with the punching table, furnishing the eyelets, and inserting and heading the same by the vertically reciprocating action of the heading seat, at the same fixed point, automatically, substantially as described.

Seventh, the reciprocating punching table and heading seat, so combined, arranged, and operated as to alternately occupy the same place for punching the holes and heading the eyelets at the same fixed point, substantially as herein described.

64,735.—CALVIN BAKER, Weymouth, Mass.—*Pump.*—May 14, 1867.—The induction valve has its seat on the side of the barrel, which surmounts a close chamber in which sand and earthy particles are collected.

Claim.—The combination as well as the arrangement of the chamber H, the pump barrel A, the induction conduit G, the valve E, and the box B, the whole being made to operate substantially as described.

64,736.—C. L. W. BAKER and L. S. HILLS, Hartford, Conn., assignors to LESTER S. HILLS and GEORGE D. JEWETT.—*Shoe-brush.*—May 14, 1867.—The tubes and grooved plug regulate the amount of blacking distributed among the bristles of the brush.

Claim.—The stopper *k*, with the tube or tubes *h*, brushes *e e'*, and receptacle *c*, substantially as and for the purpose described.

64,737.—ROYAL M. BASSETT, Derby, Conn., assignor to himself and THEO. S. BASSETT, same place.—*Rolling Mill.*—May 14, 1867.—The lower box rests upon and is vertically adjusted by a wedge beneath, which is moved in its seat by a screw shaft whose hand wheel rises above the pit.

Claim.—The employment, in combination with the box of the lower roll, of the adjusting wedge L, inclined seat K, screw shaft P, and hand wheel S, or its equivalent, the whole to operate as specified for the purpose set forth.

64,738.—W. W. BATCHELDER, New York, N. Y.—*Lighting Gas.*—May 14, 1867.—The fuze is made highly inflammable by treatment with collodion and phosphorus dissolved in bi-sulphide of carbon, and is enclosed in an annular case which fits upon the gas-burner. It is coiled upon a friction sleeve which encircles the part of the case over the burner, and is fed out through a tube by a rotary spindle, in the top of which is a pin that strikes and ignites the fuze.

Claim.—First, the mode or process herein described of rendering a cord or tape combustible and inflammable by friction, substantially as set forth.

Second, the cord or tape coated with the ingredients and in the manner herein specified.

Third, the application to and combination with a gas burner of otherwise ordinary or suitable construction, of a device composed of the following elements, viz:

1. A receptacle for the fuze or igniting cord.

2. A tube through which the fuze is conveyed from the receptacle to within igniting distance of the gas issuing from the burner.

3. A friction device to ignite the fuze at the end of the tube.

4. A feeding mechanism to supply the fuze to be burned.

Fourth, the fuze receptacle made annular so that it may be mounted upon the burner, substantially as set forth.

Fifth, the combination with the receptacle and tube containing and conveying the fuze, as described, of a friction device operated by a rotary spindle, substantially in the manner and for the purposes set forth.

Sixth, the combination with a rotary spindle carrying the friction device of an endless screw and feed rack, under the arrangement described, so that by rotating the spindle the said rack shall be revolved and effect the feed of the fuze, substantially as herein shown and specified.

Seventh, in combination with the fuze receptacle and the feed and friction device, the device herein shown and described, or the equivalent thereof for checking the retraction or backward movement of the fuze.

64,739.—WM. W. BATES, Chicago, Ill.—*Hang-ing Center Boards of Vessels.*—May 14, 1867.—The center board is pinned to a metallic frame instead of to the side of the case as is usual, and the frame is hinged within the case.

Claim.—The suspending the center boards of vessels by means of the frame B, in combination with the plates D, constructed and arranged substantially as described.

64,740.—CHARLES P. BELL, Nashua, N. H.—*Window-blind Fastener.*—May 14, 1867.—The hollow cast-iron tube inserted in the bottom of the blind encloses the spring projector of the thumb latch, automatically fastening the blind when it is closed; the thumb piece detaches the catch.

Claim.—The stem B, provided with a thumb piece upon its side and a catch upon its lower end when used in combination with the socket or tube A, provided with an opening or slot in its side to receive the thumb piece, and with a coiled spring C, which surrounds the stem, as and for the purpose herein specified.

64,741.—JONAS BERGER, Knoxville, Ill.—*Melodeon.*—May 14, 1867.—Five different qualities of tone are produced in a reed instrument by a double set of reeds and four swells actuated by a series of levers. The double bellows is arranged perpendicularly, and the keys united by diagonal couplings.

Claim.—In the construction of an upright melodeon, arranging four swells and springs with the double reed boxes and bellows, and combining therewith the double series of levers, as arranged for operating the swells, substantially in the manner and for the purpose as herein set forth.

64,742.—A. W. BROWNE, Brooklyn, N. Y.—*But-ton.*—May 14, 1867.—The ends of the stem have hooks, which point in opposite directions and pass through slots in the button head, and are turned to embrace the bridge.

Claim.—The fastening device consisting of the retainer B, the ends of its stem or shank being provided with hooks S, projecting inwardly or toward each other, in combination with the plate or button head A, which is provided with the bridge or eye I, substantially as described.

64,743.—SAMUEL BRYAN, Jefferson, Wis.—*Corn-stalk Cutter.*—May 14, 1867.—The reel bends the stalks backward against the knives, and, as they are cut, throws them over on to the cradle. When a bundle is gathered the machine is stopped, the bundle is drawn together by the cord from the crank-shaft, and is then bound by cord from the spool.

Claim.—First, the frame, consisting of the bars A and U mounted on the wheels B, with the curved axle O, and knives K, arranged as shown and described.

Second, the swinging frame G, arranged to receive and hold the cut stalks, as set forth.

Third, in combination with the swinging frame G

the windlass Y, with its cord *a*, arranged substantially as set forth, for compressing the bundles for binding.

64,744.—CHARLES W. CARDOT, Fredonia, N. Y.—*Harvester.*—May 14, 1867.—The combined shoe and gear frame is journaled to the axle of the driving wheels, which support the crank shaft and gearing.

Claim.—In a two-wheeled machine, a compound gear frame and shoe, composed of the parts *c*¹ *c*² and *c*³ *c*⁴ *c*⁵, and hinged to the axle of the driving-wheels, the whole being constructed, arranged, and operated in the manner substantially as set forth.

64,745.—CHARLES W. CARDOT, Fredonia, N. Y.—*Attaching the Draft Pole to Mowing Machines.*—May 14, 1867.—The gear frame and shoe are journaled to the axle of a two-wheeled machine, and have the point of attachment of the draft between the axle and the shoe.

Claim.—In a two-wheeled machine having a gear frame shoe constructed as herein described and journaled to the axle of the driving-wheels, the attachment of the draft pole to such frame at a point or points between the axle and shoe, for the purpose and substantially as described.

64,746.—CHARLES W. CARDOT, Fredonia, N. Y.—*Draft Pole for Mowing Machines.*—May 14, 1867.—The draft pole has a movable sleeve in combination with a sliding rod, pulley, and chain, so arranged that the backing of the team will cause the finger bar to be elevated.

Claim.—A draft pole having a removable push-back iron or sleeve C, in combination with the sliding rod B, pulley D, and chain *b*¹, constructed, arranged, and operating substantially as herein described.

64,747.—ANDREW CARSON, Memphis, Tenn.—*Plough.*—May 14, 1867.—The adjustable cutter travels ahead of the shovel to cut the roots, and has brace-rods above and below the beam. The projection of the cutter is regulated by notches therein, which engage the diagonal band.

Claim.—First, the herein-described construction of the shovel A, with the steel laid on the front side, and its turned up edges B in combination with its center C. Second, the diagonal band D, constructed as described and shown.

Third, the center C with its notches.

Fourth, the braces E and F, in their relation to the beam H and standard I, all arranged as and for the purposes specified.

64,748.—O. B. COLCORD, Greenville, Ill.—*Field Roller.*—May 14, 1867.—Each roller has a separate frame pivoted by axles on its side beams, to allow an independent vertical or longitudinal play to accommodate itself to irregularities in the ground. The adjustable ballast box slides in slots, and is secured by set screws.

Claim.—First, the combination and arrangement of the frame A with the oscillating frames B' B', substantially as described and set forth.

Second, the adjustable device C c, C², for the purpose of changing the ballast box forward or backward, substantially as described.

64,749.—J. C. COUNTS, Cross Roads, Ohio.—*Fruit Gatherer.*—May 14, 1867.—The fingers are attached to a long pole and provided with a jaw to seize the fruit, and a bag or receptacle for holding it when picked.

Claim.—An apparatus for gathering fruit, constructed with the parts A B C D and E respectively, constructed and arranged substantially as set forth.

64,750.—JACOB G. CROCKETT, Portsmouth, N. H., assignor to himself, JOHN J. FLANDERS and JOHN W. HAYES.—*Balance Valve for Steam Engines.*—May 14, 1867.—Explained by the claims and illustration.

Claim.—First, the arrangement of two valves on the same shaft, so that the shaft shall hold the valves against the pressure of the steam, and relieve the valve seats from the pressure of the valves, substantially as herein set forth.

Second, the devices described for traversing one of the valves on the shaft to adjust both to their seats, substantially as described.

64,751.—JOHN B. DECK, Martinsburg, W. Va.—*Repairing Railroad Rails.*—May 14, 1867.—The anvil has recesses to receive the dies. The dies are hinged together at their lower ends, and each pair thus constituted is attached to the end of a lifter.

Claim.—The anvil A, with its recesses and grooves combined with the dies B B', lifters C C', and levers D D'. Arranged and operating substantially as and for the purpose set forth, and this whether the anvil be furnished with one or more pairs of dies with lifters and levers, as described.

64,752.—HENRY L. DICKENSON, East Berlin, Conn.—*Measure and Funnel Combined.*—May 14, 1867.—The measure stands on legs and has a shallow, inverted conical bottom, with a central valve, kept closed by its gravity. A spiral spring on the valve stem is connected to a funnel tube which is placed in the mouth of the jug, raising the valve and discharging the liquid.

Claim.—The combination of the measure A and nozzle C with the valve G, sleeve C', and spring E, substantially as and for the purpose described.

64,753.—HENRY EVERDELL, New York, N. Y.—*Envelope.*—May 14, 1867.—One wing of the back is slit so as to make a strap, beneath which the tongue of the other wing is slipped; the latter has a bow knot resembling a fastening.

Claim.—The envelope, constructed substantially as described with a flap and tongue, the latter fitting through an incision in a closed wing or portion of the back, and the tongue or flap and wing into which it fits being embossed and provided with a bow or knot to give a secured aspect to the envelope while it is left free to open, yet protected against flaring open, substantially as specified.

64,754.—GEORGE FEIGHTNER, Wooster, Ohio.—*Machine for Making Wagon Clips.*—May 14, 1867.—The end of the blank is split to form the base of the clip, the ends are turned out and worked to form; the heated blank is then clamped between the die blocks while it is completed with the hammer.

Claim.—The stationary die G and movable dies C F, in combination with the die box B, constructed as and for the purpose set forth.

64,755.—HENRY FESSLER and ISAAC E. BETZ, Canton, Ohio.—*Combined Hoe and Hand Planter.*—May 14, 1867.—The cylinder is partially revolved, causing the recess of the plug to pass within it and fill with seed; by turning the cylinder back again till the recess corresponds with the opening, the grain drops out.

Claim.—The cylinder E, as constructed and used in combination with the plug C, with its set screw and seed recess, and handle D and A, as and for the purpose specified.

64,756.—FERDINAND FISHER, Cambridge, Mass.—*Steam Heating and Ventilating Apparatus.*—May 14, 1867.—The steam is exhausted through a drum containing pipes through which air is driven by a blower.

Claim.—The apparatus above described, for utilizing exhaust steam for the purpose of heating and for ventilating apartments or buildings, consisting of the tubular drum A, with its induction and eduction pipes d e, and the blower or blast apparatus B, combined and operating as set forth and explained.

64,757.—GEO. B. GARLINGHOUSE, North Madison, Ind.—*Knuckle Joint.*—May 14, 1867.—The curved edges of the adjacent pieces roll upon each other, segment cogs preserving the relation and links preventing separation.

Claim.—A knuckle joint, provided with cylindrical terminations adapted to roll upon each other, and held in place by racks and links, or their equivalents, substantially as set forth.

64,758.—DAVID GATES, Captina P. O., Ohio.—*Churn.*—May 14, 1867.—The dasher is supported by three rods, and is kept in position by a rod or stand-ard rising from the bottom of the churn.

Claim.—The combination of the radial dashers G with the center tube M, between the posts P P P and cross braces J and L, when constructed, arranged and

operated as herein described and for the purposes set forth.

64,759.—E. GRATTON, Williamstown, Mich.—*Feed Rack.*—May 14, 1867.—The hay rack has a sheltering roof with a perforated bottom and receptacle for hay seed. A small trough with divisional staples is provided for small stock, and a larger one which may be reversed and discharged into the former.

Claim.—First, the combination of troughs O and H, constructed and operating in the manner and for the purpose herein set forth. Second, the receptacle F, constructed as and for the purpose described.

Third, the troughs O and H, in combination with the adjustable sides C and rack bars n, and the perforated bottom F, the whole constructed, arranged and operating as and for the purpose herein specified.

64,760.—WM. GRIFFETH, North East, Pa.—*Propagating Grape Vines from Single Buds in the Open Field.*—May 14, 1867.—The short cuttings are set in the ground with the buds even with the surface; this is covered with unfermenting mulch, which is removed at a later period.

Claim.—The mode of propagating grape vines, substantially as set forth, in open field culture, by covering single bud cuttings with a cold mulch, applied in sufficient depth to keep down the temperature of the bud, and thereby retard its sprouting until the roots have been adequately developed.

64,761.—LUTHER HALL, Boston, Mass., assignor to ALFRED B. ELY, same place.—*Eyeletting Machine.*—May 14, 1867.—The article is placed beneath the presser and punch; the punch and set are respectively over the place to be punched and over the lower eyelet, and are depressed. The operation of the wheel and the cams brings the set on the pin which rises to meet it, and the eyelet is inserted and headed down, and after the parts are withdrawn the material is fed for a repetition of the operation.

Claim.—First, the laterally-sliding head or carrier, in combination with the punch and set, constructed, arranged, and operating in the manner and for the purpose substantially as described.

Second, the head or carrier so constructed and operated as to allow the punch and set to be alternately depressed by the same lever, substantially as described.

Third, so constructing the mechanism that the punching table and setting bed shall reciprocate laterally, alternately occupy the same place, the holes be punched, and the eyelets set at the same time, in the manner substantially as described.

Fourth, feeding the material forward after the eyelet is set and away from the setting point, by means of the solid pointed setting bed, under an arrangement and combination of parts substantially as described.

Fifth, the constantly-pressing spring-presser foot, in combination with the feeding mechanism as described, stripping the material as it is eyeleted from the constant grasp of the table and the foot, under an arrangement of parts as set forth.

Sixth, the hopper for holding the eyelets, in combination with agitating devices as described, and the adjustable chute provided with the enlarged receptacle or disk at its lower end, constructed and arranged as and for the purpose set forth.

Seventh, the setting die, so constructed and operating as to pick up the eyelets from the enlarged receptacle in the chute by adhesion, and present them to the place of insertion, substantially as described.

Eighth, the combination of the levers V and F and pin S, operating in the manner and for the purpose set forth.

Ninth, the striking lever, so constructed and arranged as to cause the set to be forced into the eye of the chute and pick up the eyelet while the punch is making the hole for its reception, substantially as described.

Tenth, the combination of plates Q and R, arranged and operated as described.

Eleventh, punching the holes, supplying, inserting, and setting the eyelets, adjustably spacing the distances, and feeding forward the work by means of devices, so combined as to effect these objects auto-

matically, when constructed, arranged, and operated in the manner described.

64,762.—JOHN LUKE HANLY, San Francisco, Cal.—*Anchor Stock.*—May 14, 1867.—The flange on the stock passes through the key seat in the shank; the stock is then partially rotated and a spline key is driven through a seat in the shoulder and the key seat of the shank.

Claim.—An anchor stock C, in combination with the permanent flange C and removable key D, substantially as and for the purpose herein set forth.

64,763.—HENRY HANNEN, Philadelphia, Pa., assignor to S. A. HANNEN and S. W. GREENE, same place.—*Manufacture of Carbonate of Lead.*—May 14, 1867.—The lead in fine plates or shavings is placed on perforated trays in the chamber and treated alternately with dilute acetic and carbonic acids, the whole being kept warm by a steam coil.

Claim.—First, the manufacture of carbonate of lead by the action upon metallic lead or oxide of lead of water, acetic acid, and carbonic acid gas, when the said fluids are brought in contact with the lead, substantially as described.

Second, subjecting the lead to the action of carbonic acid gas under a pressure, substantially as and for the purpose set forth.

Third, subjecting the lead, during the process of its conversion into a carbonate, to the action of chlorine, for the purpose specified.

64,764.—ANDREW HARTMAN, Canton, Ohio.—*Railroad Switch.*—May 14, 1867; antedated May 5, 1867.—The switch is connected to two L-shaped levers, by which the cars act upon it to change the connection, a foot being let down from the car for that purpose. A spring throws the main track in connection after the passage of the cars. The switch may be fixed to either adjustment, but may be tripped and the connecting spring thrown in operation by the passing engine.

Claim.—In an automatic switch the arrangement of the plate *b* with tumbler *g*, weight *m*, trigger *n*, and spring *s*, operated by the shoe *q* and eccentric *C*, connected to the railroad car and rail respectively, when used in combination with the plate *E*, levers *D D'*, connected by the rods *d*, and operating in the manner substantially as specified.

64,765.—JOSEPH HAWKINS, West Windsor, N. J.—*Hinged Gun Rest.*—May 14, 1867.—The jointed rod is hinged to a sliding piece beneath the barrel and is let down for a rest.

Claim.—The slide *F* and jointed rod *G* in combination with the plate *D* beneath the barrel *B* of a firearm, the whole being constructed and arranged as described.

64,766.—EDWARD HEATON, New Haven, Conn., assignor to C. B. WHITTESEY, same place.—*Suspensory Bandage.*—May 14, 1867.—The pouch is attached to the strap which is buckled around the body, and small straps attached to the bottom of the pouch pass to the rear and are attached to the back portions of the strap.

Claim.—The combination of the pouch *A*, having the opening *C* protected in the manner described, with the body piece curved, formed, and attached thereto, as shown and described, and the straps *D* and *E*, also curved, formed, and attached to the said body piece, as set forth, the whole constructed and arranged in the manner herein specified.

64,767.—ROBERT HOWDON, Cincinnati, Ohio, assignor to CRANE, BREED & CO., same place.—*Securing Wood to Metal.*—May 14, 1867.—Metal is poured into the divaricating or spreading holes which are made in the objects to be united, and assumes a shape which opposes retraction.

Claim.—Securing wooden or like objects to metallic surfaces, &c., by casting Babbitt or other metal of easy fusion into flaring or branching holes *C D*, and otherwise, as herein shown and described.

64,768.—JOHN S. HULL, Cincinnati, Ohio.—*Lamp.*—May 14, 1867.—A packing cap covers the end of the piston of the air pump. The valve rod extends

through the lamp reservoir so as to place the adjusting device in the base of the lamp.

Claim.—The cap *B*, as applied to the condensing pump *A*, and in combination therewith, for the purpose herein specified.

Also, the extension of the valve rod through the lamp reservoir, and the arrangement of the valve-adjusting device connected therewith in the base of the lamp, as herein set forth.

64,769.—JOHN S. HULL, Cincinnati, Ohio.—*Generator for Vapor Lamps.*—May 14, 1867.—The oil enters by a lateral pipe and is conducted in a circuitous course through the jaws so as to be vaporized; it then issues into the lower part of the stem, passes up, and is ignited between the jaws.

Claim.—First, the chamber *B* of a gas generator, when constructed with lips *I I'* projecting above the point of ignition and in immediate contact with the flame, the oil being conducted through them in tubes *C* and *C'*, substantially as set forth.

Second, in combination with the opening *M* through the chamber *B* connecting with the internal chambers *G*, the adjustable collar *K*, for regulating the supply of atmospheric air, substantially as and for the purpose set forth.

Third, the chamber *B*, when constructed with pipes *C C'*, lips *I I'*, and openings *B²* and *M*, arranged substantially as and for the purpose set forth.

Fourth, the receiving chamber *D* formed in the boss *L*, with its induction and ejection openings, when the flow of gas through the same is regulated by a valve *E*, substantially as set forth.

64,770.—ANDREW JOHNSON and W. H. ELLIOTT, Bloomington, Ill.—*Motive Power.*—May 14, 1867.—Within the rim of the partially submerged wheel is a series of air-tight expansible bags, which are in turn filled with air as they reach the lowest point in their revolution, and the air from which is allowed to exhaust as they leave the water.

Claim.—The motive power which is constructed and operated substantially as herein described.

64,771.—F. KEEFER, Greenfield, Ind.—*Hand Plow.*—May 14, 1867.—The plow shank is adjusted to the depth required. The operator holds the handles and pushes against the concave segment of the driving bar. The roller follows the plow.

Claim.—First, the arrangement of the beams *A*, the wheel *B*, roller *G*, and shank *H*, provided with the brace *J* and point *I*, as and for the purpose set forth.

Second, the hinged brace *E*, in combination with the standard *C* and beams *A*, as and for the purpose specified.

64,772.—SOLOMON KEPNER, Pottstown, Pa.—*Device for Cleaning Stables.*—May 14, 1867.—The fork is forced under the manure and secured by the rod and hooks. The horse is attached to the ring in front.

Claim.—The fork *A* and hooks *B B*, and combination of fork and hooks, for the purpose herein set forth.

64,773.—K. P. KIDDER, Burlington, Vt.—*Beehive.*—May 14, 1867.—The comb frames within the lower hive have their top bars fluted beneath. The slotted pendants have strips attached to their lower ends. The drone trap attached in front of the entrance has openings admitting all the bees but allowing escape to workers only.

Claim.—First, the arrangement of the frames having bars constructed as described, with the support slotted as described, and with the bottom strips *e e* substantially as herein set forth.

Second, the box or trap *G*, in combination with the tube or passage *H* and body *A*, whereby the drones are allowed to pass out, but not to return to the hive, and are caught and separated from the worker bee, so that they may be destroyed, substantially as set forth.

64,774.—J. A. KISSELL and N. BLICKENSUFFER, Chicago, Ill.—*Lightning Conductor.*—May 14, 1867.—A flattened bar with solid ribs.

Claim.—A lightning conductor, consisting of a strip of copper, having the ribs *a* formed solid therewith, as herein shown and described.

64,775.—J. P. THEODORE LANG, Washington, D. C.—*Steam-engine Governor.*—May 14, 1867.—The arm guides are curved tangentially upward, sufficiently to impinge upon one part of the ball arms in all positions, and this part has an anti-friction roller. The steam passes through the vertical slots of an upright cylinder, and a sleeve slides on the cylinder to regulate the passage of steam. The cylinder and sleeve are within a steam drum, and a sleeve is adjustably connected to a lever passing through a stuffing box and actuated by the governor.

Claim.—First, the combination and arrangement of the curved slotted guides H H, collar h, arms d, friction rollers d', springs f f, weights E E, collar F, friction rollers g g, loose collar d, rods i, collar k, constructed, arranged, and operating in the manner substantially as shown and described and for the purpose set forth.

Second, the combination of the valve M and cover L with the governor, substantially as set forth.

64,776.—W. H. LAUBACH, Philadelphia, Pa.—*Apparatus for Carbureting Gas.*—May 14, 1867.—The gas enters the central part of a curved passage formed by a volute-shaped plate within a chamber containing hydrocarbon. The gas passes through a cylinder whose upper end has a hole closed by a valve attached to the float; when the float is raised to a certain height the valve closes to stop the flow of gas.

Claim.—First, the carbureting vessel B, in combination with the regulator A, substantially as described.

Second, the combination of regulator A, and hydrocarbon vessel B, substantially as described.

64,777.—JAMES B. LYONS, Litchfield, Conn.—*Apparatus for making Peat Charcoal.*—May 14, 1867.—The cast-iron retort revolves on anti-friction rollers at the ends of the furnace. A pipe extends axially from the retort to the fire box of the furnace and discharges the combustible gases into said fire box to assist in heating the retort.

Claim.—First, a revolving cylinder, constructed and arranged as herein described, for making charcoal or coke directly from the crude or bog peat, substantially as herein set forth.

Second, constructing a furnace with cast-iron ends and a fire box, in and over which is a revolving cylinder made of boiler iron, fitted and supported on friction rollers, to enable it to be easily turned to change the position of the material.

Third, the pipe h, as arranged for conducting the gas from the cylinder A into the fire box C, to supply feed for operating, substantially as and for the purposes specified.

Fourth, the flanged heads a a, with semicircular openings b and sliding covers c, in combination with revolving cylinder R, friction rollers e e, and fire box C, as constructed for converting crude peat into charcoal and coke, substantially as described.

Fifth, the gas pipe h', the bulk or vessel m, stop cock n, in combination with the furnace C and cylinder A, all arranged and operating substantially in the manner as and for the purposes herein set forth.

Sixth, the mode of constructing the double arches supporting the brick on ribbed curved bars so as to leave a longitudinal flue the whole length of the furnace, for saving the heat from the flame generated from the gas in the cylinder, as set forth.

64,778.—JOHN MARSHALL, Fond du Lac, Wis.—*Brick Machine.*—May 14, 1867.—The fixed molds are covered by a wedge-shaped sliding piece when the plungers are in operation. The plungers are raised to compress the bricks by toggle levers, and after the removal of the cover, which is started by a claw lever, the bricks are raised from the molds by a direct-acting lever.

Claim.—First, in combination with the mold the wedge-shaped cover working in corresponding wedge-shaped grooves, in order to bind the cover home to the mold during the pressing, then to facilitate the removal of the cover, substantially as set forth.

Second, in combination with the lever b and the follower, the swinging fulcrum I, for preventing the side strain and consequent binding of the follower, substantially as described.

Third, the follower D, working in the mold, in combination with the sliding cover S, and operated by

the knuckle-joint lever F G, operated substantially as shown and described.

Fourth, The lever R, provided with the hook F for releasing the cover S, substantially as set forth.

64,779.—W. W. MANGHLIN, Baltimore, Md.—*Machine for Making Door and Window Frames.*—May 14, 1867.—Rotary cutters for cutting the grooves in framings for windows and doors are combined with saws for joggng or tenoning and mitering said frames.

Claim.—First, the saw table B, provided with the adjustable gauge, as described, in combination with the circular saw b, and one or more grooving cutters, constructed, arranged, and operating substantially as and for the purpose set forth.

Second, the miter stand or table, provided with the adjustable gauge F, in combination with the vertically adjustable miter saw b', arranged and operating as set forth.

64,780.—EDWARD MAYER, Philadelphia, Pa.—*Boot and Shoe.*—May 14, 1867.—The edge of the insole is skived off and turned up with the "upper," and a narrow strip of leather is laid around over the junction between the "upper" and the outer sole and through-stitched to both.

Claim.—Extending the side and front edges of the insole of a boot or shoe upward around the inner side of the upper, substantially as and for the purpose described.

Also, the application of the band F over the joint formed between and by the upper and the outside sole of a boot or shoe, substantially as and for the purpose described.

64,781.—GEORGE MCALLISTER, San Francisco, Cal., assignor to himself and CHARLES B. WHITE, same place.—*Low-water Indicator.*—May 14, 1867.—The hollow steam-tight case has a central hub and a sector space, occupied by the arm of a float, which rises and falls with the changes of level of the water in the boiler. An indicator on the same axis moves with the float.

Claim.—A water gauge, composed of the float f, arm d, parts or case A B and C, and passages D D, constructed substantially as and for the purpose described.

64,782.—G. B. McDONALD, New Albany, Ind., assignor to J. BRAGDON & Co.—*Making Buckles.*—May 14, 1867.—Applicable to cotton-bale ties. The plate has two longitudinal ridges, which in use are put to the under side.

Claim.—Making buckles by first rolling the metal bar to the shape represented in Fig. 2, and afterward dividing and punching the same, all as described.

64,783.—JOSHUA MERRILL, Boston, Mass.—*Metal Beam.*—May 14, 1867.—The water contained in the beam is vaporized by fire to assist in extinguishing the same.

Claim.—The hollow metal beam, made water-tight and suitable to contain a body of water within it, and provided with suitable apertures for the introduction of water, substantially as hereinbefore described and substantially for the purpose hereinbefore set forth.

Also, in combination with said hollow metal beam, constructed with suitable apertures for the introduction of water and the escape of steam, a body of water contained within said beam, substantially as described for the purposes set forth.

64,784.—ABRAHAM MICHELbacher, New York, N. Y.—*Peat-gathering Machine.*—May 14, 1867.—The peat is raised by the scraper, and thrown by the revolving buckets into the receptacle. The bucket shaft has gear connection to a ground wheel.

Claim.—First, the combination of the scraper F, the rotating buckets E and the receptacle C, with a suitable carriage, substantially as and for the purpose specified.

Second, the scraper F, pivoted in rear of the rotating buckets E, and furnished with handles n, whereby the said scraper may be made to operate at a greater or less depth, substantially as herein set forth.

Third, the receptacle C, suspended on pivots in

front of the rotating buckets E, and constructed with an end board F, hinged at its upper edge, substantially as and for the purpose specified.

64,785.—WILLIAM MILLER, Cincinnati, Ohio.—*Hoisting Machine.*—May 14, 1867.—The hoisting rope is attached to a bar, which vertically traverses the head bar of the platform, and is attached to the middle of a spring whose ends rest against the under side of the bar. The breaking of the rope relieves the spring, which draws down the bar, and drives out two sliding catch-bolts to which it is connected, and which engage ratchets on the slide bars of the platform. Two spring catches above the upper floor, arrest the descent of the platform, when the rope is broken by failure to stop the platform at the extreme point of elevation.

Claim.—First, the combination of rod H, levers P and pawls N N, jointed substantially as described, with the racks O O and a spring L, substantially as and for the purpose set forth.

Second, the catches S S and spring X X, or their equivalents, for the purpose of affording an automatic stop for the platform, (to which they are not attached when the safety apparatus fails to act,) as described.

64,786.—W. H. and G. W. MILLER, West Meriden, Conn.—*Breech-loading Fire-arm.*—May 14, 1867.—The devices refer to the mode of constructing the breech piece, vibrating it in locking and unlocking and securing it to the end face of the chamber of the barrel.

Claim.—First, the construction of the breech piece with the central elongated slot, combined with the cross head and mortise in the case, for the purposes and operating in the manner described.

Second, the combination of the breech piece cylinder pinion D, and cylinder E, toothed and geared together and operating in the manner and for the purposes described, by means of the lever or arm F.

Third, the combination of the elongated slot with the mortise or recess in the shell of the case, whereby the exact amount of upward and downward movement of the breech piece is regulated by the length of the slot, so that the cross head is brought home in the mortise or lifted out at the instant required.

64,787.—C. H. MITCHELL, Bristow Station, Ky.—*Medical Compound.*—May 14, 1867.—For cure of dysentery: Extract of hyoscyamus niger, 4 grains; camphor, $\frac{1}{2}$ grain; sulphate morphia, $\frac{1}{2}$ grain; essence cinnamon, 5 drops.

Claim.—The compound made of the aforesaid remedies for curing disease as specified.

64,788.—GEORGE MOSMAN, Chicopee, Mass.—*Carpet Stretcher.*—May 14, 1867.—The spring jaws hold the carpet tack.

Claim.—The spring-holding jaws *d d*, formed in one piece of metal, in combination with the plate *k*, substantially as and for the purpose described.

64,789.—JOSIAH OADHOUTD, St. Anthony's Falls, Minn.—*Corn Harvester.*—May 14, 1867.—The reel presents the standing stalks to the cutters and throws them after cutting on the pivoted bars, the oblique bars serving as guides. The pivoted bars are periodically tilted to discharge the stalks in heaps.

Claim.—The frame A, with its oblique guides G G, reel F*, constructed as set forth, cutters E E attached to the bars D D, each side of the thiills C C, and the pivoted arms *g g g*, for dropping the corn, when constructed, arranged and operating in the manner substantially as and for the purpose herein specified.

64,790.—NELSON PALMER, Auburn, N. Y., assignor to himself, SIDNEY W. PALMER, and J. FOREMAN PALMER, same place.—*Bench Plane.*—May 14, 1867.—The throat through which the bit projects is of variable size as required by the pitch of the bit.

Claim.—First, the combination with the movable section or plate for adjusting the size of the throat of a recessed bed and frame formed in the plane stock in front of the bit and parallel to the face of the plane, so as to enclose the said section on three sides and form the ways in which it slides for purposes of adjustment, substantially as shown and set forth.

Second, the bed for supporting the heel of the bit

formed of lead or other suitable plastic material as specified, run between the said heel and the back of the throat so as to form an accurately fitting and solid bed for bit close to its cutting edge, substantially as herein set forth.

Third, the method of and means herein described for adjusting the bit longitudinally so that it shall project more or less from the face of the plane, that is to say, connecting the bit with an eccentric mound in the bed of the bit, the eccentric being operated substantially as herein shown and set forth.

Fourth, the mechanism for maintaining the parallelism of the edge of the bit with the face of the plane, the same consisting of the combination with the bit and bed in which it is supported of a bar capable of sliding laterally in the bed as described, and connected with the bit under such an arrangement that it shall cause the edge of the bit to be tilted or inclined toward one side or the other, substantially as set forth.

Fifth, the combination of the transverse sliding bar provided with jaws and projecting arm or spur as described, with a cam or spiral grooved shaft and actuating lever or equivalent means, substantially as herein shown and set forth.

Sixth, the combination with the tilting or movable bed and bit which it supports of the toggle-jointed and reversible lever and holding pins in the side of the stock, substantially as herein shown and described.

Seventh, the combination with the movable bed and toggle-jointed lever of an adjustable bearing for the said lever, substantially as set forth and described.

Eighth, the adjustable cap herein described, the same consisting of an upper and a lower plate or section connected by an eccentric rod or disk whereby the lower section may be adjusted in its proper relation to the cutting edge of the bit, substantially as shown and described.

Ninth, the combination with the movable section for adjusting the size of the throat, of the knob for securing the same, under the arrangement herein described, so that the said knob shall not only serve to adjust and hold the said section in place, but shall also be a handle for giving the movement of the plane, substantially as set forth.

64,791.—D. J. POWERS and H. B. STEVENS, Madison, Wis., assignors by mesne assignments to BUFFALO AGRICULTURAL MACHINE WORKS.—*Horse Power.*—May 14, 1867.—The cogs of the master-wheel gear into two pinions on shafts whose inner pinions mesh into the cogs of a loose inner wheel. One of the shafts is continued beyond the frame for the attachment of the tumbling rod. The flanges on the wheels form gauges of depth in meshing.

Claim.—First, the driver's platform D, when resting on a central fixed pivot C, substantially as and for the purpose herein specified.

Second, the transferring shaft and wheel G and H, turning around the central pivot C, for the purpose specified.

Third, the flanges *m* and *p p*, respectively on the master-wheel B, and pinions *f g*, substantially as and for the purpose herein set forth.

Fourth, the combination and arrangement of the master-wheel B, fixed pivot C, driver's platform D, and transferring shaft and wheel G and H, as herein described.

64,792.—ARTHUR PRENTISS, Prentiss Vale, Pa.—*Hoe.*—May 14, 1867.—The blank for the braced hoe is cut out of steel plate in a shape to waste no material.

Claim.—As a new article of manufacture, a hoe for garden or other use, cut, formed, and otherwise constructed as described and shown.

64,793.—ARTHUR PRENTISS, Prentiss Vale, Pa.—*Inhaler.*—May 14, 1867.—Grooves are formed in the stoppers so that when partially drawn the air may find vent; when a larger amount is required the stopper may be wholly withdrawn. The sponge is inserted while dry.

Claim.—An inhaler, when formed and its various parts arranged, substantially as described and for the purposes set forth.

64,794.—ARTHUR PRENTISS, Prentiss Vale, Pa.—*Carriage Wheel.*—May 14, 1867.—The spokes enter

sockets between which and an under plate the curved metallic felloe plate is clamped. The edges of this plate enter grooves in the tire which may be covered with an outer one.

Claim.—The wheel rim or felloe when swaged or otherwise formed into suitable shape of sheet metal, either in one or many pieces in combination with the grooved tire B, either when this grooved tire B is made the principal tire or used in connection with the supplemental one, as shown in Fig. 1.

64,795.—ARTHUR PRENTISS, Otto, Pa.—*Carriage Wheel.*—May 14, 1867.—The spokes enter sockets, and the felloe ends half sockets of a metallic piece. The felloe ends abut against plates.

Claim.—First, the combination and use of the socket A, when provided with the small socket E and the flange B, all in one piece, with the pin or screw *i*, and the felly and spoke of a wheel, substantially as described and for the purposes set forth.

Second, the spoke socket and joint clasp composed of the socket A, flange B, extended sides C C, and connecting plate D, all of one piece of malleable iron or its equivalent, for the purpose shown.

64,796.—JOHN RADDIN, LYNN, Mass.—*Car Wheel.*—May 14, 1867.—Between the metallic hub and the web, or the ring in which the inner ends of the spokes terminate, is a cushion of rubber to confer resiliency upon the wheel and lessen the effect of shocks.

Claim.—Arranging the elastic rubber ring or cushion so as to operate within a space as described, formed between the hub and the web, or its equivalent, and side flanges of a wheel.

64,797.—ADAM R. REESE, Phillipsburg, N. J.—*Harvester.*—May 14, 1867.—The toothed shaft in front of the platform turns up as the platform moves back to raise the lodged grain. The toothed cut-off is hinged to the reel shaft and adjusted automatically. Two fingers are pivoted to the outer slot of the platform, and when the latter moves back they are thrown into an upright position by a stop upon the track clearer, to keep the grain from scattering. The automatic discharging platform moves at intervals adjustable by the operator.

Claim.—First, the fingers *h* pivoted to the bar *b*, operating in combination with the clearer S, substantially as and for the purpose specified.

Second, the shaft K, provided with fingers *d*, and arranged to operate in connection with the grain platform, substantially as and for the purposes specified.

Third, the grain supporting bar T, provided with the oblique teeth *t*, and raised and lowered automatically from the grain platform, substantially as and for the purpose set forth.

Fourth, in combination with a harvesting machine an automatic gavel regulator, so constructed that it can be set so as to make the gavels at such different regular distances apart as desired, substantially as set forth.

64,798.—MARTIN C. REMINGTON, Auburn, N. Y.—*Barley Fork.*—May 14, 1867.—The tines and handle are attached to the metallic socket head, which is braced by a wire bow secured to the handle.

Claim.—The metallic head A as constructed with its arch D, and raised socket E to receive a straight handle in combination with a bail or bow B, and brace G, operating in the manner as and for the purposes herein set forth.

64,799.—STEPHEN R. ROSCOE, Obion county, Tenn.—*Sofa Bedstead.*—May 14, 1867.—When the upper seat of the double-seated spring sofa is turned back it revolves in its own frame, furnishing a spring cushioned surface for a bed.

Claim.—The revolving lower cushion or seat of the sofa secured in its position, as described in combination with the movable position of the frame passing out of the way and beneath the cushions or seats, as herein substantially described.

64,800.—JOSEPH MARIE RYO CATELEAU, Paris, France.—*Spindle for Spinning Machines.*—May 14, 1867.—A pin of a sleeve upon the spindle traverses a longitudinal groove of the spindle. This sleeve has vertical reciprocating movement by a pivoted lever whose free end is raised by a rotating heart-shaped

cam, from which it may be disconnected by a hand lever. The pin mentioned traverses a helicoidal groove in a sleeve connected to the motive pulley. When the vertical movement takes place, the flyer, which is connected to the sleeve, will have independent motion in relation to the spindle to wind the yarn on the bobbin.

Claim.—First, the method of effecting the automatic retardment of the rotation of the spindle which carries the bobbin, substantially as shown and set forth.

Second, the combination with the spindle which carries the bobbin of the reciprocating tube, and helicoidal inclined planes under such an arrangement that the reciprocating movement of the said tube shall effect the automatic retarding of the rotation of the bobbins, substantially as herein shown and described.

64,801.—JOHN F. W. SCHULTZ, Moline, Ill.—*Wagon Brake.*—May 14, 1867.—The brakes are simultaneously pressed against all the wheels, the levers being operated in conjunction with the chain and pulleys attached to both axles.

Claim.—The arrangement and combination of the levers D C P, bar G, rod T, lever H, when the whole is operated in connection with pulleys I J, and chain H, substantially as set forth.

64,802.—GEORGE W. SIZER, Springfield, Wis.—*Gate.*—May 14, 1867.—The gate is attached directly to the post, and the scarfs cut to correspond with the string of the gate so that the bars may pass each other in folding.

Claim.—Attaching the rear ends of the gate bars B B B and B' directly to the part A, with no other frame work, and connecting them at the front ends by cross-bar *b*, and in combination with slotted part A', the whole constructed substantially as described and operating as and for the purpose set forth.

64,803.—WILLIAM E. SKINNER, Milford, Mich.—*Butter Worker.*—May 14, 1867.—The compound motion of the paddle, the rotary motion of the butter bowl, and the adjustable sides of the butter box facilitate the separation of the buttermilk.

Claim.—Giving the paddle of the butter worker a compound motion in imitation of the motion given to the paddle by a dairy woman, substantially as set forth by the devices described, or their equivalents.

Also, in combination with the paddle having the compound motion above claimed, giving the butter bowl a rotary motion, substantially as described.

Also, in combination with the butter worker, the press box with movable sides hinged to its base, substantially as described.

Also, in combination with the press box above claimed, the traversing follower, substantially as described.

64,804.—GEORGE SMITH, Providence, R. I.—*Lamp Burner.*—May 14, 1867.—The ignition holes of the burner are closed by a spring slide after being used.

Claim.—First, the application of a spring to the slide or valve *h* which is used for closing the opening through a lamp burner, substantially as described.

Second, the relative arrangement of the laterally movable spring slide *a* with respect to the wick spur button D, substantially as described.

64,805.—C. SPARKS, DOWNERS GROVE, Ill.—*Compound for Welding Steel.*—May 14, 1867.—Composed of coppers, 2 oz.; salt-peter, 1 oz.; sal-ammoniac, $\frac{1}{2}$ oz.; salt, 6 oz.; sul soda, 2 oz.; sand, 3 lbs.; wood ashes, 1 lb. To be well pulverized and used as a flux.

Claim.—The above described compound for welding steel.

64,806.—SOLOMON STEVENS, New Carlisle, Ind.—*Beehive.*—May 14, 1867.—The comb frames are removable out of the hive without disturbing the honey boxes.

Claim.—First, the grooved strips *d d* in combination with the comb frames *e e*, substantially as arranged for the purpose and in the manner specified.

Also, the box *f* and tube *g*, combined, arranged, and operating in the manner and for the purpose set forth.

64,807.—OTTO STIETZ, New York, N. Y.—*Making Glass Letters, Numbers, &c.*—May 14, 1867.—The apparent relief to the gilt face of the letters on the plain surface of the glass is accomplished by etching in the face of the letter on the reverse side of the glass, and allowing the metallic leaf laid thereon to overlap.

Claim.—A letter formed upon the reverse side of a piece of glass by means of etching in the face of the letter and covering it with a surface of metal or foiling, lapping upon the unetched portion, thereby producing an appearance of relief, substantially as described.

64,808.—HORATIO N. TAFT, Sag Harbor, N. Y.—*Door Fastener.*—May 14, 1867.—The pointed catch fastens between the door and the jamb, and has a slot by which the bolted door-holding plate is attached.

Claim.—A combination portable door fastener, constructed, combined, and operating substantially as herein shown and described.

64,809.—JOHN H. TEAHL, Eberly's Mills, Pa.—*Bush for Spindles for Grinding Mills.*—May 14, 1867.—The frustal, inverted, pyramidal bush-block has a funnel-shaped opening through which the spindle passes, surrounded by frustal, conoidal anti-friction rollers, whose journals enter slots in triangular top and bottom plates which are connected together.

Claim.—The above-described mill bush, consisting of the funnel-shaped metal box D, having conical friction rollers revolving therein and carrying the spindle within the frame that holds the rollers, when constructed and operating substantially as described.

64,810.—D. D. TEMPLETON, New York, N. Y.—*Garbage Box.*—May 14, 1867.—The box is to be set below the level of the pavement. The lid opens in two directions, but is not detachable, and the upper portion forms a stepping block, &c.

Claim.—First, the lid A, constructed substantially as described.

Second, the angular groove E, in combination with the box W and lid A, substantially as described.

Third, the trap door L, in combination with the box K, communicating with the cellar and supporting the receptacles B, substantially as represented and described.

Fourth, the combination of the garbage and ash box, substantially as described.

64,811.—E. S. TORREY, New York, N. Y.—*Weather Strip.*—May 14, 1867.—The weather strip is made of hard and soft rubber, the latter strip being inserted in and cemented to the former.

Claim.—The combination of the strip of soft India-rubber, or its equivalent, with a strip or molding of hard rubber, or its equivalent, substantially as and for the purposes herein set forth.

64,812.—TIMOTHY TUFTS, Somerville, Mass., assignor to CHARLES C. BEERS and PERSON DAVIS.—*Brick-molding Machine.*—May 14, 1867.—From the pug mill the clay enters a chamber from which it is expelled by a plunger through spouts which extend to the bottoms of the molds; the latter are raised up to receive the clay and descend while being filled. When the molds are filled and in their lower position they are driven out from under the spouts or conveyers and another mold box placed in position.

Claim.—The combination of one or more tubular conveyors C with the expressing chamber B, its plunger E, and mold D, to operate substantially as specified.

Also, the combination and arrangement of the covering plate K with the carriage H, one or more tubular conveyors C, the expressing chamber and its plunger, the whole being provided with mechanism for operating them, substantially as specified.

Also, the combination of the mold-lifting and depressing mechanisms with one or more tubular conveyors C, the expressing chamber, and its plunger, to operate with the mold, as specified.

Also, the combination of the mold operative carriage H with one or more tubular conveyors C, the expressing chamber B, and its plunger applied to the mixing reservoir and provided with mechanism for operating them, substantially as specified.

Also, the combination of the scraper S with one or

more conveyors C, the expressing chamber B, and its plunger E, to operate with the mold, substantially as set forth.

64,813.—LEONHARDT UITTING, Philadelphia, Pa., assignor to C. LIEBRICH, same place.—*Trunk Lock.*—May 14, 1867.—The spring bolt and tumblers are constructed and operated so that a self-fastening catch and a lock bolt are combined.

Claim.—The spring bolt E and tumbler I, or its equivalent, constructed and operating substantially as described, so that a self-fastening device and an ordinary locking bolt operated by a key may be combined in one lock.

64,814.—C. PH. WAGNER, New York, N. Y.—*Cotton and Hay Press.*—May 14, 1867.—The follower is connected by rods to the radial arms of the segments, which are actuated by a vertical screw. The screw is geared to a shaft, which is clutched to rotate it in either direction.

Claim.—First, the combination of the vertical screw C with the segments D D, provided with radial arms E pivoted by double toggle joints F F' to opposite sides or ends of the platen, operating so as to give to it a variable velocity and action, substantially as specified.

Second, the side braces M fitting into shoes o at their base, and gearing with open hook ends of a cross-bar L to the lower, the baling box at top, essentially as shown and described.

64,815.—M. J. WELLMAN, New York, N. Y.—*Shield for Protecting Water Backs in Ranges and Stoves.*—May 14, 1867.—A movable metallic shield is interposed between the fire and water back and adjusted to shut off heat from the latter.

Claim.—The metallic plate between the water back and the fire and forming the back of the fireplace and protecting the water back at all times, so constructed and arranged as to rest against the water back when the water back is to be heated, and to be moved forward and permit a current of air to pass up between the said water back and the fire when the heat of the fire is to be excluded therefrom, as and for the purposes herein set forth.

64,816.—NORMAN W. WHEELER, Brooklyn, N. Y.—*Ventilating Skylight.*—May 14, 1867.—The frame bolted to the desk has lights of heavy corrugated glass fitted in rubber packing. The hood ventilator occupies the center of the roof and is turned from above or below by a rod attached thereto. A drip pan is secured to the rod to collect rain or spray that may be driven into the hood, which is carried from thence by vent pipes to the deck.

Claim.—First, the combination of the hood a, frame B B, and glasses E E E, or their equivalents, as set forth.

Second, the combination of the hood a, pan pipes i i j j, and frame B B, or their equivalents, substantially as set forth.

Third, the combination of the trunk r and glasses S S S with the above, substantially as set forth.

Fourth, the combination of the pipes o o o o and lighted frame B B, or their equivalents, substantially as set forth.

64,817.—HENRY WHITALL, Woodbury, N. J.—*Machine for Grinding the Cutters of Harvesters.*—May 14, 1867.—The frame has a winch and grinding disk, and is adjustable to bring the latter in contact with the cutters and to give the necessary feed to the same.

Claim.—First, a portable machine adapted to grind the cutters of mowing and reaping machines, when arranged and operating in the manner substantially as described.

Second, in combination with a machine constructed substantially as described, the clamp P, when arranged for joint action with the said machine, as and for the purpose described.

64,818.—WILLIAM N. WHITELEY, Jr., Springfield, Ohio.—*Harvester.*—May 14, 1867.—The coupling arm is actuated by a lever to raise or lower the frame in relation to the bearing wheels. The frame has a backwardly projecting tubular stud, on which the coupling arm of the cutter is mounted and through

which passes the crank shaft of the actuating cutter. This coupling arm is adjustable by a screw and screw gear wheel to regulate the cutter bar. The coupling arm is held on the stud by a projecting catch attached to the frame and taking over a flange upon the arm.

Claim.—First, the coupling arm J, in combination with the circular plate H, substantially as and for the purpose set forth.

Second, the coupling arm J, constructed to clasp the sector plate H at three points, so as not to depend upon the pinion shaft for its center of motion.

Third, the coupling arm M, mounted and moving upon the horizontal axle stud K, through which passes the cutter's crank shaft, substantially as and for the purpose set forth.

Fourth, the hook U, in combination with the flange V on the hub of M, substantially as and for the purpose set forth.

64,819.—WILLIAM N. WHITELEY, Jr., Springfield, Ohio.—*Harvester Rake.*—May 14, 1867.—The cutting apparatus is hinged to the frame. The drag bar, through the cutting apparatus is attached, is made hollow so that the reel-driving shaft may pass through it. The rake may be thrown out of gear when not on the platform.

Claim.—First, in combination with a harvesting machine, having two adjustable wheels, a hinged cutting apparatus and a raking and reeling mechanism mounted on the inner end of said cutting apparatus, rotating about a vertical shaft F and counter shaft D, with their bevel gear connections, for the purpose of driving the said reel and rake by a train of gearings from the main pinion shaft, and so that the movements of the reel and rake may at all times conform to the position of the finger bar, substantially as set forth.

Second, in combination with a harvesting machine having two wheels and a hinged cutting apparatus, the tubular drag bar I, rigidly secured to the frame of the machine and forming the center upon which the cutting apparatus vibrates, so that the axis of the reel and rake's driving shaft may be coincident with the axis upon which the cutting apparatus vibrates, substantially as set forth.

Third, the collar T, provided with the notch Q, in combination with the stop plate E' and clutch lever A', substantially as and for the purpose set forth.

Fourth, the clutch lever A', in combination with connecting rod B' and head lever C, constructed and arranged as set forth.

64,820.—JOHN G. WILKINSON, Quincy, Ohio.—*Vehicle.*—May 14, 1867.—The lever extends above the bed of the vehicle and is operated by the occupant, the alternating motion of the lever causing the rocking of the shaft which actuates the rear axle, inducing the forward motion of the wagon. The rods alternate with each other, causing a continuous action of the axle.

Claim.—First, the arrangement of the rocker shaft F with its divided lever H, rods G G and crank axle B with the frame D, in the manner substantially as and for the purposes herein specified.

Second, the rocker shaft F, when constructed in the manner as herein set forth.

64,821.—JOSEPH P. WOODBURY, Boston, Mass.—*Locomotive Truck and Engine.*—May 14, 1867.—Each truck is free to swivel and vibrate independently of the other and of the main carriage. A separate pair of vertical cylinders and gears is attached to each truck, and swivels with the truck of the main carriage and the horizontal boiler. The latter has a steam dome at each end connecting by pipes with the respective cylinders. Each wheel is a driver and is able to adjust itself to the irregularities of the track, enabling the locomotive to traverse curves of short radius.

Claim.—First, a locomotive engine constructed with horizontal boiler resting entirely on trucks, which have free lateral oscillation independently of the boiler, these trucks being provided with vertical frames, as shown and described for the purpose set forth.

Second, the vertically-acting cylinders, in combination with a frame which oscillates rotatively with the truck independently of the boiler.

Third, the combination and arrangement of the pipes J, the pipe F, exhaust pipe Y, cap P, and pipes H.

Fourth, the combination of the circular series of radial rollers *a* with the concentric rings as shown in Fig. 5, holding the axes of the same and the horizontal boiler and truck.

Fifth, the combination of the operating rod *z*, toggle joint U and reverse handle N, as shown in Figs. 1 and 3.

Sixth, the combination and arrangement of the arms *f f*, the journal boxes *g g* of the driving wheels and journal box S, as shown in Fig. 8.

Seventh, the rod *x* with swivel connections, in combination with the throttle 7 of the forward engine.

Eighth, the swivel plate or yoke *p p*, in combination with the engine frame and steam dome.

Ninth, the combination as well as the arrangement of the pipe F and its adjunct with the dome D, as shown in Fig. 9.

64,822.—S. SAYRE WOODRUFF, Brooklyn, N. Y.—*Baby Carriage.*—May 14, 1867.—The tongue is pivoted near the rear axle and projects forward or backward to enable the attendant to pull or push the vehicle.

Claim.—First, the combination of the pivoted reversible tongue or shafts with the body of the carriage, substantially as herein set forth for the purpose specified.

Second, the combination of the pivoted reversible tongue or shafts, constructed with elastic sides as set forth, with the ears or stops *d* and *e*, formed upon the body of the carriage, substantially as and for the purpose specified.

64,823.—JOSEPH B. WORSHAM, Hibernia, Mo.—*Tobacco Belting Knife.*—May 14, 1867.—Two handles connected by a spring bow have a pair of parallel recessed knives on each jaw with connecting transverse knives. The stalk is grasped below the leaves and the tool oscillated to remove a ring of bark.

Claim.—The belting knife or implement constructed and used substantially as herein shown and described.

64,824.—GEORGE S. YINGLING and SAMUEL F. POORMAN, Tiffin, Ohio.—*Apparatus for Washing and Cooling in Brewing.*—May 14, 1867.—Arms are attached at intervals to the vertical shaft, and shovels at its lower end. The shovels are braced by rods to the upper part of the shaft.

Claim.—First, the use of the adjustable bars D D, provided at their lower ends with the shovels G G, which are used in connection with the shovels G G, as and for the purpose set forth.

Second, the arrangement of the shaft A with its bars B E and D, its rounds C C, and the shovels G and F, the several parts being constructed and used as and for the purpose herein specified.

64,825.—JOHN H. EDWARD, Mendota, Ill.—*Measuring Funnel.*—May 14, 1867.—The pipe of the funnel is closed by the valve. Rising vertically from the valve is the rod with its gauge flanges, which indicate quantity.

Claim.—The combination of the valve B, rod C, lever E, and slotted handle F, said parts being so constructed and arranged that the lever E, when the valve is closed, shall form a spring, by the tension of which the parts are held firmly in position, substantially as set forth.

64,826.—CHARLES APPLE, Hoboken, N. J.—*Device for Holding Cigars.*—May 21, 1867.—The two semi-cylindrical shells are hinged at one side and are locked by a spring catch.

Claim.—As an improved article of manufacture, a cigar holder, consisting of a combination of the shells A B with the cutter *d*, the latter either being attached to one of the shells or being part of the same, all made and operating substantially as and for the purpose herein shown and described.

64,827.—GEORGE ATKINS, Sharon, Pa.—*Line Kilm.*—May 21, 1867.—The bosh of the kilm is formed in the shape of a truncated cone based on an inverted cone having two tiers of furnaces extending into the body of the kilm. The upper chamber provides room for expansion.

Claim.—The arrangement of the linekilm formed of the chambers A B D, and heated by furnaces C C,

at different levels inside the kiln, operating substantially as and for the purpose herein described.

64,828.—GEORGE H. AYLWORTH, Brighton, Ill.—*Hay Press.*—May 21, 1867.—The follower has side projections which pass through the slots in the box, and have nuts engaged by screws whose actuating pinions are turned by a common wheel.

Claim.—A hay press, consisting of a box *a*, and the sliding partition *k*, operated by means of the screws *c b*, the whole constructed and arranged as herein shown and described.

64,829.—FRANCIS BAKER, New York, N. Y.—*Carriage Window Frame.*—May 21, 1867.—The window is pivoted to side bars whose lower ends are pivoted to blocks which slide in grooves within the casing.

Claim.—A carriage window frame swiveled or pivoted to uprights *F*, arranged to move in and through the carriage body, and bent springs *K* or *L*, hooks or catches *N*, and studs *I*, substantially as and for the purpose described.

64,830.—ROBERT BARCLAY, Buffalo, N. Y.—*Sewing Machine.*—May 21, 1867.—The presser-foot receives oscillation simultaneously with the feed wheel, by a cam acting on a spring dog which connects with the presser-foot, and which is adjustable by a set screw to regulate the feed to agree with the speed of the wheel. The cam is mounted on the end of the needle-actuating shaft, and acts in conjunction with another cam to operate the take-up mechanism.

Claim.—First, the sliding rod *q*, situated between the needle slide and tension device *t*, in combination with the needle-operating shaft *E* and cam *r*, the whole arranged and operating as and for the purpose specified.

Second, the combination and arrangement of the adjustable pivoted dog *m*, slide *o*, and lever *G*, in combination with the presser-foot *D*, constructed and operating substantially as and for the purpose set forth.

64,831.—JOHN A. BASSETT, Salem, Mass.—*Liquid for Carbureting Gases.*—May 21, 1867.—The light hydrocarbons of petroleum are combined with the light hydrocarbons of resin, wood, shale, or peat; nine parts of the former to one of the latter.

Claim.—The hydrocarbon liquid for carbureting gases, produced by the combination and process described substantially in the foregoing specification.

64,832.—ALFRED BRIDGES, Newton, Mass.—*Peat Machine.*—May 21, 1867.—The mold bottom is fixed, and the sides consist of a sleeve raised by a double lever; the plunger is kept in position on its lever by a spring.

Claim.—First, the arrangement of the sleeve *C*, passing over stock *D*, in the manner and for the purpose described herein.

Second, the adjusting plunger *E*, by means of projection *d* and spring *C*, or its equivalent, as above specified.

64,833.—JAMES S. BROTHERS, Duncannon, Pa.—*Railway Switch.*—May 21, 1867.—The rocker shaft is connected to pivoted sections of rails at the place of convergence, and a single centrally pivoted piece at the intersection of the inner rails of the two tracks.

Claim.—The construction of the chair *K*, with the adjustable frog *G*, when arranged, combined, and operated as herein described and for the purpose set forth.

64,834.—SAMUEL C. BRUCE, New York, N. Y.—*Quartz Mill.*—May 21, 1867.—The ore passes from the hopper into the first cylinder, the beaters on the shaft forming a partial vacuum. The beaters strike the ore which is carried by the peripheral force of the current through the connecting passage into the second chamber, through which it receives the same treatment, and passes to the connecting pipe, which deposits it in the dust chamber.

Claim.—First, the revolving wheels *C* and *D*, with velocities varying in some regular ratio, so that wheel *D* shall always revolve faster than, and in the same direction as wheel *C*, and for the purpose described.

Second, the arrangement of wheels *C* and *D*, re-

volving in the same direction, in separate but communicating cases *A* and *B*, and so constructing said cases and arranging them with reference to said wheels and their shafts that the external air can enter at aperture *E*, only in the periphery of the case *A*, substantially as and for the purpose described.

64,835.—BENJAMIN N. BUTCHER, Philadelphia, Pa.—*Saw Set.*—May 21, 1867.—The metallic bed piece is attached to the wooden block. The edges of the top face are bearded at different angles to adjust the set. The guides are attached and adjusted to the bed piece by screws. The saw is clamped by set screws passing through one of the guide pieces. The rod between the guides carries the sets, which lie on the point of the teeth and are struck with a hammer.

Claim.—The combination of the bed plate *A*, with beveled edges of different angles of inclination, and the reversible and adjustable guide pieces *E* and *E'*, set screws *F* and *G*, and sets *C B*, substantially as and for the purpose set forth.

64,836.—JAMES A. CAMPBELL, Stow, Ohio.—*Cane and Sorghum Stripper.*—May 21, 1867.—The top is removed by a rotary cutter and the blades stripped between a fixed lower stripper and a movable one above; the stalk is drawn through between two grooved rollers.

Claim.—First, the rollers *G H*, arranged substantially as shown and described in connection with the stationary cutter or stripper *L*, and the yielding or pressure cutter or stripper *M*, having the lever *N* and spring *O* applied to it, substantially as and for the purpose set forth.

Second, the rotary topping cutter *Q*, attached to wheel *R*, in connection with the coacave plate *S*, all arranged to operate in connection with the stripping device, substantially as shown and described.

Third, the combination of the endless leaf and top-discharging apron *B*, with the leaf-stripping and stalk-topping mechanism, substantially as and for the purpose herein set forth.

64,837.—JAMES F. CAMPBELL and CORNELIUS TINNEY, Williamsburg, N. Y.—*Portable Seat for Drivers upon Cars.*—May 21, 1867.—The supporting rod is hinged to an upright attached by a hook on its upper end to the dashboard; the seat resting on the rod is secured by a perforated strap to a pin on the top of the hooked standards.

Claim.—The upright or staff *B*, with hook at one end, and provided with a rod *E*, having seat *G* and strap *H*, substantially as and for the purpose described.

64,838.—HORACE S. CARLEY, Cambridgeport, Mass.—*Bottle Stopper.*—May 21, 1867.—The stopper is secured to a strip of metal, which slides between ears, secured to the band surrounding the neck of the bottle. The stopper is held in the bottle by a yoke.

Claim.—The slide *F*, carrying stopper, in combination with the swiveled loop *E*, in which it moves, substantially as and for the purpose described.

Also, in combination with the above the swinging clasp *I*, substantially as described for the purpose set forth.

64,839.—ELISHA A. CHACE, Rosemond, Ill.—*Wheel Plow.*—May 21, 1867.—The beam of an ordinary plow is pivoted to the frame, which is hinged to the carriage; the latter carries a driver's seat and plow, and is adjustable by a lever in proximity to the seat.

Claim.—A wheel plow having the stationary frame *A*, pivoted frame *F E' F'*, plow beam *D* and elevating devices *G G' G''*, arranged to operate substantially as and for the purpose described.

64,840.—GEORGE F. CLEMONS, Springfield, Mass.—*Cloth Guide for Sewing Machines.*—May 21, 1867.—The guide plate is attached beneath the lower limb of the elastic sheet metal, whose upper end is attached to a gauge plate, the lower portion resting on the goods, and by its pressure keeping the edge of the latter to the face plate of the gauge.

Claim.—First, in a cloth guide for sewing machines the employment with a cloth gauge of a rigid guide plate, adapted to bear upon the cloth in front of the sewing needle, and extend across the line of seam

being sowed, and having elastic and adjustable pressure given to it, in such a manner as that it shall press more upon the cloth outside the seam than inside thereof, and thereby guide the cloth towards the gauge face.

Second, the elastic plate *b*, either with or without the rigid guide plate *a*, combined with the pressure plate *e*, screw *f* and gauge *c*, substantially as described and for the purposes set forth.

Third, the rigid guide plate *h*, combined with the elastic plate *i*, screws *j j*, rigid plate *k*, and gauge *l*, all with or without the link *n*, substantially as described and for the purposes set forth.

64,841.—NEIL CLIFFORD and A. N. BELL, Brooklyn, N. Y.—*Deodorizer for Privy Seats.*—May 21, 1867.—Explained by the claim.

Claim.—The combination with the seat of a privy, water-closet, or other similar place of whatever name called, of a receptacle or vessel for the reception and holding of any suitable deodorizer or disinfectant, whether in the form of a liquid or powder, when such vessel or receptacle is so constructed and connected with the seat board that by the depression or upward movement of the seat, or both, the said disinfectant or deodorizer will be discharged into the vault of the privy, &c., substantially as and for the purpose described.

64,842.—JOSEPH M. COALE, Baltimore, Md.—*Locomotive Engine.*—May 21, 1867.—The part of the boiler end through which the tubes pass is separated from the smoke chamber by a plate, traversed by tubes, similar to those in the boiler. The chamber within this plate serves to receive the air and heat the same to prevent chilling the tubes.

Claim.—In combination with locomotives and other similar boilers the additional sheet *d* and flues *f*, for the purpose of preventing the cold air from chilling the ends of the flues proper, substantially as and for purpose set forth.

64,843.—JOHN COCHRANE, Wall Township, N. J.—*Railroad Rail Fastening.*—May 21, 1867; ante-dated May 13, 1867.—A cleat plate has claws to enter the tie and prevent splitting, and a groove to receive the edge of the rail base.

Claim.—First, the combination of a screw bolt or wood screw spike with a cleat that has a bearing upon the top and at the edge of the rail flange, and also upon the cross tie, and so constructed or formed that it can be removed from the flange of the rail upon slackening up the screw bolt or wood screw spike by which it is secured to the cross tie, substantially as herein described.

Second, the heel spurs of the cleat for entering into the timber or cross tie, so as to hold against the lateral thrusts upon the rails, as caused by the action of the wheels of passing trains, in combination with the screw bolt or wood-screw spike fastening of such cleat, substantially as herein described.

Third, the peculiar construction of the cleat, by reason of which it may be made by pressure or percussion from flat iron bar complete in all its parts, without necessarily altering the thickness of the material in any of such parts, substantially as herein described.

64,844.—S. M. COLBURN, Ansonia, Conn., assignor to himself and SYLVESTER COLBURN, same place.—*Steam Generator.*—May 21, 1867.—A plate to collect the sediment is placed a short distance above the bottom of the boiler; the spaces above and below communicate around the edges of the plate.

Claim.—The plate *B*, constructed and arranged within the boiler, so as to form a chamber *C*, communicating with the boiler by means of openings or perforations *a*, substantially as and for the purpose set forth.

64,845.—JOSEPH H. CONNELLY, Wheeling, W. Va.—*Manufacture of Gas.*—May 21, 1867.—The object is to dispense with the lime purifier, commonly used, while still producing gas free from sulphuretted hydrogen.

Claim.—First, the use of lime obtained from burnt limestone or oyster shells, damped or slaked with water, salt, or salt-peter solution, introduced into the

retort as described, in the proportion mentioned, for the purpose of whitening and desulphurizing the gas, as set forth.

Second, the use of lime prepared as stated, in combination with coal and residuum oils, introduced as described for the purpose specified.

Third, the combination of lime, prepared as stated, and cinders, coke, coal, or wood, with residuum oil alone, for the purposes mentioned.

Fourth, the use of residuum oil alone, in combination with lime, for the production of inflammable gas, desulphurized and whitened in the manner set forth.

64,846.—ROBERT CREUZBAUR, New York, N. Y.—*Steering Vessels.*—May 21, 1867.—The steering screw rotates within a transverse water way near one end of the hull. It is turned by a steam engine, and by a lever. The shaft extending to the upper deck may be clutched to rotate the screw in either direction.

Claim.—First, in combination with a steering screw, or its equivalent, arranged within a pipe or water way extending transversely through the hull of a vessel, a means which will enable the pilot to give a right or left motion to said screw, or to stop or start it at pleasure without stopping or reversing the motion of the driving power, substantially as described.

Second, the combination of a steering screw or its equivalent, arranged within a water way extending transversely across the hull of a vessel, with a means which will enable the pilot from the pilot-house to stop, start, or reverse the motion of an engine, which is used for rotating said screw, substantially as described.

Third, in combination with a steering screw, arranged to operate substantially as described, the employment of an engine for rotating the screw, and a means for rotating the screw when the engine is in operation, substantially as described.

Fourth, providing for disconnecting the capstan shaft *F* from the screw shaft *d*¹, when this latter shaft is connected to and driven by the engine shaft *d*², substantially as described.

Fifth, the combination of the capstan or capstans upon shaft *F* with the gearing *E f f'*, clutch *g*, lever *G'*, shaft *d'*, and with an extension *d*² of shaft *d*, clutch *W* *W'* and a driving engine, substantially as described.

64,847.—GEORGE W. D'ACUNHA, New York, N. Y.—*Keeper for Door Locks.*—May 21, 1867.—The keeper has a flange to project along the jamb, and another flange to project along the casing. It is cast in one piece.

Claim.—An improved catch or nosing for door locks formed with a flange *d*¹, to project along or be let into the jamb, and with a flange *d*² to project along the casing, said flanges being cast solid with and forming an integral part of the side catch, substantially as herein shown and described and for the purpose set forth.

64,848.—LEOPOLD DELACE, Springfield, Ill.—*Hay Loader.*—May 21, 1867.—The machine is attached by a chain to the side of a wagon. The platform revolves, the sets of teeth rake and discharge the hay and act as receivers alternately. The fork has a continuous movement.

Claim.—First, the revolving platform and raking device *D*, composed of the frame *a*, fitted in the main frame *A* and provided with the bars *E*, having teeth *F* attached, all arranged substantially as and for the purpose specified.

Second, the raking and pitching fork *S* attached to a carriage *P*, operated by an endless chain *Q* and arranged with ways or guides *j j*, on a suitable framing or support, substantially as and for the purpose set forth.

Third, the swinging or pendant frame *T* in combination with the lever *I*, bar *H*, and clutch pulley *G*, arranged to operate in connection with the revolving platform and raking device substantially as and for the purpose specified.

Fourth, the two pulleys *G G'* connected by a clutch, and arranged as shown to operate respectively the revolving platform and raking device, and the raking and pitching fork substantially as shown and described.

64,849.—WILLIAM H. DOANE, GERRITT V. ORTON, and WILLIAM E. LONDON, Cincinnati, Ohio, assignors to J. A. FAY & Co.—*Planing Machine.*—May 21, 1867.—The cutters are held in grooves in collars sliding on the rectangular part of the spindle, the set screws traversing slots and engaging the spindle. The cutters have break irons similar to those of a hand plane. An adjustable guard covers the spindle head.

Claim.—The combination of the adjustable break irons *k' k'* with the cutters *k k*, and the removable collars *h h*, all constructed and arranged in the manner and for the purpose described.

Second, the application of the shield *G* to a post *m*, which is allowed to revolve around the cutter head substantially as described.

Third, sustaining the safety shield *G* upon the table to *A*, by means which will admit of said shield being moved around the axis of the cutterhead, and also adjusted vertically substantially as described.

64,850.—JAMES W. DREW, Stockbridge, Mich., assignor to himself and JOSEPH N. TOWNSON.—*Wheel Vehicle.*—May 31, 1867; antedated May 16, 1867.—The axles rotate with the wheels and butt against friction wheels. The crooked sway bar attached to the tongue is braced by pivoted cross bars hinged to the front axles, which have guides connecting them with the rear axles.

Claim.—The crooked sway bar *H* and the cross bars *I* and *J*, in combination with the axle *C C* and the axle guides *G G*, the whole constructed and operating in the manner and for the purpose herein described.

64,851.—CHARLES M. ALBURGER, Philadelphia, Pa., assignor to GEORGE R. KIRK, same place.—*Cock.*—May 21, 1867.—The follower has elastic and metallic packing upon its lower end, and a flanged thimble spiral spring and elastic packing near its upper end. The thimble covers the spiral spring to prevent its cutting the packing.

Claim.—The follower *A*, having its metallic packing *E*, and elastic packing *e*, in combination with the spring *D*, flanged thimble *F*, packing *E* and spigot *C*, substantially as described for the purpose specified.

64,852.—JAMES A. EHLE, Green Bush, Wis.—*Converting Rectilinear into Rotary Motion.*—May 21, 1867.—The walking beam receives a reciprocating motion from the engines, operates the sliding carriages and their hooks, which engage with those attached to the corners of triangular or polygonal disks, and rotate the shafts to which the latter are attached.

Claim.—First, converting rectilinear motion into rotary motion by the use of polygons, substantially as described.

Second, the balanced lever *B*, the connecting rods *C C*, the carriages *D* and the guides *E*, substantially as described and for the purposes herein set forth.

Third, the pins *f*, forming hooks upon the triangles *E* and the bar *b*, in combination substantially as shown and described.

Fourth, the cam wheel *L*, in combination with the triangle *E* and the gear wheels *H* and *k*, substantially as herein shown and described.

64,853.—PERRY FENLASON, Cincinnati, Ohio.—*Portable Roofing Boiler and Furnace.*—May 21, 1867.—The furnace, boiler and other incidentals, are mounted on a spring dray for convenient transportation.

Claim.—The boiler *B*, in combination with the spring dray *A*, or its equivalent, constructed substantially as above described and for the purpose set forth.

64,854.—B. L. FETHEROLF, Tamaqua, Pa., assignor to himself and J. M. HADESTY, same place.—*Attachment to Stoves for Generating Gas.*—May 21, 1867.—Petroleum is supplied in graduated quantity to the retort in the stove; the gas generated passes to the reservoir and thence to the burners.

Claim.—The hollow metallic block *A*, fitted within the fire chamber of a stove so as to constitute both a gas generator and a lining or fire brick, substantially as described.

64,855.—P. G. FINN, Erie, Pa.—*Putting Up Oils in Casks, &c.*—May 21, 1867.—Preparatory to being

placed in barrels the oil is heated to 110° Fahrenheit, and is then sealed up.

Claim.—The barreling and hermetically sealing of coal oil in a heated and expanded state, substantially as and for the purpose set forth.

64,856.—DANIEL FOBES, Boston, Mass.; assignor to FOBES, HAYWARD & COMPANY, same place.—*Edible Composition.*—May 21, 1867.—Roasted coffee, tea seeds, and cocoa are ground together and made into a beverage or confection.

Claim.—The edible composition as made of the materials in the manner and for the purpose substantially as described.

64,857.—GEORGE F. FOLSOM, Roxbury, Mass.; assignor to himself and CHARLES F. PEASE, same place.—*Extension Table.*—May 21, 1867.—The main leaves are attached to the frames which are supported on legs, and have folding leaves capable of support by brackets. When the end frames are extended, middle leaves are raised by cams to supply the hiatus.

Claim.—The combination as well as the arrangement of an auxiliary leaf *E*, and mechanism, (viz. its rods *k*, elevators *H*, and their counter cams, or the equivalents thereof,) for operating it as described, with two leg frames, and their main leaves *D D*, one of such leg frames being constructed with a space or recess arranged below the main leaf, and for the reception of the auxiliary leaf when the table is closed as described.

Also, the combination as well as the arrangement of two auxiliary leaves *E E*, and mechanism for operating them as described, with the three frames *A B C*, and their main leaves *D D*, arranged together as specified.

Also, the combination as well as the arrangement of two turning leaves *F F*, two main leaves *D D*, three of the frames *A B C*, as described, two auxiliary leaves *E E*, and mechanism, (viz. its rods *k*, elevators *H*, and their counter cams or the equivalent thereof,) for operating such leaf or leaves *E*, as described.

Also, the peculiar mechanism in combination applied to each turning leaf, and for operating each of the auxiliary leaves, such being the slide rods *k k*, and the elevators and their counter cams, or their equivalents, as set forth.

Also, the combination as well as the arrangement of one turning leaf *F*, two main leaves *D D*, two leg frames, one auxiliary leaf *E*, and mechanism, (viz. its rods *k*, elevators *H*, and their counter cams, or the equivalents thereof,) for operating such leaf, as described.

64,858.—WILLIAM GALLADAY, Shelbygan Falls, Wis.—*Mechanical Movement.*—May 21, 1867.—A longitudinally reciprocating rod operates two pawls, which alternately engage the opposite sides of a ratchet wheel to rotate the same.

Claim.—The combination of the arms *C D* and pawls *E F*, with the ratchet wheel *A*, as and for the purpose set forth.

Also, connecting the arms *C* and *D*, at their inner ends, so as to be operated by one connecting rod, substantially as shown and described.

64,859.—ERNST GESSNER, Auc, Saxony.—*Gig Mill.*—May 21, 1867.—A series of rotating disks with cards act in conjunction with guide rollers, so that the cloth is acted on in every part, to raise a nap.

Claim.—First, the construction and arrangement of the revolving disks *D*, in the adjustable frame *C*, substantially as described, for the purpose specified.

Second, the arms *O O'*, with toothed segments, in combination with the rollers *N'*, and disks *D*, constructed and operating substantially as and for the purpose set forth.

64,860.—ROBERT D. GREEN, Columbia, Mo.—*Gate.*—May 21, 1867.—The bed piece on which the anti-friction rollers work is detached from the posts. Cleaners attached to the bottom bar clear the track for the rollers.

Claim.—The solid bed-sill or track-log laid in the ground, and detached from the gate post, and on which the gate rests, plain on upper surface with groove or rail as denoted by letters *H*, also pin fastener at top of post, as shown by letter *G*; also the

track cleaners, marked D D, fastened to under part of bottom rail of the gate in front of each wheel, and designed, as the gate moves, to remove from track all obstructions to the wheels C C; also guide posts E E, used to prevent the gate from running off the track when open.

Also, in combination with the posts of the main gate, represented by letters H D D C E E, letters patent for extended top and bottom rails or slats, to be used at pleasure in forming a gap moving the gate forward on the wheels C C, so that the gap thus formed will admit the passage of small stock, and at the same time exclude large stock.

64,861.—CHRISTIAN H. and JOSEPH H. HARNLY, Penn township, Pa.—*Manure Drag*.—May 21, 1867.—The fork is pivoted in the frame and is invertible to allow the ready discharge of its load when the trigger is pulled. It is used in cleaning stables.

Claim.—The arrangement of the fork drag A A' A'' A''', with its spring and lever F E, clamp rod D, and armed fork head C B, runners G, all combined and operating substantially in the manner specified.

Also, in combination with the fork-drag, figure 1, and its ring O and hook K, the rake-drag, figure 2, when used in connection with said fork-drag, in the manner and for the purpose set forth.

64,862.—CHARLES T. HARVEY, Tarrytown, N. Y.—*Propelling cars, &c.*—May 21, 1867.—The car is propelled by cables attached by clutches to the car; the clutches are actuated to catch or release the rope, to govern the motion of the car.

Claim.—First, the combination of the sliding pulley Q, with the series of teeth on the axle, by which the said pulley is made fast to the axle, and with the springs I I' of the guide rod D, for the purpose of stopping the motion of a car, substantially as shown.

Second, the combinations of the parts a and b, composing both a fast and loose pulley, with the springs I I', and the axle A, for the purpose of starting the car, substantially as shown.

Third, the use in cars or other objects which are moved by propelling cables, of clutches or arms, whose faces that receive the impulse of such cables are plain, substantially as shown.

Fourth, so arranging the guide rod D and cable clutch or arm C that they are compelled to rotate together, while the latter is allowed to have a longitudinal movement on the former, substantially as set forth.

Fifth, the combination of anti-friction rollers z with the cable clutch or arm C, to obviate or prevent friction during the movements of said clutch, substantially as set forth.

Sixth, the supplementary springs I' for strengthening and aiding the main spring I, and so arranging and connecting them between the sides of spring I and the frame of the car that they are not displaced or injured by any vertical motions of the car body, substantially as set forth.

Seventh, the application to a car of bent arms X, to hold the car down, or prevent it from being displaced from the track, substantially as shown.

Eighth, the combination of the pendulous roller q with the disk p and loose pulley b, substantially as described.

Ninth, the combination of the bar M and cam O with the lever J that operates the cable clutch or arm C, substantially as described.

64,863.—H. H. HATHEWAY, Clockville, N. Y.—*Hoarse Hay Fork*.—May 21, 1867.—The tines are attached to the handle in a ferrule consisting of two semi-cylindrical pieces clamped together. The wings of the bail swing on the outer tines. The draft rope is attached to the bail and the line of draught is adjusted by a hinged brace regulated by a pendent cord, draught upon which bends the brace and the hay is discharged.

Claim.—First, the manner of securing the tines C to the handle by combining with each other the caps b and b', bolts and nuts a a, ring e, and handle A, substantially as shown and operating in the manner described.

Second, the adjustable bail D in combination with the rings d, keys d', and brace E, substantially as and for the purpose herein shown and described.

64,864.—B. S. and E. H. HAVILAND, Fort Dodge, Iowa.—*Beehive*.—May 21, 1867.—Perforated partitions permit the circulation of air and heat through the several compartments of the hive. Slides cut off of either compartment from those adjoining, when required.

Claim.—The arrangement in the bee-box of the perforated partitions b and adjustable partitions D, whereby the communication between the several compartments C may be opened or closed, substantially as described, for the purpose specified.

64,865.—THOMPSON HERSEE, Jr., Buffalo, N. Y.—*Attaching Thills to Vehicles*.—May 21, 1867.—Explained by the claim and illustration.

Claim.—A thill coupling composed of a clip A so constructed as to have a chamber in its front part to receive a piece of India-rubber or elastic substance C, and also to receive the cross-head e of the thill iron D, the front plate c of the chamber being notched or forked at its upper end, and the top plate a of the clip over the chamber having an aperture made in it to allow the cross-head of the thill iron to pass into the chamber with a projection f to serve as a guard to prevent the casual rising of the cross-head e, substantially as shown and described.

64,866.—B. T. HENRY, New Haven, Conn.—*Carriage Spring*.—May 21, 1867.—The spring is strengthened by longitudinal ribs tapering toward the end.

Claim.—An elliptic spring having one or more ribs d formed upon its surface, substantially as and for the purpose set forth.

64,867.—FREDERICK HESS, Baltimore, Md.—*Fastening for Shirt Collars*.—May 21, 1867.—Explained by the claim and illustration.

Claim.—The fastener, composed of a plate with an eye on each side of it, one for holding an elastic loop to fasten the collar to the shirt, the other to hold a ring to secure the fastening to the collar as described.

64,868.—JACOB HOLLINGER, Millersburg, Ohio.—*Cultivator*.—May 21, 1867.—The salient bends of the curved beam serve as points of attachment for the standards which are adjustable on the beam and braces.

Claim.—The curved beam A, as arranged in combination with the adjustable standards B and braces E H, for the purpose and in the manner substantially as set forth.

64,869.—J. W. HOLLINGSWORTH, Salem, Indiana.—*Animal Trap*.—May 21, 1867.—Improvement on his patent, Oct. 16, 1866.—The spring eccentric is freed by the weight of the animal, which trips the doors and releases the division drop-gate between the compartments; the animal by passing under this gate resets the trap.

Claim.—First, the shaft E bearing the spring G, eccentric D and double crank H, to which are connected the rods I pivoted to wings J, in combination with the rocking plate L supporting the pivoted levers M provided with stops m', constructed and operating in the manner and for the purpose specified.

Second, the stops m' in combination with the levers M, pivoted to the rocking plate L, arranged relatively with the shouldered eccentric D, operating substantially as described and for the purpose specified.

Third, the rod P provided at one end with a catch fitting into notch in the end board F, and connected at the end by rod O' to lift gate O, operated by the shouldered eccentric D, and arranged relatively with the working parts of the trap herein described, substantially as and for the purpose specified.

64,870.—WILLIAM E. HOUSTON, Birmingham, Conn., assignor to himself, GEO. W. HUBBELL, and J. R. LATTIN, same place.—*Hoop Skirt*.—May 21, 1867.—The hoops are passed through the transverse pockets, having a central part in which one set of the filling threads is left unwoven on the outside, for the attachment of the hoop by a metallic clasp, which does not run through the tape, and which can be therefore attached while the skirt is on the form.

Claim.—First, securing the hoops to the tape by a clasp or other device, enclosing the tape upon the hoop without extending through the tape, substantially as herein set forth.

Second, the combination of the cord-band or other material inserted in or attached to the tape with the hoops when the hoops are attached thereto, substantially as specified.

64,871.—WILLIAM E. HOUSTON, assignor to himself, GEORGE W. HUBBELL, and JOHN R. LATTIN, Birmingham, Conn.—*Clasp for Hoop Skirts.*—May 21, 1867.—Explained by the claim and illustration.

Claim.—Securing the two ends of hoops by a clasp corrugated thereon diagonally and at reverse angles upon opposite sides, substantially as described.

64,872.—WILLIAM E. HOUSTON, Birmingham, Conn., assignor to himself, GEORGE W. HUBBELL, and JOHN R. LATTIN, same place.—*Tape of Hoop Skirts.*—May 21, 1867.—This relates to the vertical tapes of the "tabs." The longitudinal pocket is on the edge of the tape.

Claim.—A tape formed with a longitudinal pocket C, combined with transverse pockets B, substantially in the manner herein set forth as an improved article of manufacture.

64,873.—WILLIAM E. HOUSTON, Birmingham, Conn., assignor to himself, GEORGE W. HUBBELL, and JOHN R. LATTIN, same place.—*Tape of Hoop Skirts.*—May 21, 1867.—The transverse pockets have central portions in which one set of the filling threads runs through without weaving.

Claim.—The tape formed with the thread spaces C, in combination with the pockets B B, substantially as and for the purpose specified as an improved article of manufacture.

64,874.—EDWARD HOWARD, Boston, Mass.—*Making Balance Wheels for Watches, &c.*—May 21, 1867.—The steel rod is polished, heated, coated with a strong solution of borax, and inserted into a brass tube polished inside; it is then placed in a crucible and the brass melted, attaching it closely to the steel. The crucible is broken, and the brass-coated rod is sawn up into disks or wheel blanks.

Claim.—The process or mode of making a series of balance-wheel disks or buttons by the use of the crucible, the brass tube, and the steel rod, substantially as herein described and for the purpose specified.

64,875.—S. TERRY HUDSON, Success, N. Y.—*Sugar Cone Stripper.*—May 21, 1867.—The lap-jaws are closed by reversible springs and have a swivel spring guard plate that works on their face. The standard is driven into the ground in the vicinity of the cane or the mill.

Claim.—First, the double pairs of springs B B, having lap-jaws *c* c for opening by each other and varying the spaces C C, and combination with the swivel guard plate *d* attached to the spring D and the stand A, all arranged and operating substantially as and for the purpose herein described.

Second, the shifting spring E in combination with the springs B B, arranged and operating as and for the purpose herein set forth.

Third, the movable stand A, provided with the point *h* or its equivalent, and the head F, in combination with the spud *a*, arranged as and for the purpose herein specified.

64,876.—GEORGE R. HUGHES, Centralia, Mo.—*Washing Machine.*—May 21, 1867.—The tub bottom and under side of the disk are corrugated. The disk is lowered onto the clothes, and has rotation and slight vertical movement by the vertical oscillation of the operating lever.

Claim.—The cylinder or drum E, the bent lever C, the lever J, the ratchet and pawl C, for tightening the cord on the cylinder or drum F, the shaft E, the cords H and K, and the disk D, constructed, arranged, and operating substantially as described in combination with the frame A.

64,877.—D. H. HULL, Plantsville, Conn.—*Seed Planter.*—May 21, 1867.—The seed hoppers are carried on a rear frame, hinged to the main frame, and adjusted vertically by a chain passing over a sheave and turned around an adjustable shaft.

Claim.—First, the device for operating the slides *jj* of a seed planter, consisting of the lugs *m* on the slides, connecting rods O, crank shaft C, pinion *b*, and

internal gear or driving wheel F, all combined with each other and made and operating substantially as herein shown and described.

Second, the device for raising and lowering the hinged frame H, which consists of the chains K passing over the pulley *e* on the stationary arm N, shaft L, and ratchet-wheel and pawl *h* *i*, all made and operating substantially as herein shown and described.

Third, the frame H, when it is provided with the seeding boxes, and when it is hinged to the main axle A, substantially in the manner and for the purpose herein shown and described.

64,878.—JAMES M. HUME, Colchester, Ill., assignor to himself and C. F. HOYT, same place.—*Cultivator.*—May 21, 1867.—The double tree is pivoted on a vertical post of the frame, which has a brace plate to the tongue. The ends of the double tree are connected to the upper ends of levers, pivoted to the frame, and to the lower ends of said levers the single trees are connected.

Claim.—The adjustable levers B, arranged in combination with the frame A, beams K, links L, bar G, and single tree M, as and for the purpose substantially as described.

64,879.—RALPH S. JENNINGS, New York, N. Y., assignor to himself and N. G. Kellogg, same place.—*Envelope.*—May 21, 1867.—The corners under the top flap are closed by counter folds, which form continuous parts of the central folds, the ends of which are united by clinched rivets.

Claim.—First, in constructing flat envelopes cutting and folding the same to form corner wings E E at the ends thereof, in combination with the eyelet seals *e* *e'*, substantially in the manner and for the purpose herein described.

Second, fastening central flaps C C of an envelope with the double metal spars *d* *d*, or their equivalents, as and for the purpose herein specified.

64,880.—A. W. JOHNSON and GEORGE THOMPSON, New York, N. Y.—*Permutation Lock.*—May 21, 1867.—The tumbler disks are connected by sleeves to enter disks lettered on their edges. The inner disks have each a notch, whose coincidence allows the spring pawl to enter them, when a partial rotation of the disks draws back the bolt.

Claim.—The adjustable tubes O, of unequal length, fitting over each other, their outer ends provided with teeth *c*, which fit into corresponding teeth in the flange *d* of the graduated adjustable rings Q, fitting one within the other, the said tubes provided upon their inner ends with notched disks M, the notches in the outer ring being bevelled upon one side, when all are constructed and arranged as described and operating from the yoked-shaped bolt G, provided with the spring pawl V, substantially as described for the purpose specified.

64,881.—W. B. JONES, Franklin, Ky.—*Motive Power.*—May 21, 1867.—The power applied to the crank shaft revolves the heavy frustum, whose cogged wheel runs upon the rim of the inclined wheel and gives motion thereto.

Claim.—The combination of the inclined wheel or frame A, cylinder C, and lever shaft E, when arranged together so as to operate together, substantially in the manner and for the purpose described.

64,882.—PETER KECK, Zanesville, Ohio.—*Pruning Shears.*—May 21, 1867.—The hand levers are pivoted together; one of them projects forward to form the concave jaw, and the other is pivoted to the sliding plate of the concave-edged cutter.

Claim.—First, the mode of attachment of the blades of a pair of shears composed of three levers, substantially as shown and described.

Second, the combination of a convex-edged cutting blade, with the mode of attachment of the blades of a pair of shears, composed of three levers, substantially as shown and described.

64,883.—JOHN W. KINGSBURY, New Bedford, Mass.—*Horseshoe Machine.*—May 21, 1867.—The die is changeable for varying sizes of shoes, and is reciprocated, pressing the blank between rollers, which conform it to the shape of the die. The heels are pressed in and thickened by a pair of jaws forced

against the shoe by friction rollers, and the toe flattened by pressure against a stationary block.

Claim.—First, the slotted arm E, in combination with the sliding frame F and die G, whereby the movement of said die is initiated, substantially as herein shown and described.

Second, the adjustable rollers H, having upper and lower plates of different diameters and thickness, in combination with the slotted plates g, all as herein shown and described.

Third, the combination of the adjustable block M, or its equivalent with the reciprocating die G, for the purpose of flattening the toe of the shoe, substantially as set forth.

Fourth, the combination of the reciprocating die G, adjustable rollers H, clamping jaws I, for the purpose of forming horseshoes, all made and operating as herein shown and described.

Fifth, the adjustable block M, or its equivalent, in combination with the reciprocating die G and clamping jaws I, for the purpose of flattening the toe of the shoe, all as set forth.

Sixth, the device for operating the jaws I, consisting of the cam o on shaft C, rod n, block L, rollers m n, plates l and springs q q, all made and operating substantially as set forth.

64,884.—A. LEE, St. Paul, Minn.—*Heating Stove.*—May 21, 1867.—The deflector throws back on to the horizontal and vertical open-ended air cylinders the heat that would otherwise escape up the chimney.

Claim.—The deflector E and the vertical cylinder D, in combination with the air cylinders B and C, as and for the purposes specified.

64,885.—W. and C. LEFFINGWELL, Clarksburg, Ohio.—*Hog Holder.*—May 21, 1867.—One of the side pieces is hinged, and they are adjustable in distance by the upper transverse pieces, which have slats attached to prevent the upward escape of the hog.

Claim.—First, the device for holding hogs for the purpose of wiring, ringing, or snouting, or for slaughtering or otherwise operating upon them, adjustable to the size of the hog, in manner and by the appliances, substantially as described.

Second, the hinged side D', when combined with the hinged roofing E E F F, or their respective equivalents, substantially as described.

Third, the inclined slat H, or its equivalent, when combined with a box or trough, having its front opening contracted by the slats G G', or by an equivalent construction, substantially as described.

Fourth, the tail-gate I, or its equivalent, when combined with a box or trough having its front opening contracted by the slats G G', or by an equivalent construction, substantially as described.

64,886.—HENRY LITTLE, Middletown, N. Y.—*Device for Elevating Ice.*—May 21, 1867.—The spiral band slides beneath the block of ice, pressing it against the stationary bearing, and elevating it to the upper platform.

Claim.—The rotary screw elevator, in combination with the bearing, arranged to operate in the manner substantially as and for the purpose set forth.

64,887.—JOHN LITTLE, Newburg, N. Y.—*Desulphurizing Iron Ore.*—May 21, 1867.—The ore is placed on movable plates, and when heated to redness, is then dumped into water by means of the tackle. When removed from water, it is crushed before passing to the cupola.

Claim.—First, the mode of desulphurizing iron ore by heating it in a furnace to red-hot temperature, and throwing it then into cold water, substantially as set forth.

Second, the combination of processes for desulphurizing iron ore, and preparing it for direct use in cupolas by heating, cooling in cold water, crushing between rollers, washing and mixing with fluxes for the reduction, to clean iron in cupolas.

Third, the furnace A, in combination with the movable plates S' S' and the hoisting gears M' M', for moving these plates with the ore, substantially as set forth and as shown in the drawing.

64,888.—JOHN M. LONG, Hamilton, Ohio.—*Harvester Rake.*—May 21, 1867.—The shaft is set at an angle of 45°, and rotates in bearings on a post at the

angle of the quadrant platform. At its upper end is a disk, with angularly projecting reel arms. Upon the shaft is sleeved a disk, in whose outer projections the shaft of the rake-head is journaled, being governed by a spring on the shaft, a stop-pin on the disk, and a projection on the bearing post of the main shaft.

Claim.—The rake head I attached to a shaft H on a disk G, having an inclined axis, and arranged with a spring J, to operate in the manner substantially as and for the purpose specified.

Second, the sleeve F, placed loosely on the shaft C, in connection with the clutch L, when said parts are used in connection with the rake and beaters, in the manner substantially as and for the purpose set forth.

64,889.—Cancelled.

64,890.—W. H. MAYO, Hillsburgh, Nova Scotia.—*Car Coupling.*—May 21, 1867.—One draw-head has a pivoted hook which engages over a shoulder in the other draw-head. It is locked in place by a latch connected to a spring lever which may be moved back to free the hook from the shoulder and latch.

Claim.—The drawhook B, connected by a pin a to one draw-head A, in combination with the box D, attached to the other draw-head C, and provided at its front part with an inclined bottom e, the bent plate E, lever F, connected with plate e, and with an arm i by a rod k and the spring g, all arranged to operate substantially in the manner as and for the purpose herein set forth.

64,891.—T. A. McFARLAND, Meadville, Pa.—*Can Opener.*—May 21, 1867.—The pointed beveled edge cutters cut a circular hole into a can.

Claim.—As a new article of manufacture, the can opener consisting of the handle A and cutters C, constructed, arranged, and operating as described, for the purpose of cutting out a disk or plug at a single blow, as set forth.

64,892.—LLOYD MIFFLIN, Germantown, P.—*Solar Chronometer.*—May 21, 1867.—Of the two semi-circular arcs, which are brazed together at their mid-length and at right angles to each other, one represents the equator and is graduated for a time scale; the other arc represents the meridian and supports the bearings of the frame in which the gnomon is placed. The gnomon is a metallic plate with an opening equal in length to the distance between the points corresponding with the extreme declination north and south.

Claim.—A gnomon so formed as to throw the shadow backward when the sun is fast, and forward when it is slow, to an extent equal in each case, to its variation from mean or clock time, so that the shadow of the gnomon will always cross the time-scale at a point indicating the mean time, substantially as described.

Also, correcting the variation from mean or clock-time by the use of the sun's motion in his declination, north or south.

64,893.—WARREN P. MILLER, New York, N. Y.—*Grindstone.*—May 21, 1867.—The blocks are attached to a metallic disk forming a ring of grinding material, the face of which is used for grinding saws, &c.

Claim.—First, the mode of securing the blocks B to the disk A, by means of the flange a, and keys C, all made and operating substantially as herein shown and described.

Second, the grooves d d', when arranged in the grinding surface, substantially in the manner and for the purpose herein shown and described.

Third, constructing grindstones by combining the shaft D and the disk A with the stones B, keys C, all made and operating substantially as and for the purpose herein shown and described.

64,894.—FRANCIS E. MILLS, San Francisco, Cal.—*Door Indicator.*—May 21, 1867.—An aperture is made in the door and fitted with glass, behind which are tablets for conveying announcements. A semi-circular opening communicates with the letter-box inside.

Claim.—First, the reversible box b, provided with the lettered cover c having the hole h and revolving

disk P, said box containing a series of letters or blank disks S S, adapted to be placed in the sink *t*, in the reverse end of said box, substantially as described for the purpose specified.

Second, the reverse box *b*, in combination with the door glass plate *A*, having circular opening *B*, and semicircular opening *D*, substantially as described for the purpose specified.

64,895.—THOMAS and THOMAS H. MITCHELL, Albany, N. Y.—*Steam Generator.*—May 21, 1867.—The water is thrown into the boiler in jets and flashes into steam. The boiler rotates in the furnace. The water is received through one of the trunnions, and the steam passes out through the other.

Claim.—The generator mounted so as to rotate on a horizontal or nearly horizontal axis, and within a furnace, substantially as described, in combination with the pipe or pipes for supplying and jetting the water, substantially as and for the purpose set forth.

Also, the combination of the generator rotating within the furnace, the steam-pipe and steam-chest, and the pipe for supplying and jetting the water within the generator, substantially as and for the purpose set forth.

Also, the combination of the generator rotating within the furnace, the pipe for supplying and jetting the water, the steam-pipe and steam-chest, and the blow-off pipe substantially as and for the purpose set forth.

Also, the steam-pipe attached to and rotating with the generator, and provided with apertures, when combined with the steam-chest and stuffing-box, so that while rotating, it will discharge the steam into the stationary chest, substantially as and for the purpose set forth.

64,896.—JOHN MORGAN, jr., Wheeling, W. Va.—*Bolt and Rivet Machine.*—May 21, 1867.—The bar is thrust into the hole of the reciprocating carrier and is brought in contact with a cutter to remove the blank; the carrier brings the blank to the die and the heading die is brought down while the rod is in contact with the rivet.

Claim.—First, the construction and arrangement of the solid die *x'*, follower *U*, header *N*, and cams *D* *E* *F* and *I*, upon the shaft *B*, substantially as herein shown and described for the purpose specified.

Second, the carrier *W*, knife *10*, and shield *16*, combined, arranged, and operating in the manner and for the purpose specified.

Third, the solid die *x'*, for forming the under side of the head of the rivet concave, as herein set forth for the purpose specified.

64,897.—GEORGE A. MOSS, New York, N. Y.—*Box for Blueing and other Powders.*—May 21, 1867.—The box is formed by boring a hole into a block of wood and covering it with foil. The box is covered with a sheet of foil, which is punctured by a pin to allow the powder to escape gradually, when shaken.

Claim.—A box for powders, of the class specified, constructed of wood and provided with a cover of foil, or its equivalent, substantially as shown and described.

64,898.—JOHN H. J. O'NEIL, New Haven, Conn.—*Car Coupling.*—May 21, 1867.—The draw-head is supported in a yoke allowing vertical movement, and retained at its rear end by a bolt extending through a vertical slot of a bracket. Spiral springs on the bolt each side of the bracket hold it in position. The mouth-ring is hinged and may be depressed to allow coupling to a low car, a spring beneath raising it when free. In coupling, the link forces around a tumbler-catch which is held by a pawl. For uncoupling the pawl is raised by a treadle.

Claim.—First, the combination of the hook *F*, the pawl *I*, and lever *N*, when constructed and arranged so as to operate substantially in the manner herein set forth.

Second, the head *C*, constructed so as to be depressed, independent of the case *B*, substantially as set forth.

Third, the arrangement of the lugs *f*, or in combination with the frame *R*, operating so as to relieve the spring, substantially as herein set forth.

64,899.—ABRAHAM W. OVERBAUGH, New York, N. Y.—*Portable Blacking Case.*—May 21, 1867; an-

tated May 16, 1867.—A book-formed case has hinged supports; inside are a hinged foot-rest and cavities for blacking-box and brushes.

Claim.—First, the arrangement and combination of blacking and polishing utensils, in the manner described, so that the case, when unfolded, forms a stand or bench.

Second, also the feet, combined with the devices, in the manner so as to form an even surface when closed.

64,900.—ARTHUR PAGET, Loughborough, England.—*Knitting Machine.*—May 21, 1867.—Cannot be briefly described other than in substantially the words of the claims.

Claim.—First, the method of and arrangement for retaining each sinker in position by a spring, which also assists the action of the sinker when sinking the thread.

Second, the combination of the bars *C* *D* and the sinkers *C*, when the whole are constructed and operate in connection with each other, as set forth.

Third, the arrangement for drawing across the incline or other equivalent, first in one direction and then in the other, by a double grooved pulley revolving with the main shaft, and by cords or chains and weights or catch-blocks, so arranged as to draw across once during a part of each revolution.

Fourth, the method of suspending the action of the drawing-across motion by the employment of an incline or cam-piece, so arranged that when required it can be made to lift a hinged incline piece, or other mechanical equivalent, and thus prevent the catch-block entering the notch in the drawing-across pulley, by which the said catch-block would otherwise be carried round.

Fifth, the method of producing a selvedge in any part of the width of the frame by the employment of an incline or other mechanical equivalent attached to and traversing with the incline for actuating the sinkers or their equivalents, by which first-mentioned incline the thread layer or thread layers is or are made to descend and pass between the needles at the end of each course.

Sixth, the plates *E'* of steel or other hard metal, in combination with the bar *E*, as described.

Seventh, the method of alternately-knitting web and narrowing or widening the same, or making changes in the knitting; by moving endwise in the direction of their axes the set of cams or levers employed in knitting the web, and another set or sets of cams or levers employed in effecting the narrowing, widening or changes in the knitting.

Eighth, the method of producing by a self-acting motion, in which cams, inclines, or levers can be used, the before-mentioned endwise movements of the cams or levers, which said self-acting motion can be (without arresting the revolution of the cams) brought into operation by hand, or by tappets, or holes, in an endless chain, belt, drum, or pulley.

Ninth, each of the foregoing methods or arrangements in combination with any or all of the other methods or arrangements.

64,901.—ISAAC PEDRICK, Bridgeton, N. J.—*Bedstead.*—May 21, 1867.—The frame which supports the slats has corner holes to receive one end of a double hook, whose other end engages a metal loop on the post. The slats are held together by cords, which pass around the ends of the corner hooks, and are so lapped as to allow their insertion.

Claim.—First, the frame *E* *F* *G* *H* *K*, and hooks *I*, or their equivalents, in combination with each other and with the posts *D*, substantially in the manner herein shown and described and for the purpose set forth.

Second, the post sockets *C*, in combination with the posts *D*, rails *A* and *B*, and frame *E* *F* *G* *H* *K*, substantially as herein shown and described and for the purpose set forth.

Third, stringing the slats *L* upon or connecting them with a cord or tape *M*, substantially in the manner herein shown and described and for the purpose set forth.

64,902.—HENRY H. PEMBER, New York, N. Y.—*Card Holder.*—May 21, 1867.—For attachment to a trunk to receive the direction card. Explained by claim.

Claim.—The card holder, consisting of rectangular

piece of metal B, having a flange *a* along the edges of the two ends and its lower side D, the upper side left open and provided near its center with the catch E, and perforated ear-pieces F F, when all are constructed of one piece of metal, as herein set forth.

64,903.—CHARLES H. PERKINS and RICHARD W. COMSTOCK, Providence, R. I.—*Machine for Swaging Horseshoe Blanks.*—May 21, 1867.—The shoe is first swaged between a fixed straight bar and a plate oscillating upon an adjustable pivot and actuated by reciprocating levers. The blank is bent around the former in its passage between pressure rollers.

Claim.—The combination of the vibrating swaging bar C, operating as described with the stationary bar A, for swaging the heels or horseshoe blanks, substantially as described.

64,904.—BACCHUS PERRY and AARON CORNISH, Lee, N. Y.—*Bolt Holder.*—May 21, 1867.—The bolt shank is held between the forked jaw and the adjustable toothed head of the other jaw. The jaws are retained in position by a ratchet and link at their free ends.

Claim.—The bolt holder, constructed and operating substantially in the manner and for the purpose herein described.

64,905.—BENJAMIN F. PORTER, Manchester, N. H.—*Colander Boiler.*—May 21, 1867.—The colander is used in a common boiler, and its bottom is adjustable vertically by pins, which occupy Z-shaped slots.

Claim.—First, the perforated boiler A, with double L-shaped slots *a*, resting wires *b*, and movable bottom constructed as described, and operating in the manner as and for the purpose specified.

Second, the divider E, in combination with a colander boiler of any kind, when constructed and used substantially as described for the purposes specified.

64,906.—L. O. ROCKWOOD, Ottawa, Ill.—*Gang Plow.*—May 21, 1867.—The plow beams are connected by slide plates, by which their distance is regulated.

Claim.—The adjustable extension joint, Fig. 4, constructed substantially as and for the purpose described in the foregoing specification.

64,907.—COLUMBUS A. ROSE, Columbus, Ga.—*Trunk.*—May 21, 1867.—The trunk is divided in a plane oblique to its sides, and the sections are hinged together and furnished with fastenings. The smaller section being swung up on the base exposes the lids of the compartments in both portions.

Claim.—A trunk provided with a triangular-hinged portion B and internal doors or lids E, capable of being employed as shelves, substantially as described.

64,908.—DUANE A. ROSS, Newport, N. Y.—*Skate Fastening.*—May 21, 1867.—The side clamps are on the ends of segmental-sliding plates contracted by a screw over whose shank the heel-clamping screw is sleeved. Each screw is turned by its thumb knob at the rear.

Claim.—First, the combination of the screw-rods *a b* with the sole and heel-clamps and with the thumb nuts *e k*, for the purpose of fastening or detaching the skate to or from the boot or shoe, substantially as described.

Second, incasing the screw-rods, nuts, and curved arms, substantially as herein described, to prevent them from injury by snow, ice, water, or other causes, substantially as described.

Third, hinging the clamp-plates *n* to the clamp-arms *d* for the purpose of adapting the clamping surface to the varied shapes or tapers of the heels of boots or shoes, substantially as described.

64,909.—J. G. ROUX, Raymond, Miss.—*Cotton and Hay Press.*—May 21, 1867.—The pivoted braces rest in cavities of the nuts upon the right and left hand-screws, which are geared to the same motive wheel and operate to draw in the lower ends of the braces and raise the follower.

Claim.—The independent screws B, having the same pitch but reverse motion, having pinions E on their inner ends, operated by the same pinion D, operating in combination with the nuts G and braces F, substantially as described for the purpose specified.

64,910.—CHARLES A. SCHAEFER, Chicago, Ill., assignor to himself, FRITZ FRILLMAN, WILLIAM WOLFF, and JOHN SCHACHTSCHOBER, same place.—*Hanging and Locking Sash.*—May 21, 1867.—The rack upon the stile has geared connection to the spring wheel, which is sufficiently strong to support the sash. A semicircular stop is turned to engage the wheel to lock the sash.

Claim.—The half-round locking-stud I, in combination with a rack J and pinion F, to lock a window sash at any desired point, substantially as set forth.

64,911.—CHARLES A. SCHAEFER, Chicago, Ill., assignor to himself, FRITZ FRILLMAN, WILLIAM WOLFF, and JOHN SCHACHTSCHOBER, same place.—*Sash Supporter.*—May 21, 1867.—The screw cylinder is inserted transversely into the side of the sash and contains the spring shank of the friction roller which rests against the stile.

Claim.—The combination of the screw cylinder A, shank C, spring I, and fork *c* with the roller *d*, substantially as and for the purpose set forth.

64,912.—ELIJAH U. SCOVILLE, Manlius, N. Y.—*Seed Sower.*—May 21, 1867.—The rotating roller has longitudinal grooves to receive the seed from the hoppers, the seed dropping on zigzag wire-spreaders. The hoppers are adjustable on the roller. The supporting rods of the seed-box have rubber foot blocks to allow a vertical adjustment.

Claim.—First, having two or more hoppers E, within one seed box D, substantially as and for the purpose herein shown and described.

Second, the grooved roller F, when arranged below the hoppers and when provided with adjustable slides *c e*, by which the amount of the seed discharged is regulated, substantially as set forth.

Third, the revolving spreader G, when provided with perforated wings *i i*, substantially as and for the purpose herein shown and described.

Fourth, the perforated wings *i i*, when arranged in zigzag lines upon a revolving shaft G, substantially as and for the purpose herein shown and described.

Fifth, the hoppers E, when arranged in a seed-box D, which is supported by braces *b*, in combination with the spring *c*, and screw *a*, and roller F, substantially as herein shown and described.

Sixth, the grooved roller F, in combination with the rubber-scrapers *h*, which are secured in that side of the hoppers E, toward which the seed is carried by the roller, as set forth.

Seventh, the zigzag perforated revolving spreaders, in combination with the grooved rollers F and hoppers E, all made and operating substantially as herein shown and described.

64,913.—JOHN E. SEAVEY, Kennebunkport, Me., assignor to himself and S. E. BRYANT.—*Tip-cart Body Fastening.*—May 21, 1867.—The bearing projection on the body has a segmental recess to receive the eccentric end of the weighted lever, which is attached by a yoke to the frame.

Claim.—The cart-body fastener made substantially in the manner and for the purpose and to operate as specified, it being composed of the weighted arm A, the eccentric *b*, the yoke B, and the bearing D, formed and arranged as explained.

64,914.—DAVID J. SELDEN, Mount Vernon, Ohio.—*Plow Point.*—May 21, 1867.—The point is run on a tenon of the share, and they are traversed by a vertical doubly countersunk hole and spring-ended pin.

Claim.—The wrought-iron tenon cast in the cast-iron share, with shouldered on each of the four sides of the tenon, the point with the mortise to fit the wrought-iron tenon, with either side of the point up and with the back end of the point of the same size and meeting the shoulders on the cast-iron share. The countersunk hole through the mortised point and the wrought-iron tenon, with the pin passed through the hole to keep the point to its place on the tenon, and the split point of the pin so sprung as to keep it in its place and to hold the point to its place on the tenon with either side up.

64,915.—HENRY F. SHAW, West Roxbury, Mass.—*Hoisting Gear.*—May 21, 1867.—The barrel is attached to a spur wheel, which is surrounded and engaged by a ring gear of larger diameter. This ring

gear is attached to a lever slotted to receive a guide pin near its lower end. The winch has a crank pin entering this lever and gives an oscillating motion to the ring gear, which rotates the spur wheel to an extent equal to the difference in number of cogs between that and the ring gear.

Claim.—First, the combination as well as the arrangement of the ring gear H and spur wheel D, operating as described and for the purposes set forth.

Second, the combination of the ring gear H with the lever K, made substantially as described and for the purpose set forth.

64,916.—LORENZO SIBERT, Mount Solon, Va.—*Manufacture of Iron and Steel.*—May 21, 1867.—The flux is composed of manganese, salt, and limestone. The metal is run into heated iron moulds and heated in a furnace, the moulds being covered with powdered manganese; it is cooled slowly and may be hammered and rolled.

Claim.—The improved method of manufacturing iron and steel, substantially as herein described.

64,917.—GEORGE W. SMITH, Mount Olivet, Ky.—*Garden Cultivator.*—May 21, 1867.—The head has cultivator teeth and an adjustable and removable harrow frame. It has a hook for a draft strap, and vertical pins for attachment of a weight block.

Claim.—The cultivator in its combined form, having a number of tools E F F G G H, easily detached for separate use and capable of combined use, substantially as described.

64,918.—J. SMITH and J. F. IRVIN, La Porte, Ind.—*Car Coupling.*—May 21, 1867.—The swinging pin may be thrown back by the entrance of the link, or may be drawn back by the slide, actuated by a rack and pinion.

Claim.—The slide D, the pinion E, the coupling pin B, and the shaft F, constructed, arranged and operating substantially as herein shown and described, in combination with the draw-head of a railroad car, for the purposes set forth.

64,919.—E. E. STEDMAN, Randolph, Ohio.—*Corn Sheller.*—May 21, 1867.—The machine is grasped by the handles, and the point-end of an ear inserted between the spring jaws. The machine is revolved, shelling the corn from the cob and discharging it at different apertures.

Claim.—The jaws C, springs E, as arranged in combination with the case A, for the purpose and in the manner described.

64,920.—H. L. STIBBS, Savannah, Ga.—*Temporary Rudder.*—May 21, 1867.—The jury rudder is hinged to the forked straps, to whose ends cords are attached, and which are made fast to the ship's sides. Its post passes through the post-hole, being drawn in with a rope in slipping.

Claim.—The combination of the chains D, or their equivalent, and branched or forked hinge-straps C, with the body of the rudder B, substantially as herein shown and described and for the purpose set forth.

64,921.—W. A. STOWELL, Moretown, Vt.—*Car Coupling.*—May 21, 1867.—The pin is held in the upper horizontal bar of the falling yoke, and the lower bar of the same is engaged by the hook of a swinging lever, and tripped by the entering link.

Claim.—The combination of the yoke E, holding the coupling-pin F, bumper-head A, having two mouths, bent lever I, and pivoted hook H, substantially as described for the purpose specified.

64,922.—JAMES B. STRICKLAND, Scranton, Pa.—*Adjustable Eccentric.*—May 21, 1867.—The slot in the arm of the collar which is keyed to the shaft receives a bolt passing through the eccentric by which the latter is adjusted on the shaft.

Claim.—The combination and arrangement of the collar and arm B C, and the eccentrics E F, substantially as herein shown and described for the purpose set forth.

64,923.—J. W. SUSA, San Leandro, Cal.—*Gang Plow.*—May 21, 1867.—The fore-end of the plow-frame is adjustable vertically in respect to the wheels. The tongue is pivoted and has a vertically adjusting

screw, connecting its rear end to a metallic plate attached to the frame.

Claim.—First, the combination and arrangement of the shaft e, the segment arms d d', the axles g g' of the wheels D D, the hand lever h, and the rack k, for raising and lowering the gang plows A A, substantially as herein described.

Second, The arrangement of the draft-pole F, pivoted to the plow beams B B, and depressed and elevated by the screw a, substantially as and for the purpose set forth.

64,924.—JACOB VAIL, Beloit, Wis., assignor to himself and JOHN H. LINDERMAN, same place.—*Gate.*—May 21, 1867.—The cords by which the gate is swung run on pulleys pivoted to the ends of the horizontal bar, and over-pulleys pivoted to posts, standing at right angles to the gate when shut.

Claim.—First, the arrangement of the cords H and I, and pulleys J L O P, with each other and with the gate B, for the purpose of opening and closing said gate, substantially as herein shown and described.

Second, making one of the horizontal boards or bars of the gate act as a sliding latch, substantially as herein shown and described and for the purpose set forth.

Third, the combination of the coiled spring E, or its equivalent, with the sliding bar b', substantially as herein shown and described.

Fourth, the combination of the pivoted lever T, with the gate B, sliding bar b' and operating cords H and I, substantially as herein shown and described and for the purpose set forth.

64,925.—H. WESTON, Towanda, Pa.—*Attaching Burners to Lamps.*—May 21, 1867.—A packing strip of leather fills the circular groove in the neck and forms a yielding surface against which the attaching screw impinges.

Claim.—Providing the interior of the collar C with a screw, and having the exterior of the projection B covered with a packing a of leather or any suitable cement or composition, with set screws c passing through the collar, substantially as and for the purpose set forth.

64,926.—BENJAMIN F. WHITNER, Madison, Fla.—*Planter and Manure Distributor.*—May 21, 1867.—The furrow-opening plow-point is followed by the bevel-edged wheel which gives shape to the furrow. The bottom of the seed-hopper is closed by the cylinder whose recesses are adjustable to the amount of seed required; a covering drag follows. By removing the annular ring from the cylinder and adjusting the sliding brushes in the hopper, fertilizers may be distributed.

Claim.—The combination of the furrow opener g, the furrow wheel A, and the covering drag D with each other and with the planting cylinder C and the seed receptacle B, substantially in the manner and for the respective purposes herein set forth.

Also, the grooved planting cylinder C when it is combined with a jointed and a recessed ring i, and when the said cylinder works in combination with the furrow opener g, the furrow wheel A, and the covering drag D, substantially in the manner herein set forth.

64,927.—ALBERT WILCOX, Maquoketa, Iowa.—*Shovel Plow.*—May 21, 1867.—The extra side shovel is attached and secured by a curved supporting bar and brace, and the equilibrium of the draft is maintained by the extra curve and size of the high shovel.

Claim.—The attachment of the third shovel A, by means of the curved-supporting bar B to the beam C of the main plow, also the manner of equalizing the draft of said plow, by making the left-hand standard of the main plow more curved and the shovel on the same a size larger, in the manner and for the purpose above set forth.

64,928.—MARVIN T. WILLIAMS, Milwaukee, Wis.—*Egg-Beater.*—May 21, 1867.—The propeller blades on the shaft dash the eggs against the beating arms.

Claim.—Propeller blade M, beating arms L, shaft I, pinion F, cover H, and cog-wheel D, arranged and combined substantially as and for the purpose described.

64,929.—JOSEPH WOODRUFF, Rahway, N. J.—*Steam Generator.*—May 21, 1867.—Pipes descend vertically from the main boiler to the smaller boiler beneath, and other pipes pass upward from the lower boiler and discharge into the upper one at different altitudes.

Claim.—First, the connection of two boilers by means of the pipes D D, substantially as described.

Second, extending the tubes D D, a nozzle into the boiler and bending or deflecting the same, for the purposes substantially as set forth and described.

64,930.—HENRY A. ALDEN, Matteawan, N. Y.—*Car Spring.*—May 21, 1867.—The concavo-convex plates are arranged in pairs, making double convex springs whose enclosed spaces are filled with rubber.

Claim.—In a spring composed of one or more pairs of concavo-convex, or conical and radially corrugated plates, as described, interposing between the plates of each pair a disk of vulcanized rubber or other elastic body of suitable dimensions, substantially in the manner and for the purposes set forth.

64,931.—CHARLES H. AMDON, Greenfield, Mass.—*Brace for Bits.*—May 21, 1867.—The shank of the bit is clamped between the stirrup and socket; the latter has a projection in front of the shoulder of the bit to keep it in the socket.

Claim.—The combination of the clamping stirrup B and shoulder G in the shank of a bit-brace, for the purpose set forth.

64,932.—CHARLES H. AMDON, Greenfield, Mass., assignor to BAILEY WASHING AND WRINGING MACHINE COMPANY, Woonsocket, R. I.—*Clothes Wringer.*—May 21, 1867.—The journals of the gear wheels on the roller shafts are linked to the journals of the wheels by which they are driven, the latter wheels engaging to maintain their coincident motion. The upper roller has vertical adjustability and its boxes are depressed by a spring bar connected by rods at its center to springs in the upper corner of the frame.

Claim.—First, the cog wheels C D E F connected together at their axles by the straps or links *d e f*, so as to form a flexible train of gearing between and in combination with the rollers B B of a clothes wringing machine, substantially as and for the purpose set forth.

Second, the levers H H, arranged substantially as set forth, to be in opposition to a resisting force exerted by a spring or springs, or their equivalent.

64,933.—WILLIAM H. APPLIGATE, Le Claire, Iowa.—*Coffer-Dam and Boat.*—May 21, 1867.—The boat has a large central opening, surrounded by water-tight casings, between which plank is driven down into the bed of the river; the space between the plank is tamped with clay, and the water pumped from the central space.

Claim.—First, the construction and arrangement of a floating coffer-dam and boat combined, having the water-tight compartments and provided with the series of frames arranged to support the planking, substantially as herein shown and described.

Second, in combination with a combined coffer-dam and boat constructed as described, the shafts A and F, and the carrier or endless belt D, for removing material from within the dam, substantially as set forth.

Third, the construction and arrangement of the boat with an opening at its rear end, substantially as described.

64,934.—EDWARD BALBACH, Jr., Newark, N. J.—*Separating Zinc from Gold and Silver.*—May 21, 1867.—A movable black-lead retort with a neck is placed in a furnace so that it can be turned up for the reception of the alloy of gold, silver, and zinc; the latter is distilled off, and the retort turned down to empty out the precious metals.

Claim.—A movable black-lead retort formed with a neck and introduced within a furnace, substantially as set forth, for receiving gold, silver, lead, and zinc alloys, and distilling off the zinc, the remaining alloy being poured out by inclining the retort, as set forth.

64,935.—PETER BARRY, Newark, N. J.—*Machine for Wiring Blind Stats.*—May 21, 1867.—The roller is placed between the frame and a ratchet guide-rod,

having a shoulder engaging the rear end of the rod by which it is driven forward, reciprocating pawls engaging the ratchet for that purpose. The pawls are astride of an inclined bar, and slide toward the operating plunger. One staple is automatically separated from the rest, and descends beneath the plunger by which it is forced into the roller.

Claim.—First, the independent cut-off F, arranged to operate upon the staples by coming between them from above, substantially as described.

Second, the independent cut-off, in combination with the guides *e e*, which guide its free end to the guide-strip B, substantially as shown.

Third, the combination of the elbow lever S, the slot F, the pawl L, and the adjusting shoe M, substantially as shown.

Fourth, in combination with the feeding pawl L, the adjusting shoe M, and the feeding bar or rack, substantially as shown.

Fifth, the application of a spring-plate R to the feeding mouth or space below the plunger, when arranged and combined with a rigid or unyielding guide-strip B, substantially as set forth.

64,936.—A. R. BARTRAM, Redding, Conn.—*Attaching Carriage Thills.*—May 21, 1867.—The coupling loops are forged upon short tangs that slip telescopically in the sockets of the cross-head to which the tongue or thills are attached. The points of the set screws enter grooves in the sides of the tray to prevent rotation.

Claim.—First, the adjustable coupling A, in combination with the cross-bar C, substantially as set forth.

Second, the tang B, of the coupling A, provided with a groove, as set forth, in combination with the socketed cross-bar C and the set screw E.

64,937.—J. H. BEAN, Marietta, Ohio.—*Lifting Jack.*—May 21, 1867.—The lever is pivoted on the ends of two vertical ratchet bars, sustained by spring pawls, and is raised by oscillation in a vertical plane, the pawls acting alternately as fulcrums.

Claim.—The lever E, the serrate bars C C', both the latter working in the vertical passages B B', for greater security, in combination with the levers F F' and detents G G', and springs *b b'*, the detents pivoted to the levers, and operating at right angles to the said bars, substantially as described.

64,938.—WILLIAM B. BEMENT, Philadelphia, Pa.—*Lathe.*—May 21, 1867.—The pulleys are placed on the overhanging mandrels, and their peripheries turned off by the tools in the slide rests, which, in addition to their traversing motion, have an automatic movement toward and from the mandrels, to round the faces of the pulleys.

Claim.—First, the combination of the spindle C, its two overhanging ends, driving wheel or pulley F, and bearings B B, the whole being arranged substantially as and for the purpose herein set forth.

Second, the combination of the said spindle and its two overhanging ends with the bed *b*, carrying two slide rests, when the said spindle can be adjusted from and towards and in a direction at right angles to the said bed *b*.

Third, the said spindle C, its adjustable bearings B B, and its cog wheel F, in combination with the adjustable arms I I, and the gearing herein described, or its equivalent.

Fourth, the combination of the two slide rests, the two screw shafts *m* and *m'* for operating the said rests, the driving pinion *n*, and the two clutches *p* and *p'*.

64,939.—JOHN M. BILLHOFFER, Irvington, N. Y.—*Life Preserver.*—May 21, 1867.—The elliptical frame has a hood to cover the head and shoulders when required, and a bag to receive the person in a sitting position. The hood has an air pipe and window, and when down the navigator may work the oars.

Claim.—The double cone-shaped frame A, provided with the bag B and jaws C, substantially as and for the purpose shown and described.

64,940.—WILLIAM E. BIRD, New York, N. Y.—*Oscillating Engine.*—May 21, 1867.—The steam passes through the trunion, but is directed by an ordinary

slide valve with a fixed seat, the valve rod being actuated by an eccentric on the crank shaft.

Claim.—The combination in steam or other oscillating engines, with the truion of the engine cylinder of a reciprocating slide valve working against a fixed or stationary seat, and operating to control the ports or passages of the engine, substantially as described.

64,941.—G. W. BOWLBY, Pontiac, Mich.—*Combined Back Sight and Cartridge Retractor for Firearms.*—May 21, 1867.—The attaching screws of the sight traverse slots in the same to allow its backward movement to retract the cartridge shell by a claw which engages the flange of the shell.

Claim.—The sight F, constructed and used in combination with the barrel A, for the purpose of forming a sight and retractor at the same time, substantially as specified.

64,942.—CHARLES BRIED, Newark, N. J.—*Carriage Trimming.*—May 21, 1867.—The tubular rubber sockets and sleeves are made for attachment to the tongues, thills, bows, and whiffletrees.

Claim.—Rubber or gutta-percha tubes, sleeves, or rings, or compounds of gum elastics, when made and used in the forms and for the purposes herein above designated.

64,943.—ALBERT BROWN, Troy, N. Y.—*Heating Stove.*—May 21, 1867.—The stove top has a circular opening through which a covered oven is let down; a rack in the oven sustains articles to be cooked, and a hole in its bottom plate receives a kettle, or permits the passage of the fuel into the basket beneath. This hole has an ordinary stove cover.

Claim.—In connection with the combustion chamber of base-burning stoves, the arrangement of a fuel reservoir or supply-chamber C, directly under an oven B, substantially in manner as herein described and for the purpose set forth.

64,944.—DARIUS C. BROWN, Lowell, Mass.—*Warp Eye of Wire Heddles for Loom Harness.*—May 21, 1867.—The end angles of the heddle eyes are rounded out to prevent catching of the warp in the same.

Claim.—An improved heddle eye, made substantially as described, that is, of wires or parts of a wire twisted together and subsequently spread laterally at the angle or angles of junction, in manner substantially as set forth, so as to tighten the twist at either or both ends of the eye, as and for the purpose as hereinbefore explained.

64,945.—JOHN A. BURCHARD, Beloit, Wis.—*Gate.*—May 21, 1867.—The gate is operated by the ends of the counterbalancing weights; by withdrawing the spring catch the gate is lowered into the vault by its own gravity.

Claim.—An improved farm and carriage gate when constructed and operated substantially as set forth and for the purpose specified, in combination with the vault O O, weight C, lever D, pulleys E E, tracks Q Q, cords e f, latch b, pulleys H H, posts A A G G, and platform P.

64,946.—CHARLES BUTTERWORTH, Miamisburg, Ohio, assignor to himself and JACOB KERCHER.—*Lifting Jack.*—May 21, 1867.—The lever is connected to the extension upright, and rests on the movable fulcrum attached to the post. The spring catch enters holes in the extension piece to retain it in position.

Claim.—The combination and arrangement of the uprights A and B, the lever E, with its fulcrum roller n, and the supporting pieces F, constructed substantially as described and for the purpose specified.

64,947.—THOMAS J. CHUBB, Brooklyn, N. Y.—*Apparatus for Accumulating and Reclaiming Heat.*—May 21, 1867.—The gas and air are heated separately before their admittance to the mixing and combustion chamber. The devices are stated in the claims.

Claim.—First, the employment in a chamber or chambers of a series of tubes arranged in such manner that the exterior surfaces of said tubes are exposed to or are in communication with the waste heat passages in the chamber in which said tubes are ar-

anged, and the space or passages between the tubes in said chamber are in communication with the chamber of combustion, and also to and with the passages leading to the chimney, and the interior of said tubes or passages therethrough are in communication with a separate chamber or passage leading from the gas-generating furnace to and through the interior of the said tubes to the chamber of combustion, when the foregoing is combined with substantially a similar chamber, series of tubes, spaces, passages, and communications, the interior of such latter series of tubes being in communication with the passage leading from the open air to and through the interior of said tubes to the chamber of combustion, substantially as described.

Second, the combination in or with a gas-generating furnace of a chamber or chambers containing a series of tubes, made hot by the waste heat produced by the combustion of gas and air heated in these passages as separate currents to the place of combustion in a direct or continuous manner by opposite surface action or passage of the heat through the material of which said tubes are composed, substantially as described.

Third, the employment of a series of tubes so arranged that they may be heated by the products of combustion, produced by the mingling together of heated air and gas, when said air and gas have been heated by heat communicated through the material of which the said tubes are composed, substantially as described.

Fourth, the employment of a chamber or chambers containing a series of tubes so arranged as to present an extensive caloric absorbing surface, and conducting heat through the material of which said tubes are composed, and communicating it to and heating a current or currents of air and gas or gases passing on or over the opposite side of the said tubes.

Fifth, constructing chambers with a series of tubes for the entrance of continuous currents of air and gases for supporting combustion in a separate chamber, which currents are heated by waste heat or the products of combustion of such heated currents passing in opposite directions, or nearly opposite directions, and on opposite sides of said tubes, and through the material of which they are composed, for the purposes specified.

Sixth, making provision for heating air and reheating gas in their passage to a chamber of combustion by the heated products resulting from combustion in said chamber, when said gas, air, and heated products flow through their respective passages without requiring reversal, substantially as specified.

64,948.—ADRIAN CORNELL, Newton, Pa.—*Combined Grain Thresher and Cleaner.*—May 21, 1867.—The grain and straw pass from the threshing cylinder to the double vibrating shaker where the straw is removed, the grain and chaff falling to the winnowers beneath; the blast from the fan assists in each operation.

Claim.—First, the combination substantially as described of the threshing cylinder, the double vibrating shaker, the fan, and the shaking shoe, when arranged for joint operation, as set forth.

Second, the detachable shoe frame R, constructed and arranged as described.

Third, the combination of the shaker, the shaking hopper, and the riddle, arranged for joint operation, as described.

Fourth, the combination of the driving shaft and pulleys with the cylinder shaft and pulleys and the pulleys on the fan shaft, arranged and operating as described, for the purpose of adapting the machine to use with either an undershot or overshot horse-power, without crossing the belts.

64,949.—CHARLES CROW, Onango, Ill.—*Lifting Jack.*—May 21, 1867.—The claw-steps on the lower ends of the racks engage the sill, and the windlass cord is attached to an under girthing chain of the building. The racks are operated by spur wheels on the cord drum, so as to act with unanimity.

Claim.—First, the arrangement and combination of the movable steps I, racks D, and guides B C, when constructed to operate substantially as and for the purpose set forth.

Second, the combination of the roller H, rope E,

pulley J, inner guides C, and drum *v*, when arranged substantially as and for the purpose described.

64,950.—FRANCIS DANZENBAKER, Bridgeton, N. J.—*Churn and Pump Power.*—May 21, 1867.—An arm from the pendulum shaft is connected to the pump rod and another pendulum on the shaft of the pump rod arm is the means of working the churn dasher.

Claim.—The pendulums B and K and their attachments, lug C, shaft D, and arms G and F, when arranged to operate both a churn and pump, either separately or combined, substantially as set forth.

64,951.—JONATHAN DEARBORN, Seabrook, N. H.—*Machine for Applying Animal Power.*—May 21, 1867.—The endless wheel track is operated by animals; a train of gearing connects with the driving wheel, which is attachable by belt to other machinery.

Claim.—The combination and arrangement of the inclined shaft A, the wheel C, the guard E, and the platform G.

Also, the combination of the shaft A, the wheel C, the guard E, the fender D, and the platform G.

Also, the combination of the beveled gears H I, the shaft K, the shaft A, the wheel C, the guard E, and the platform G, the whole being arranged so as to operate as specified.

64,952.—L. DE FOREST, Birmingham, Conn.—*Hoop for Skirts.*—May 21, 1867.—Explained by the claim.

Claim.—Protecting the hoops of hoop skirts by a succession of metallic clasps or spangles, in the manner and for the purpose substantially as herein set forth.

64,953.—CHARLES DISSTON, Philadelphia, Pa.—*Saw.*—May 21, 1867.—The key occupies counterpart recesses in the tooth and the edge of the socket in the saw blade; the seats of the blocks on the ends of the key fit on ridges in the respective portions, being retained in position by the force of the spring which forms the bow of the key.

Claim.—An elastic detachable forked key C, constructed and adapted to the retention of a detachable saw tooth, substantially as specified.

64,954.—HENRY DISSTON, Philadelphia, Pa.—*Treating Steel Blades, &c.*—May 21, 1867.—Steel blades while yet hot from the tempering are condensed and straightened by impact or pressure.

Claim.—The within-described mode or process of treating blades or other thin pieces of steel, that is to say, straightening and condensing them by impact or pressure immediately after they have been reduced to the desired temper, and while they are still hot, as described.

64,955.—L. DORMAN, Worcester, Mass.—*Carriage Wheel Hub.*—May 21, 1867.—The wooden center piece of the hub is driven into the metallic shell, whose internal longitudinal fins fit into grooves in the wooden core; sockets in the shell receive the spokes.

Claim.—First, the combination of the grooved wooden part A with the metal shell B, substantially as and for the purposes set forth.

Second, the combination of the grooved wooden center or core A and the spokes E with the slotted or metal shell part B, substantially as and for the purpose set forth.

64,956.—ISIDORE DREYFUS, New York, N. Y.—*Automatic Lubricator.*—May 21, 1867.—The duct from the cup to the journal is occupied by a loosely fitting pin with a flattened end, the agitation of which by contact with the journal aids the flow of oil.

Claim.—An automatic lubricator, constructed to be applied as described, provided with a loose rod or dasher, set in motion by the journal for conducting the lubricating material thereto, substantially as specified.

64,957.—SIMON DRUM, Alleghany City, Pa.—*Sash Pulley.*—May 21, 1867.—The sheave *c* is held between two plates, which have counter projections and depressions on the edges of their incurved ends, and side perforations for reception of the sheave pivots.

Claim.—A shell for a sash pulley, said shell being made in halves and without a face piece, and so ar-

anged that the openings for the screws are divided by the line of separation between the halves of said shell, whereby one half of each opening for the screws is cast in the ends of each half of the shell, the whole being constructed, arranged, and operating substantially as herein described and for the purpose set forth.

64,958.—STEPHEN W. EATON, Farmington, Me.—*Support or Bearing for Friction Rollers.*—May 21, 1867.—For supporting railway carriages on their trucks. Device explained by the claim.

Claim.—The box A, constructed substantially as specified, viz: with the elongated recesses or notches *a*, to receive the journals of the roller B, and so made as to enable the roller to rest on the base plate *c* of the box, and roll thereon a short distance in either direction from the middle of the plate, as described.

64,959.—HENRY FAYETTE, Port Chester, N. Y.—*Wooden Pavement.*—May 21, 1867.—The sections are made of wooden blocks bolted together, and the sections are locked together to form a pavement. The outer blocks of each section are longest, and becoming imbedded in the earth prevent rocking.

Claim.—First, the sections of pavement composed of a number of wooden blocks, bolted together longitudinally and transversely, substantially as described.

Second, in sections of pavement composed of wooden blocks, bolted together as described, making the blocks in the outer tier of each section longer than the central blocks, as and for the purpose described.

64,960.—HENRY FAYETTE, Port Chester, N. Y.—*Wooden Pavement.*—May 21, 1867.—Wooden blocks are bolted together in sections by through rods running transversely to each other. The sections are united by tongues and grooves.

Claim.—First, locking together sections of wooden pavement by means of tongues and grooves, so arranged that each section will be supported by every adjoining section, substantially as described.

Second, sections of pavement, composed of wooden blocks bolted together as described, and provided with tongues and grooves so arranged that when laid down in a pavement each section will be locked with all the adjoining sections by means of said tongues and grooves, substantially as described.

64,961.—JOHN C. FISH, Barnstable, Mass.—*Device for Lubricating Wheels, &c.*—May 21, 1867.—The reservoir is secured to the hub of the wheel, and a pipe furnishes the oil through an opening in the hub and box, when air is supplied to the chamber; the partial vacuum at other times retains the oil.

Claim.—A lubricating apparatus constructed of a reservoir, in which is located the tube *c*, provided with openings as described, and with a perforated movable tube *i*, operating substantially as described.

64,962.—JOSIAH FOSTER, Sandwich, Mass.—*Marine Furniture.*—May 21, 1867.—The ends and bottom boards of the sofas are matched by tongue and groove and packed by intervening rubber strips. The sections are clamped and bolted together, and the cross seats strengthen the attachment.

Claim.—A construction of movable furniture for vessels, so that by means of packed joints, arranged and operating as set forth, it can be transformed into boats, substantially as described.

64,963.—THADDEUS FOWLER, Seymour, Conn., assignor to THE FOWLER NAIL COMPANY, New Haven.—*Machinery for Making Nails.*—May 21, 1867.—The blanks are fed in a continuous rod, with projections for two heads at intervals. It first passes between the grooved segments of two rollers, being fed by corners of said segments engaging the head projections, and then between transverse and oblique cutters, which sever the rod at the head and point respectively.

Claim.—First, moving the rod of blanks forward, and adjusting successively each blank to its proper position before the dies bite upon it, by means of the lateral fingers *o s*, arranged and operating in the manner herein described.

Second, combining with devices for feeding the nail blanks, the two pairs of cutters *h* and *vi*, *l* and *n*, arranged substantially as described.

Third, the combination of the cutters *h* and *m*, *l* and

n, with the rollers *d* and *e*, formed with cam-shaped surfaces *t* and flanges *o* and *s*, as and for the purposes specified.

64,964.—THADDEUS FOWLER, Seymour, Conn., assignor to THE FOWLER NAIL COMPANY, New Haven.—*Machine for Making Horse-shoe Nails.*—May 21, 1867.—Nail blanks prepared on a machine described in patent No. 64,963, are dropped in the notches of an annular disk intermittently rotated by a pawl. Shanks protruding from the periphery of the disk are first pressed edgewise, then sidewise, and then the point is sheared to form. A reciprocating file gives the side bevel to the point.

Claim.—First, the jaws *n n*, fitted and actuated substantially as specified, to straighten the nail by pressure on its edges, as set forth.

Second, the die *p* in combination with the carrier plate *h*, for acting upon the side of the nails as brought around successively, as specified.

Third, the cutter *q* in combination with the carrier plate *h*, for clipping off the nailpoints as successively presented by said carrier plate *h*, as set forth.

Fourth, the spring friction plate *t* in combination with the carrier plate *h*, and a file for removing the side of the point, substantially as specified.

64,965.—JOHN A. FREY, New York, N. Y.—*Lamp Burner.*—May 21, 1867.—The lower chamber of the burner has a circle of apertures, and is divided by a perforated diaphragm from the upper chamber, which is crowned by a conoidal frustum cap.

Claim.—The combination of the air chambers *f* and *g* with the air inlets *d* and *d'* and perforated diaphragm *c*, arranged and operating as and for the purpose set forth.

64,966.—E. R. GARDINER, Brooklyn, N. Y.—*Machine for Sizing and Felting Hats.*—May 21, 1867.—The endless belt is carried around drums. The lower portion of an inclined adjustable vat bed forms a hot water battery; the rolls alternate between the sizing surface and the hot bath. The vat bed rests on spiral springs to give elasticity or a gentle vibratory action.

Claim.—The combination with the inclined endless belt or apron *C* of the inclined adjustable or self-adjusting partly submerged bed *F*, and box or bath *A*, substantially as and for the purpose or purposes herein set forth.

64,967.—T. ELZARE GARDINER, Jr., Bryantown, Md.—*Gang Plow.*—May 21, 1867.—The two gang plows on each side bar of the frame throw the furrows into a ridge; drags and rollers follow the plows.

Claim.—A gang plow, constructed and operating in the manner substantially as shown and described.

64,968.—GEORGE D. GARVIE, Hartford, Conn.—*Guide for Sewing Machines.*—May 21, 1867.—The spring arm holds the cloth upon the plate and determines the edge towards the face of the guide, which is adjustable on the cloth plate of the machine.

Claim.—The adjustable gauge *B*, in combination with the spring arm *a*, both being constructed and arranged as described.

64,969.—J. C. GASTON, Cincinnati, Ohio.—*Atmospheric Churn Dasher.*—May 21, 1867.—The hollow dasher has a perforated tubular handle, through which air is introduced into the cream.

Claim.—The tubular handle *A*, provided with the perforation *b*, near the upper end *a*, in combination with the dash board *c*, having the annular concavity *c'* in its lower face, all constructed and operating substantially as herein described and for the purpose set forth.

64,970.—A. E. GRAHAM, Richland, Ind.—*Bride Reins.*—May 21, 1867; antedated November 21, 1866.—The continuous reins extend from the check hook through the gag runners and bit ring to the driver's hand.

Claim.—The continuous reins *A A*, passing through pulleys on the ends of the bit, and also through pulleys each side of the gag rein, and around the terret or check hook, being tacked together, (as seen at *x*) or prevented by a keeper from sliding through said check hook, substantially as described and for the purposes herein specified.

64,971.—ADELBERT W. GRAY, Bennington, Ohio.—*Churn.*—May 21, 1867.—The break attached to the bottom is deeply cleft to increase the agitation. The beater shaft is rotated by an endless band and driving wheel.

Claim.—The special arrangement of the break *C*, in combination with the beater *H*, when operated conjointly in the manner and for the purpose set forth, by means of the band *I*, pulley *K*, and wheel *J*.

64,972.—WM. D. GRIMSHAW, Newark, N. J.—*Reciprocating Engine.*—May 21, 1867.—The steam enters the cylinder through axial passages which receive the end projections of the piston, forming dash pots.

Claim.—The combination with a reciprocating piston of a cushioning attachment, operating as a sliding or movable plug to the port or ports of the cylinder, substantially as specified.

64,973.—C. H. HALL, Binghamton, N. Y.—*Bed Bottom.*—May 21, 1867.—The slats are attached by wires to fixed screws in the frame. The wires pass from the upper sides of the screws to the under sides of the cylindrical ends of the slats, and have three or more coils around them.

Claim.—The arrangement of a series of springs *C*, each having three or more coils, which are placed on pins *D* and on the end of the slats *B*, substantially in the manner and for the purpose shown and described.

64,974.—H. G. and E. L. HALL, Putnam, Ohio.—*Plow.*—May 21, 1867.—The share edge and point are detachable for removal when worn.

Claim.—First, the detachable side plate *B* of the plow point *A*, substantially as and for the purpose specified.

Second, the cutting point *C*, composed of a wrought-iron shank *e* and a cast or chilled-iron cap *c'*, substantially as and for the purpose described.

Third, the method above described of attaching the side plate *B* to the plow joint *A* by means of shouldered pins *b' b'* projecting from the side plate *B* into slots in the body of the plow point, where the shoulders of the pins rest on ledges or keys in the walls of the slots, substantially as and for the purpose specified.

Fourth, the method of attaching the shank *c* to the plow point *A*, above described.

Fifth, the independent cutter or colter *H*, substantially as and for the purpose described.

Sixth, the construction of the cutting point *C* and the groove or bed *a*, as above described, so that the cutting point may be self-sharpening, substantially as and for the purpose specified.

64,975.—WM. I. and J. W. HARRIS, Newport, N. Y.—*Door Lock.*—May 21, 1867.—The bolt is actuated by an eccentric which is connected to a cylinder having a keyhole into which the tumbler keys project; these slide radially in the cylinder and about on similarly-sized spring pins in the hub. The key is of proper form to adjust the tumbler pins so that their ends shall coincide with the periphery of the cylinder and allow its rotation in the hub.

Claim.—First, in combination with the key for arranging the tumblers, the eccentric or slide for moving the lock bolt, substantially as described.

Second, in combination with the slide, the stops against which it impinges, or brings up at the exact point in both the locked or unlocked positions for the admission and withdrawal of the key, substantially as described.

64,976.—H. A. HARVEY, New York, N. Y.—*Window-sash Weight.*—May 21, 1867.—The sheet-metal case is fitted with an anchored ring at top, and filled through the bottom with heavy comminuted iron ore and cement.

Claim.—The new article of manufacture herein described, namely, a sash weight, composed of a metallic case filled with iron ore and cement, manufactured as herein set forth.

64,977.—BIRDSILL HOLLY, Lockport, N. Y.—*Turbine Water Wheel.*—May 21, 1867.—The vertical driving shaft has a disk which forms the cap of a chamber to which water is admitted from the flume, to sustain by water pressure any part, or the whole weight, of the wheel and shaft.

Claim.—Sustaining turbines and other wheels by means of a water chamber H and disk F resting directly upon the sides thereof, both surrounding the step and shaft of the wheel when supplied with water from the flume, and proportioned to the height thereof, substantially as set forth.

Also, in combination with said device, the supply pipe I, arranged for receiving the water from the outside of the stop gate J, substantially in the manner and for the purpose set forth.

64,978.—J. HOUGHTON, New York, N. Y., and G. WINGFIELD, Brooklyn, N. Y.—*Device for Perforating Cigars.*—May 21, 1867.—The exterior sleeve moves the rear plate to which the needles are attached and projects them into the cigar; the recoil spring retracts them.

Claim.—First, the combination of the needles a, head A, casing B, spiral spring b, ring d, and piece C, substantially as and for the purpose set forth.

Second, the combination of the head A and needles a a with the casing B, substantially as and for the purposes set forth.

Third, the combination with the head A and needles a a of the conical piece C having a trumpet-shaped or conical opening in it, substantially as and for the purpose specified.

Fourth, the combination with one or more needles a a, head A, and casing B of the spiral spring b, substantially as and for the purpose set forth.

64,979.—WILLIAM G. HUGHES, Hebron, Ind.—*Broom Head.*—May 21, 1867; antedated May 8, 1867.—The metallic head and ferrule are braced by curved wires running through the sliding joint, through which also passes the spring band encircling the brush.

Claim.—First, the combination of the wire braces I and J with the parts A and B and with the brush of the broom, substantially as described and for the purpose set forth.

Second, the combination of the spring or bracing wires M and N with the wire braces I and J and the brush P, substantially as described and for the purpose set forth.

64,980.—W. W. HUSE, Brooklyn, N. Y.—*Tobacco Cutting Machine.*—May 21, 1867.—The annular cutter is adjustable circumferentially on the periphery of its eccentric disk to bring fresh portions of the edge into action. The inner face of the cutter is concave to prevent trouble from slight gumming. Scrapers and sharpeners act on the cutter during use.

Claim.—Arranging or hanging the circular cutter eccentrically upon its shaft, so that only a portion of its cutting edge is at one operation brought into action on the tobacco or other material to be cut, and when desired, can be shifted on its shaft to bring another portion of its cutting edge to act on the substance to be cut, as described.

Also, making the cutter for a short distance from its periphery or cutting edge inclining outward from its plane of motion, as herein described, in combination with the method of hanging the cutter eccentrically and so that it can be shifted on its shaft, as described.

Also, in combination with the eccentric cutter, the employment of a sharpener and wiper, arranged substantially in the manner and for the purpose set forth.

64,981.—HENRY HUTCHISON, Three Rivers, Mich.—*Seeding Cultivator.*—May 21, 1867.—Explained by the claims and illustration.

Claim.—First, the reversible cross-shaped marker O, constructed, arranged, and operating as described. Second, the reversible rhomboidal spades R, constructed, arranged, and operating as described.

Third, the reversible winged covering plows U, constructed, arranged, and operating as described.

Fourth, adjusting and holding the shades upon the legs or shovel stocks by means of the hinged clamps and set screws, constructed and arranged as described.

Fifth, the combination of the hinged slotted legs with the pivoted drag bars having hooks on their rear ends to pass through the slots and be held by wooden pins behind the legs, when constructed and arranged as described.

Sixth, the combination of the marker and front plows with the shifting bar P, shifting lever P', and

driver's seat, when arranged for joint operation, as set forth.

Seventh, the combination of the legs with their supporting beams by means of the laterally-adjustable sockets, forks, lugs, and set screws, constructed, arranged, and operating as described.

Eighth, the combination, substantially in the manner described, of the front and rear plows, mounted on opposite ends of levers pivoted to rock transversely to the axle to relieve the strain on the plows caused by inequalities in the surface of the ground.

Ninth, the combination of a series of front and rear plows with longitudinal rocking levers fulcrumed on transverse levers so connected at their inner ends that the levers can simultaneously be raised or lowered by the driver or be held in any position desired.

Tenth, the combination of the covering plows attached to the beam suspended from the rear end of the rocking levers with the lateral vibratable front plows suspended from the front end of the rocking levers.

Eleventh, the combination of the lifting levers, sliding bar V, and detent v, when arranged in relation to the driver's seat, substantially in the manner described.

Twelfth, the arrangement of the adjustable driver's seat, arched bar, and adjustable back brace, as described.

Thirteenth, the arrangement of the hoppers E' and F as and for the purpose described.

Fourteenth, the combination with the feeding hopper E' of the reciprocating teeth m and rubbers m', for the purpose of separating the seed.

Fifteenth, the combination with the lower hopper of the reciprocating toothed feeding slides.

Sixteenth, the vertically-reciprocating gates J, arranged and operating as described.

Seventeenth, the combination, substantially in the manner described, of a hopper, a horizontally-reciprocating toothed slide, and a vertically-reciprocating gate.

Eighteenth, the combination of the hopper, the reciprocating slides, the feed spout, and the marker, for the purposes set forth.

64,982.—ALFRED IVERS, New York, N. Y.—*Stationary Wash Basin.*—May 21, 1867.—The basin has a pendant flange on the interior and a waterway between the flange and the basin communicating with the overflow pipe; the entrance to the latter is higher than the slot, so that the water covers the slot before overflowing.

Claim.—The pendant flange d and slot e, in combination with the dam f and pipe g, substantially as and for the purposes specified.

64,983.—HEBER G. IVES, Durham, Conn.—*Sheep Rack.*—May 21, 1867.—Roots emptied into the rack divide equally to each trough.

Claim.—First, pivoting the hay rack of a sheep-feeding device so that by adjusting or turning the same, the trough beneath may be exposed to facilitate cleaning, substantially as described.

Second, the combination with the rack C C of two troughs F F, having their contiguous inclined sides joined together at top at an angle for the purpose of distributing the grain or roots, substantially as set forth.

64,984.—LUMAN A. and GEORGE J. JONES, Barrington, N. Y.—*Harvester.*—May 21, 1867.—An upper reciprocating cutter removes the head or bolls of the plants while the lower cutter mows at the usual height. The seed falls into a trough attached behind the upper finger bar.

Claim.—The arrangement of the several parts B C D E G J K L and M, when made and applied as and for the purposes herein specified.

64,985.—JACOB L. KINTNER, Harrison county, Ind.—*Harvester Pitman.*—May 21, 1867.—The wrist of the pitman is journaled between two grooved blocks which are enclosed in a frame and keyed up to prevent rattling.

Claim.—The grooved adjustable journal boxes B B, frame A, and packing E F, combined and arranged with the cutter bar D, pitman E, and wrist pin C, in the manner and for the purposes herein specified.

64,986.—GEORGE B. KIRKHAM, New York, N. Y.—*Organ*.—May 21, 1867.—Designed to change the pitch a half or full tone, or more. The key and hammer sticks are jointed and connected together by pivoted sticks overlapping the joint, and these connecting sticks are moved by a bar pivoted to them; this bar is connected by an adjustable rod, segmental gear plate, and gear wheel, to a scale disk to indicate the movement.

Claim.—First, the connections *a a*, their nuts, screws, and blocks *d e*, together with their pin screws, and little ball supports *c*.

Second, the lips *f f*, and their guides *g g*.

Third, the spring catch *h*, and its attachments *i j k l m n* and *o*, including the arrangement *p* and *q*.

Fourth, the bar *b*, and its supports *b' b'*, as shown and set forth.

Fifth, the combination *s r t u v*, as described and represented.

Sixth, the peculiar hinge joint made by the sticks *T Y* and *Z*, with little pins passing through the sticks.

64,987.—ALBERTUS LAROWE, Cohocton, N. Y.—*Gate*.—May 21, 1867.—The latch is raised from the notch when the gate is raised upon its rabbets. It is then drawn to the center stay and swung 90°, resting on the roller.

Claim.—The combination and arrangement of the gate, as herein described, with the post *C*, having the rabbets *e e*, and roller *g*, and post *B* with slot and catch *t*, in the manner and for the purposes set forth.

64,988.—JOHN LE FERRE, Charlestown, Mass.—*Window-sash Elevator*.—May 21, 1867.—The hinged clamp is attached to the sash by a transverse thumb screw. Its pintle has an upper and lower eye for attachment of the operating cords.

Claim.—The hinged plate *C* with its projections *a*, eyes *e d*, and screw *D*, in combination with the block *G*, provided with the screw thread *f*, and carrying the pulley *e*, substantially as and for the purpose set forth.

64,989.—L. PAUL JUVET, Glenn's Falls, N. Y.—*Time Globe*.—May 21, 1867.—One arbor of the globe has the hand-bearing cylinders and the other operates as a key to wind up the watch works.

Claim.—First, the axis of the globe *A*, when constructed of the two sections *F* and *F'*, the former serving as an axis for the hollow arbors *o* and *p*, carrying the hour and minute hands *d* and *b*, and the latter serving as a winding arbor, constructed, arranged, and operating in the manner substantially as shown and described, and for the purpose set forth.

Second, the combination of the dial *D*, globe *A*, and the chronometer movement within the same, arranged, constructed, and operating in the manner substantially as shown and described and for the purpose set forth.

64,990.—JOSEPH LLOYD MARTIN, Baltimore, Md.—*Ageing Alcoholic Liquors*.—May 21, 1867.—The raw liquor is placed in a tank, and by means of a pump is drawn up and passed through a copper return pipe containing a series of gauze sieves. During this process it is subjected to a current of electricity and to heat.

Claim.—First, the process herein described for changing, altering, and modifying whiskey, brandy, gin, or other alcoholic liquors, so as to give them the character and quality of similar liquors as usually acquired by long keeping.

Second, the combined action of heat, electricity, and attrition, so as to modify and change alcoholic liquors, substantially as herein described.

Third, the combination of an electric battery, pump, and tanks, or their equivalents, so as to treat alcoholic spirits, substantially as herein described.

64,991.—EBENEZER MATHERS, Eldersville, Pa.—*Sheep Shears*.—May 21, 1867.—The teeth of the cutters are double edged. The cutter plates are connected by a screw which is secured to one plate and traverses a slot in the other plate. The spring has one or more coils.

Claim.—First, making sheep shears with reversible blades for cutting or clipping, whether each blade or set of blades be made in one piece or in two

or more pieces, substantially in the manner and for the purposes above set forth.

Second, the mode of attaching the handles *a a'*, of a pair of sheep shears by a spiral or coiled spring *b*, so as to admit of their easy operation, such spring possessing sufficient rigidity to cause the return stroke of the blades, substantially as and for the purposes hereinbefore set forth.

Third, securing a more or less intimate contact between the opposite blades or sets of blades of a pair of sheep shears, by a set screw passing through a slot in one of the blades or the plate to which such blade is attached, and screwing into the other, substantially as and for the purposes above described.

64,992.—DAVID MATHEW, Prairie du Chien, Wis.—*Instrument for Preventing Incrustation of Steam Boilers*.—May 21, 1867.—Scraps of copper and zinc are enclosed in a case and placed in a boiler to remove scale by magnetic action; if the boiler be of copper, zinc alone is used.

Claim.—The employment within the boiler or cage or case, containing metallic scrap, substantially as described.

64,993.—T. A. McFARLAND, Meadville, Pa.—*Steam Heating Apparatus*.—May 21, 1867.—The top of the fire chamber is domed and has vertical, blind pipes extending into the water space above. Above the water chamber is a steam chamber which is connected to the former by steam and return water pipes, and has a safety valve in its crown sheet which separates it from an upper chamber from whence the steam may be conducted for heating purposes. These chambers are enclosed in a shell leaving an annular space for passage of the caloric current.

Claim.—First, the combination, substantially in the manner described, of the fire chamber, the water chamber, and the steam chamber, with the casing or body of the stove, for the purposes set forth.

Second, connecting the water and steam chambers by the steam and waste water pipes, arranged as described, for the purpose set forth.

Third, the valve *F*, arranged to operate as a safety valve for the boiler, and as a return valve for the condensed waste steam, as described.

64,994.—SAMUEL McLAUGHLIN, Philadelphia, Pa.—*Brick*.—May 21, 1867.—The horizontal faces and the ends of the bricks are grooved and ridged so as to form a bond with the other bricks in the wall.

Claim.—Bricks having ribs and grooves arranged substantially as and for the purpose herein set forth.

64,995.—WILLIAM HARTLEY MILLER, Philadelphia, Pa.—*Manufacture of Packing for Stuffing Boxes of Steam Engines, Pumps, &c.*—May 21, 1867.—A bundle of jute yarn is drawn through powdered soap stone, it is then passed through melted paraffine, then braided with fine cotton yarn, and passed again through the paraffine.

Claim.—The combination of these materials in a packing for engines, pumps, &c., in the manner shown and described.

64,996.—ADAM MINNIS, Canton Township, Mich.—*Potato Digger*.—May 21, 1867.—Knives precede to cut the vines. The shears raise the tubers, and the armed rollers agitate them to remove the earth. The rollers are worked by band and gearing from the driving wheel.

Claim.—First, the whole combination of the machine, for the use and purposes named.

Second, as new, the shears *A A*, &c., five or more, in shape and manner of adjustment.

Third, as new, the flexible knives *E E*, &c., in the manner of their adjustment.

64,997.—PARKER MOODY, Gloucester, Mass.—*Hawse Pipe*.—May 21, 1867.—A roller in the throat and one in the bed of the pipe assists the traverse motion of the hawse, which is drawn through it.

Claim.—The arrangement and combination of the auxiliary concave roller *D*, and its chamber *b*, with the hawse pipe *A*, its oblique mouth-piece *B*, and the concave friction roller *C*, arranged in such mouth-piece, substantially as specified.

Also, the combination and arrangement of the

dovetailed plates *d d*, and recesses *e e*, with the hawse pipe and its auxiliary roller *D*, and roller chamber *b*, as described.

Also, the construction of the roller chamber, with discharging passages *f g h*, leading therefrom and communicating as described.

64,998.—CHRISTIAN C. MUSSELMAN, Somerset, Pa.—*Combined Press for Cheese and for Other Purposes.*—May 21, 1867.—The plunger lever presses the cheese or frits in the perforated cylinders. The sausage stuffer is a close cylinder, with projecting pipe, and is operated by the same lever.

Claim.—The arrangement of the lever *d*, winch *f*, platform *a*, and rings and cylinders *l i k m o*, in the manner and for the purposes set forth, the whole forming a press adapted to domestic uses.

64,999.—JOSEPH and GEORGE HENRY NEEDHAM, London, England, assignor to JAMES GRAHAM GREY, same place.—*Breech-loading Fire-arm.*—May 21, 1867.—The hinged breech block swings horizontally, is locked by a spring catch, operated by the tail piece, and has an axial firing pin, actuated by the hammer and a recoil spring. The ejector fork is operated by the swinging breech.

Claim.—The arrangement of the breech piece *i*, with its component parts, constructed and operating substantially in the manner described.

65,000.—MORTIMER NELSON, New York, N. Y.—*Machine for Making Type Molds.*—May 21, 1867.—The types are set in grooves in the periphery of a disk, rotated by a friction gear, which actuates a cylinder, geared to the disk. The types are held in their grooves by contractile springs, and advanced by a lever to impress the matrix on the bed beneath. The separate key for each letter or figure is connected to a wire, which is raised by it to enter a hole in the cylinder in the part of its revolution, when that letter is in the proper position for projection. The motion of the key automatically operates the projecting lever and bed.

Claim.—First, a wheel receiving in radial grooves movable types, in combination with a lever, and with projections on said wheel, substantially as set forth, whereby the lever that moves the type is also made to accurately adjust the wheel, and hold it while the type is being impressed, as set forth.

Second, a vertical wheel, carrying movable types placed radially, and constructed substantially in the manner specified.

Third, the barrel *C*, in combination with the type wheel *A* and keys *F*, substantially as and for the purposes set forth.

Fourth, the feed wheel *Z*, rack *A*, beds *S'* and *S*, constructed and operated in substantially the manner and for the purposes set forth.

Fifth, the spacing block *E*² and its actuating mechanism, applied substantially in the manner and for the purposes set forth.

Sixth, the lever *W*, in combination with the spacing block *E* *S*, and feeding mechanism, substantially as specified.

Seventh, a contractile band to draw the type back to place in the type wheel, as set forth.

65,001.—ELIJAH R. OSGOOD, Columbus, Ohio.—*Shingle Machine.*—May 21, 1867.—The bolts are clamped between fixed and movable dogs in a circular series of spaces in a horizontally rotating table. The bolts are automatically released by an eccentric, moved forward to the tilting table, which is oscillated by a cam to make butts and points, and then gripped and fed forward to the circular saw.

Claim.—First, the manner shown and described of constructing the movable dogs of two parts *e e'*, jointed together, and held so by a plate, substantially as described.

Second, the arrangement of the tripping toe *k* and a spring arm *j*, acting upon an oscillating shaft *h*, to which the extension arm *H'* of said table is attached, all constructed and operating substantially as described.

Third, the spring arm *j*, in combination with the rock shaft *h* and tripping toe, substantially as and for the purpose described.

Fourth, the combination of the forked arm *H'* of the bolt table *H*, oscillating shaft *h*, adjustable block *g* and saw *D*, substantially in the manner and for the purpose described.

Fifth, the arrangement of the wheels *a a*, internally toothed plate *A A'*, spur wheel *C*, shaft *C'*, saw and shaft *D'*, belt *b*, central shaft *E*, cam *c*, retractor *I*, dogs *e e*, curved way *G*, spring arms *d d* and pivoted table *H*, all constructed and operating substantially in the manner described.

Sixth, the arrangement of the circular internally-toothed plate *A A'*, oscillating bed *H H'*, saw *D*, cam *c*, retractor *I*, dogs *e e*, spring levers *d d*, blocks *g g'*, rock shaft *h*, spring arm *j*, tripping toe *k*, loaded arm *m*, and weighted arm *l w*, all constructed and operating substantially in the manner and for the purpose described.

Seventh, a circular sawing machine, constructed and operating on the principle herein described, which is capable at the will of the operator of being made to saw stuff of equal or unequal thicknesses, substantially as set forth.

65,002.—BERNARD OWENS, St. Louis, Mo.—*Composition for Ink.*—May 21, 1867.—Hot water, 1 pint; soluble blue de Paris, 1 teaspoonful; ox-gall, 1 teaspoonful, and proof alcohol, 1 oz.

Claim.—The composition or like composition as above named and described, and for the purposes set forth or any other substantially the same for the purposes set forth, and to produce the above-named effect.

65,003.—HORATIO O. PERRY and JOHN L. LAY, Buffalo, N. Y.—*Steam Engine.*—May 21, 1867.—The lower and larger cylinder-head is cast with a supporting frame for the upper cylinder. The stuffing boxes, which may be connected by a sleeve, are accessible through this frame. The larger cylinder-head has a man-hole to allow access to the piston.

Claim.—The combination and arrangement of the shell or frame constituting the intervening chamber *K*, with the two cylinders *A* and *B*, and continuous piston rod *F*, its bottom plate forming the cover of the cylinder *B*, constructed substantially as and for the purposes herein set forth.

Also, the stuffing box, consisting of the sleeve *h* and packing box *L*, in combination with the chamber *K*, and piston *F*, and cylinders *A B*, arranged and operating substantially as and for the purposes set forth.

Also, the combination and arrangement of the man-hole *I* with the bottom plate of chambers *K*, forming the head of the cylinder *B*, whereby the adjustable ring *M* and sectional packing rings *r s* of the piston *E* may be removed, substantially in the manner and for the purposes herein set forth.

65,004.—S. POPE, Napoleon, Ohio.—*Hog Feeder.*—May 21, 1867.—The central receptacle has a large compartment, discharging at bottom into troughs on three sides; the discharge openings have wheels whose radial wings operate to keep back an over supply, but to work out the feed as they are rotated by the hogs. A smaller compartment contains liquid, and its outlet is closed by a valve hung on a spring plate, which is pushed open by the hog.

Claim.—First, the wheel *G*, as arranged in combination with the box *A* and trough *B*, as and for the purpose described.

Second, the valve *K*, as arranged and operated by the lever *L*, in combination with the reservoir *I* and trough, for the purpose and in the manner set forth.

65,005.—ALONZO W. PORTER and J. HAMILTON BROWN, New York, N. Y., assignors to ALONZO W. PORTER and JAMES S. GRAY, same place.—*Vapor Burner.*—May 21, 1867.—The retort has a lower cup with a central, vertical pipe containing the regulating valve stem. Upon the beveled edges of this cup is set the cap containing the burner and upper and lower heat conductors from the heating disk above.

Claim.—First, mounting the heater cap and conductors on a plug having a ground edge fitting into a corresponding ground surface on the top of the retort, substantially in the manner described for the purpose

of readily separating the heater cap from the retort to cleanse the latter.

Second, the combination substantially in the manner described of a locking yoke embracing the retort with a detachable plug supporting the conductors, for the purpose set forth.

Third, the combination of the retort, the central pipe, and the valve stem with the sleeve screw and yoke, for the purpose specified.

Fourth, a yoke which embraces the retort and serves both to lock the parts together and as an additional heat conductor.

65,006.—E. L. PRATT, Boston, Mass.—*Machine for Cutting Tobacco.*—May 21, 1867.—The plug of tobacco is placed in the head which is oscillated by a lever above the knife and gauge-plate. The plug is fed by its gravity.

Claim.—The swinging carrier, the cutter, and the gauge plate, when arranged together, substantially as shown and described.

65,007.—SAMUEL F. PRATT, Roxbury, Mass.—*Furniture for Vessels.*—May 21, 1867.—The bottom of the inverted life-boat is cushioned, and its keel forms a back to the double sofa.

Claim.—The combination of the seat and watertight tank, when constructed and arranged, to operate substantially as and for the purpose specified.

Also, in combination with the foregoing of one or more water-tight compartments, as and for the purpose specified.

65,008.—LUCIEN RARCHAERT, Paris, France, assignor to RICHARD and HENRY L. NORRIS, Philadelphia, Pa.—*Locomotive Engine.*—May 21, 1867.—Explained by the claims and illustration. The object is to enable the wheels to accommodate themselves to curves of short radius without serious strain on their flanges.

Claim.—First, a locomotive engine having a main driving shaft with a crank formed in the same turning in fixed bearings secured to the frame and situated between two trucks each of which has a cranked axle coupled to the said main driving shaft, all substantially as and for the purpose herein set forth.

Second, the combination of the said main driving shaft E, the cranked axles of the trucks, and coupling bar J, the several shafts and their cranks being arranged substantially as described.

Third, the bars F and F', constructed and adapted to the main driving shaft and cranked axles of the trucks, substantially as and for the purpose herein set forth.

65,009.—HENRY RENSCH, Quincy, Ill.—*Automatic Water Leader.*—May 21, 1867.—The filter has a pipe leading to the tank beneath, in which is a float connected to a spring valve in the waste pipe of the filter which carries off the overflow water.

Claim.—The spring N, in combination with the valve I, spring case P, discharge pipe J, and weight linked to the valve, all arranged substantially as described.

65,010.—EDWIN H. REYNOLDS, Rising Sun, Md.—*Lamp Heater for Vehicles.*—May 21, 1867.—The air-heating chamber communicates with the interior of the vehicle; the other chamber is occupied by the calorific current which heats the former chamber, and is then discharged outside the vehicle. Shields interrupt currents of air, and the glass pane admits the passage of light, for the driver.

Claim.—First, a casing B, having a perforated top a, side openings b, partition G, and outlets d, in combination with a detached lamp, the whole being constructed and applied to the bottom A of a vehicle, substantially as and for the purpose described.

Second, the combination of the above-mentioned casing B with a glass lamp chamber.

Third, the shields n n, arranged beneath the tubular projections d d, substantially as and for the purpose specified.

65,011.—HOLLAND M. RICHMOND, Buffalo, N. Y.—*Vapor Burner.*—May 21, 1867.—The outer transparent conoidal deflector is fixed in the inner groove of a flange having an outer groove to support a shade

or glass globe. The upper part of the burner is attached to the lower by a bayonet joint.

Claim.—First, the combination of the transparent cone or deflector A with the inner cone B of a gas generating burner.

Second, in combination therewith, the flange F with the grooves H and G, or the equivalent thereof, as and for the purposes described.

65,012.—JOHN B. ROOT, New York, N. Y.—*Traction Engine.*—May 21, 1867.—The driving wheel axle has a loose eccentric oscillated by a crank actuated through a connecting rod by an eccentric on a shaft rotated by the engine. The eccentricity of this latter eccentric is regulated by a sliding inclined block within the eccentric and upon the driving shaft. The former eccentric carries a traction sector whose arc bears against an annular flange on the inner side of the driving wheel, and which acts by friction to rotate the latter. This arrangement is duplicated, one block acting while the other is on the return movement. The blocks are swung over to reverse the engine.

Claim.—The combination of variable or adjustable eccentrics or cranks on a rotating shaft driven by the engine, with reciprocating friction blocks or devices acting upon the wheels connected with the driving shaft of a locomotive or traction engine, substantially as specified.

65,013.—JOHN B. ROOT, New York, N. Y.—*Rotary Valve.*—May 21, 1867.—The cylindrical end of the working pin, which is rigid in the rock shaft but loose in the valve, allows the accommodation of the latter to wear of the face.

Claim.—The combination with a valve the face of which moves in the arc of a circle or arcs of circles of a driving pin G, projecting radially from the valve operating rock shaft, and made cylindrical at its junction with the valve, and to loosely fit or enter a cavity in the valve, substantially as and for the purpose or purposes herein set forth.

65,014.—W. W. SANBORN, Lyons City, Iowa.—*Churn.*—May 21, 1867.—The cream runs from the hopper on to the gauze wings of the revolving dasher and from thence drips into the chamber beneath where the main dasher rotates.

Claim.—The perforated beater H, the air tube K, and the grooved bottom J, when constructed, arranged, and operating substantially as and for the purposes above set forth.

65,015.—JOHN N. SAWTELL, Chicopee, Mass.—*Sash Support.*—May 21, 1867.—The wedge block having a ribbed surface toward the sash is held in a case let into the stile, and is raised to free the sash by the curved end of a cam lever. This lever has a catch to lock the sash when closed.

Claim.—In a sash supporter the combination of the wedge C, lever E, and guide box A, the whole constructed and operating substantially as described.

65,016.—HENRY and JACOB SCHILD, New York, N. Y.—*Vented Faucet.*—May 21, 1867.—The faucet has an air passage whose valve is opened with the faucet and closed by a spring.

Claim.—The valve f at the inner ends of the channels j k, in combination with the elbow lever B and tooth c of the plug B, constructed and operating substantially as and for the purpose described.

65,017.—GOTTLIEB SCHREYER, Columbus, Ohio.—*Attaching Carriage Thills.*—May 21, 1867.—The clip lug has conical side projections which enter cavities in the thill iron. The latter is slotted obliquely forward and downward, so that the thills can be removed when in their lowest position. The bolt shank is conical and has a tightening nut on each end.

Claim.—First, the construction upon a clip strap B of a perforated lug D with a conical enlargement b b on its sides, adapted for receiving the slotted thill iron E and a bolt G, substantially as described.

Second, the construction of the clip strap B with lips c, c for holding rubber blocks d d, and also with a perforated lug D, having conical enlargements upon it, substantially as described and for the purpose set forth.

Third, the combination of the slotted thill iron E, conical lug D, and a tapering bolt G, substantially as described.

65,018.—THOMAS SHAW, Philadelphia, Pa.—*Steam-generating Gauge Cock.*—May 21, 1867.—The packing of the stem is placed in an annular score of the same. The side opening has a whistle attached.

Claim.—The construction and arrangement of the gauge valve and whistle, whereby to control the pressure and to indicate the sound produced by steam, or steam and water commingled, or water unmingled with steam, substantially as set forth.

65,019.—GEORGE B. SIMPSON, Washington, D. C.—*Insulating Submarine Cables.*—May 21, 1867.—Explained by the claim.

Claim.—The combination of gutta-percha and metallic wire in such form as to incase a wire or wires, or other conductors of electricity, within the non-conducting substance gutta-percha, making a submarine telegraph cable at once flexible and convenient, which may be suspended on poles in the air, submerged in water, or buried in the earth to any extent, for atmospheric and submarine telegraph communication and for other electric, galvanic, and magnetic uses, as hereinbefore described.

65,020.—NATHAN SIMPSON, Pomeroy, Ohio.—*Beehive.*—May 21, 1867.—Around the entrance is placed a palisade of galvanized needles so near together as to bar the entrance of miller worms. The bees enter on a pin projected through the hole from the inside of the hive.

Claim.—Applying and arranging around the entrance to the beehive needles or other sharp pointed pieces of metal, substantially as set forth, and for the purposes stated in the foregoing specification.

65,021.—HENRY SIPE, Sipesville, Pa.—*Sleigh Brake.*—May 21, 1867.—The brake dog is depressed by oscillation of the rock shaft caused by a backward pressure on the tongue.

Claim.—The rock shaft *b* and arms or elbow levers *c c*, in combination with the brake bars *d d*, and pole or tongue *a*, arranged and operated substantially as described.

65,022.—GEORGE W. SIZER, Brooklyn, N. Y.—*Toy.*—May 21, 1867.—The whistles are placed in the outer disks of the "buzz," and sound when it is oscillated.

Claim.—The combination of one or more whistles with the toy known as the buzz, substantially as herein set forth.

65,023.—E. SPENCER, Ottawa, Canada West.—*Paddle Wheel.*—May 21, 1867.—The buckets have radial pivot shafts, whose cams come in contact with the projections and depressions of the guide ring to feather the paddles so that they act broadside in the water, but come out edgewise.

Claim.—The pivoted buckets *I*, provided with the cams *b* and *h*, and arranged to operate in connection with the stationary ring *B*, having the notches *n* and projections *e* formed thereon, substantially as shown and described.

65,024.—JAMES STEWART and DAVID WINDSOR, Sandwich, Ill.—*Concrete Brick Machine.*—May 21, 1867.—The two plungers are operated simultaneously by toggle levers operated by a rock shaft, and are both connected to a yoke attached to a follower bar on which the toggle levers act.

Claim.—First, the combination and arrangement of the molds *B B*, plungers *C C*, following bar *E*, arms *H H I I*, connecting arms *L L*, and shaft *N*, substantially as and for the purposes specified.

Second, in combination with the above, the arms *F F* and lever *G*, arranged as and for the purposes described.

65,025.—JONATHAN THOMAS, Mount Union, Ohio.—*Fence.*—May 21, 1867.—Hoop iron to form trellis work or paling is wound around the horizontal rods whose ends are attached to the iron posts of inverted U-form. Springs at the attachment of the rods permit contraction, &c., with changes of temperature.

Claim.—First, the combination of the horizontal wires *C C* with strips *B B'* looped around them, substantially as shown and described.

Second, the posts *A*, constructed of bar iron in U-form, with the flanges at bottom to adapt them to be bolted to a base, substantially as described.

Third, the springs *J J*, adapted and employed to operate substantially as and for the purpose set forth.

65,026.—HARRIS W. THORNBURG, Mottistown, Ind., assignor to C. W. MORRISON, same place.—*Cattle Pump.*—May 21, 1867.—The circular platform is rotated by the animal. An annular serpentine cam below the platform works between two friction rollers attached to the pivoted lever that actuates the pump handle.

Claim.—The circular platform *A*, in combination with shaft *R*, when said shaft is arranged by means of slot *t*, that the pumping apparatus will adapt itself to the weight of the animal, substantially as set forth.

Second, spring *F*, provided with friction rollers in combination with the tilting platform *A*, as and for the purpose described.

Third, the circular or tilting platform *A*, shaft *R*, slotted head block *B*, cam wheel *K*, and lever *m*, all arranged substantially as and for the purpose specified.

65,027.—WM. J. TURNER, Utica, N. Y.—*Boot and Gaiter Strap.*—May 21, 1867.—The strap by which the boot is drawn on is formed out of a part of the boot leg.

Claim.—The boot or gaiter strap, constructed and operating substantially as described.

65,028.—CHARLES WEED, Boston, Mass.—*Bed Bottom.*—May 21, 1867.—Two short slats are rooted in the rails and incline upward therefrom; the long slat is laid on their ends and confined thereto by an elastic ring, outside which a fulcrum is interposed between the slats.

Claim.—The spring support made of one long and two short slats, when these are combined through the medium of stationary fulcra, and springs adjustable relatively to said fulcra, as means for graduating the yielding resistance of the support, substantially as described.

65,029.—A. M. WHITE, New York, N. Y.—*Brush.*—May 21, 1867.—The ends of the staples which enclose the "knot" of bristles are clamped in the enlarged recesses at the terminations of the sockets in the back of the trough.

Claim.—The enlarged chambers *a'* of the holes *a*, in combination with the staple-like wires *b*, substantially as and for the purpose specified.

65,030.—WILLIAM N. WHITELEY, JR., Springfield, Ohio.—*Harvester Rake.*—May 21, 1867.—The drop platform is supported on one end of a lever whose other end carries a roller running on the cam disk, to which the rake is attached. A flange on the inner side of the cam disk comes nearly in contact with a fixed stop and prevents the rake from being thrown out of gear, except when raised from the platform, a recess in the flange receiving the stop in this position.

Claim.—First, driving the rake and reel directly by means of a worm screw on the cutter's crank shaft, and a worm gear on one end of the reel shaft, substantially as shown and described.

Second, the quadrant-shaped dropping platform *P*, hinged to the finger bar, substantially as and for the purpose set forth.

Third, the combination of the quadrant-shaped platform *P*, with the rake *G*, arranged to operate in conjunction with said platform, substantially as described.

Fourth, the combination of the rake *G*, the cam *F*, and quadrant-shaped dropping platform *P*, so arranged that the dropping of the platform is dependent upon the moving of the rake, substantially as described.

Fifth, in combination with the dropping platform *P*, and rake *G*, the stop *O*, substantially as and for the purpose set forth.

Sixth, the combination of the clutch lever *L*, and the stop lever *M*, substantially as and for the purpose set forth.

Seventh, the combination of the cam *F*, lever *S*, and

dropping platform P, substantially as and for the purpose set forth.

65,031.—MICHAEL WINSLER, WM. CAMPBELL, and LYMAN HARDMAN, Tuscarawas county, Ohio.—*Horse Hay Fork.*—May 21, 1867.—The inner tines of the pivoted forks correspond during insertion and are crossed by the action of the toggle bars; the latter are connected to the bow-heads of the tines and secured, when longitudinally extended, to clevises on the forks.

Claim.—The fork A and B, when constructed and operated in such a manner that the point of the outside tine of each fork will come in contact with the point of the inside tine of the other fork, substantially as and for the purpose herein set forth.

65,032.—PETER WINTER, Horicon, Wis.—*Manufacture of Brown Metallic Paint.*—May 21, 1867.—Peroxide of iron, 84.46; sesqui-oxide of manganese, 4.55; silica, 8.34, and alumina, 2.65. The ingredients are burnt, pulverized, and mixed with oil.

Claim.—The brown metallic paint, manufactured from the substance popularly known as dead or shot iron ore, consisting mainly of peroxide of iron and manganese, when treated substantially as herein shown and described.

65,033.—GAUIS B. WISEMAN, Sycamore, Ill.—*Valve for Stove-pipe Dampers.*—May 21, 1867.—The leaves of the valves fold upon each other by longitudinal movement of the stem. To open the entire area of the pipe the valve is turned upon its axis.

Claim.—First, a folding damper valve, composed of the leaves B C D, operated by a sliding stem A, the whole constructed substantially as set forth and described.

Second, the folding and revolving damper valve, constructed and operated substantially as set forth and described.

65,034.—CHARLES V. WOERD, Waltham, Mass.—*Watch.*—May 21, 1867.—The crown gear of the handle spindle engages a spur wheel co-pivoted with a lever whose long arm extends outside the case and whose shorter arm carries a pinion which, by the oscillation of the lever, engages either the cannon pinion to set the hands, or the gear of the main-spring barrel to wind the spring.

Claim.—First, in combination with the wheels c, and means for rotating the same, the lever b, provided with wheel d, when arranged to operate substantially as described.

Second, in combination with the lever b and wheel d, a spring catch, latch pin, and stops, substantially as and for the purpose described.

65,035.—SOLOMON W. YOUNG, Providence, R. I., assignor to himself, J. W. HOARD, and R. A. DENISON, same place.—*Machine for making Eyelets.*—May 21, 1867.—The strips of eyelet stock are forwarded by a reciprocating pawl engaging the recess beneath the simultaneously descending punches, to perforate and form the eyelet.

Claim.—First, the combination as well as the arrangement of the feeding mechanism, the dies i l, the punches m n, and mechanism for operating such punches substantially as described.

Second, the die plate as made with the guide groove h, and the gauge cavity k, arranged with the dies i l, substantially as described.

65,036.—SOLOMON W. YOUNG, Providence, R. I., assignor to himself, J. W. HOARD, and R. A. DENISON, same place.—*Machine for making Eyelets.*—May 21, 1867.—The strip of eyelet metal is forwarded by the grasping jaws of a reciprocating lever, between the dies which form frusto-conical recesses, preliminary to annealing and punching.

Claim.—First, the die plate as constructed with the groove or channel b and the depression e, as and for the purposes set forth.

Second, the combination of the retainer H with the die and the punch, or the same and the guide channel, such retainer to operate with the punch, substantially as specified.

Third, feeding apparatus made substantially as described.

Fourth, the combination as well as the arrange-

ment of such feeding apparatus or its equivalent with the punch and die and the retainer, as specified.

Fifth, the combination of the feeding apparatus, the punch and die, the retainer and the guide channel, to operate as specified.

Sixth, the combination as well as the arrangement of either or both the guide staples, with the die plate, the punch, and the feeding mechanism, as explained.

Seventh, the combination of the roller f, the guide channel, the retainer, the punch, and die, and more staples, and the feeding mechanism.

65,037.—WILLIAM G. ADAMS, Franklin, Mass.—*Machine for Hulling Rice.*—May 28, 1867.—The rough rice passes between an elastic roller and a concave surface near thereto, and then between the said roller and the elastic belt. It is detached from the roller by a clearer and brought by the belt against the roughened steel roller.

Claim.—The combination of a narrow-outletted hopper, an elastic yielding feed roll, with its corresponding concave, and elastic yielding conveying surface, a rough surfaced cylinder, and a surface opposed to the yielding conveying surface, and extending between the feed roll and the rough surfaced roll nearly tangential thereunto when said parts or their equivalents are arranged so as to operate substantially as described.

65,038.—WILLIAM ADAMSON, Philadelphia, Pa.—*Apparatus for Securing Pulverized and other Materials to Paper.*—May 28, 1867.—Two travelling endless aprons gradually converge to the pressure rollers and carry the paper on which the pulverized material is spread. The action of the rollers spreads the material evenly.

Claim.—The two endless aprons E and F, in combination with rollers so arranged that the said aprons will converge towards pressure rollers D and D', as and for the purpose described.

65,039.—J. H. ALDRICH, Nashua, N. H.—*Wagon Body.*—May 28, 1867.—The floor extends around the wheels at the same level, caps covering in the portions of the wheels extending above the floor.

Claim.—The arrangement and combination of said sill A with cap B, for the purpose herein described.

65,040.—PETER ANDREW, Cincinnati, Ohio.—*Tank for Storage of Petroleum.*—May 28, 1867.—The wooden tanks are above brick tanks buried in the earth; the upper tanks have surrounding embankments enclosing water spaces and are connected with those below by tubes to pass the oil rapidly into the latter in case of fire; water may be passed to the cisterns if necessary.

Claim.—First, the oil tank, so constructed that the oil will rest on the surface of the water and be surrounded by water on its sides, as set forth, when said tank is arranged and combined for discharging into the lower reservoir in case of fire, substantially as set forth.

Second, for the purpose of extinguishing fire and saving oil that may be on fire, oil tanks situated in relation to each other, as described, connected by pipes, constructed and arranged in such a manner that the oil from the upper tanks may be conveyed to the lower ones without danger of fire being communicated through these pipes from the upper to the lower tanks, should the oil be on fire at the time of its being transferred.

Third, the construction and arrangement of oil tanks and pipes connecting these tanks, as described and specified, for purposes set forth.

65,041.—CHARLES A. BABCOCK, Frankfort, N. Y., assignor to himself, D. M. GOLDEN, and D. M. KENYON, same place.—*Match Safe.*—May 28, 1867.—One match at a time falls into the tray and is drawn out by the motion of the slide. The match is elevated by a spring finger, brought in contact with the friction surface, and held till removed or burned up.

Claim.—The match-delivering drawer d, in combination with the spring igniter h and finger i, for elevating the lighted end of the match, substantially as set forth.

Also, forming a receptacle l for the burned matches upon the removable cover k to the hopper a, so that

said burned pieces may be removed with facility from the match safe, as set forth.

65,042.—G. H. BABCOCK and S. WILCOX, JR., Providence, R. I.—*Steam Generator.*—May 28, 1867.—The several sections are arranged side by side and connected together so as to form an intermediate combustion chamber between them. The inclined pipes have internal circulating pipes, and the horizontal pipes have short vertical steam pipes for the escape of the steam generated therein.

Claim.—First, a steam generator made up of sections of pipes, each of the several sections being composed of a series of inclined pipes B, and a series of horizontal pipes C, united at the ends by distinct side pipes appropriate to each section, the several sections, when arranged side by side and connected, forming an intermediate combustion chamber A, and operating to cause a constant circulation of the water through the pipes in one direction, substantially as described.

Second, in combination with the series of horizontal pipes C, the series of upright connecting pipes D, for the purpose of allowing the steam, as formed, to separate from the water and rise to the discharge aperture, arranged substantially as described.

65,043.—THOMAS W. BALL, Morrisania, N. Y.—*Tempering Umbrella Ribs.*—May 28, 1867.—After hardening, the ribs are placed in longitudinal tubes in a cylindrical frame, which is heated by two lines of gas jets and rotated to equalize the heat and the resulting temper of the ribs.

Claim.—First, a tubular opening into which the ribs are introduced, in combination with gas jets, or other source of heat, so applied as to act upon all sides of such tubes or tubular openings, and temper the umbrella ribs with uniformity, as specified.

Second, a double casing of non-conducting material, in combination with such tubular openings, and heat applied, in the manner and for the purposes specified.

65,044.—AUGUSTUS BARNES, Southington, Conn.—*Treating Affections of the Skin.*—May 28, 1867.—Warts, "birth marks," &c., are removed by the use of a double convex lens, by which the solar rays are concentrated upon the spot and act as a caustic to extirpate the wart or discoloration.

Claim.—The use or employment of a glass lens for removing flesh marks and discolorations, substantially in the manner described.

65,045.—WALLACE BARNES, Bristol, Conn.—*Tempering Springs.*—May 28, 1867.—The spring is placed between metallic plates whose surfaces are corrugated or perforated to permit the tempering fluid to flow between the coils.

Claim.—The employment of one or more coils, as shown and described, in the process of tempering springs.

65,046.—HARRY S. BARTHOLOMEW, assignor to himself and G. W. BARTHOLOMEW, same place.—*Brace for Boring Bits.*—May 28, 1867.—The jaws slip into slots in the socket, projections in the latter entering depressions in the sides of the former to prevent their withdrawal when covered by the screw sleeve.

Claim.—The protuberance *a* upon the socket A, with a corresponding depression *a'* in the jaws, substantially as and for the purpose described.

65,047.—HENRY W. BARTOL, Philadelphia, Pa.—*Steam Trap.*—May 28, 1867.—Explained by the claims and illustrations.

Claim.—First, the arrangement of spring A, in cylinder A B A' B', so that when the steam enters the cylinder the expansion of metallic spring A will close opening E, as and for the purpose described and set forth.

Second, the spring A, held and secured in proper place by means of ring bosses K and bevel notch R, as and for the purpose described and set forth.

65,048.—W. L. BRARDSLEY, Binghamton, N. Y.—*Lathing Apparatus.*—May 28, 1867.—Several laths are placed in the intervals between the blocks on the board, and are held in position while being nailed.

Claim.—The construction and use of the apparatus herein described and set forth.

65,049.—HENRY BENTER, Pittsburgh, Pa.—*Washing Powder.*—May 28, 1867.—Composed of carbonate of soda, 18 pounds; ultra-marine or indigo, $\frac{1}{2}$ ounce, and cuttle-fish bone, $\frac{1}{4}$ ounce.

Claim.—A washing powder or compound composed of sal soda or its chemical equivalent, cuttle-fish bone, and ultra-marine, or other equivalent coloring matter, mixed in about the proportions above stated, and substantially in the manner and for the purposes hereinbefore set forth.

65,050.—R. W. BIGGS, Jacksonville, Fla.—*Plow.*—May 28, 1867.—The standard is pivoted to the beam and adjustably secured by bolt to the curved bar beneath the beam.

Claim.—The combination and arrangement of the slotted stock C, point or share E, and semi-circular stationary adjusting plate D, with each other and with a suitable plow beam A, substantially in the manner and for the purpose herein set forth.

65,051.—P. BLOOMSBURG, JR., and J. MOLYNEUX, Bordentown, N. J., assignors to BORDENTOWN MACHINE COMPANY.—*Mechanical Movement.*—May 28, 1867.—The eccentric is connected to a crank, and another crank at right angles to the former is connected to a bell crank, oscillating on a fixed pin, and connecting to a projection on the eccentric rod. This device is intended to give equal motion to the crank shaft.

Claim.—The single eccentric B on the driving shaft, the eccentric rod C, lever D, and rod F, in combination with the double crank on the driving shaft, the whole being arranged and operating substantially as and for the purpose set forth.

65,052.—EZEKIEL BOOTH and JOB A. DAVIS, Watertown, N. Y.—*Sewing Machine Shuttle.*—May 28, 1867.—A longitudinal spring at the bottom of the bobbin recess has a journal socket attached; the spring allows the moving of this socket piece to admit the bobbin.

Claim.—The longitudinal spring *s*, with the socket B attached, for the purpose of securing the bobbin, constructed and operating substantially as set forth.

65,053.—JAMES H. BREWER, Atlas, Mich.—*Garden Hoe.*—May 28, 1867.—The shanks of the scuffle hoe are attached to the upturned ends of the blade, each portion of which is sharpened.

Claim.—Turning up the ends of the blade, and forming upright cutters at right angles to the main blade, in combination with attaching the shanks to the outer and upper portion of the turned-up end of the blade to clear weeds and earth.

65,054.—JOHN BURT, Detroit, Mich.—*Canal Lock.*—May 28, 1867.—The water is introduced in a diffused state through perforated tubes or diaphragms. The vertically sliding gate is made of elastic material and in such a manner that the pressure of the water forces the edges more closely into the grooves in which they slide.

Claim.—First, discharging the water into and from the lock chamber of a canal in a diffused or divided state by means of a diaphragm or apertures formed in the bottom of the said chamber, substantially as shown and described.

Second, the herein-described mechanism discharging the water into and from the canal lock, the same consisting of tubes or conduits communicating with the higher and lower levels of the canal, and extending along the bottom of the lock chamber, and perforated so as to allow the water to enter or be drawn off from the said chamber at several points simultaneously and in a diffused state, substantially as shown and set forth.

Third, the combination with the said tubes or conduits of the valves for regulating the flow of water, the said valves, at each end of the tubes, coupled or united together so as to be operated simultaneously, substantially as shown and set forth.

Fourth, the combination with a tubular valve seat, in which apertures are formed diametrically opposite each other, of a tubular valve provided with corresponding apertures, the said valve and valve seat being arranged for operation relatively to the water tube or conduit, substantially as shown and specified.

Fifth, the water gate herein described, the same be-

ing made of steel or other suitable elastic material, and having a curved shape, as specified, so that when under pressure the sides of the said gate shall be held firmly and tightly against the quoins or guides in which it slides, substantially as shown and set forth.

Sixth, the combination with the elastic water gate, sliding vertically in quoins or guides of the compensating weight for equilibrating said the gate, substantially as shown and described.

65,055.—WILLIAM H. BUTLER, New York, N. Y.—*Fire-proof Safe.*—May 28, 1867.—The heterogeneous character of the associated materials baffles a drill.

Claim.—First, the tresselated work or interspersed masses of steel united with a softer metal B, by being rolled or forged together and afterwards hardened by sudden cooling so as to form a conglomerate metal of unequal hardness, the masses being arranged substantially as and for the purpose herein specified.

Second, in burglar-proof structures composed of more than one layer of plates, employing plates composed of soft iron joined with plates containing hardened steel by means of rivets C, or their equivalents, arranged relatively to each other and to the several plates, substantially in the manner and for the purpose herein set forth.

65,056.—CALEB CADWELL, Waukegan, Ill.—*Steam Engine.*—May 28, 1867.—A hollow revolving cylinder which is placed in the upper part of the fire-box, receives a supply of water at one end and discharges steam at the other. The pump cylinder turns in a metallic stock and has chambers in the inner end corresponding with the receiving pipes in the stock.

Claim.—First, the double-piston cylinder L, without heads, and having the valve 6 constructed and arranged with reference thereto, substantially as described.

Second, the pump valve 2, having the shaft Q attached, and operated as described and set forth.

65,057.—JOHN W. CARTER, New York, N. Y.—*Chalk-line Marker.*—May 28, 1867.—The twine drum is within a case containing powdered chalk, and twine passes through the side of the case.

Claim.—The use or employment of the spindle and cord when the same shall be constructed and combined, substantially as shown, for the purpose indicated.

65,058.—MARVIN CONVERSE, Jordan, N. Y.—*Curtain Fixtures.*—May 28, 1867.—The frame to which the roller is hung is vertically adjustable by cords to admit light over the blind.

Claim.—The sliding frame C, carrying the curtain roller and journals, moving freely upon the edge of the window frame on the guide rod B, in combination with the cords A, E' and D', for raising and lowering the curtain, substantially as described.

65,059.—F. E. COOK, Seville, Ohio.—*Harvester Rake.*—May 28, 1867.—The rake-head is secured to a sleeve which is traversed on a square guide-bar by a rod from the driving gears. The rake-head is raised by a cam at the end of its stroke and is held vertical during its non-effective stroke by means of the engagement of a latch-spring with a disk on the square guide-bar of the rake-head; it is disengaged at the grain end of the platform and thrown down on the latter by a spring, to commence its effective stroke.

Claim.—First, the pivoted curved bar B, sleeve L, and rake K, in combination with the rod M and cam E, as and for the purpose set forth.

Second, the notched wheel F, springs I and J in combination with the bar B and rake, as and for the purpose described.

Third, the nut and screw, with lug, in combination with the sleeve L and bar B, so as to allow the rake to fall back in place in the spaces a, before it is drawn across the platform in discharging the gavel, as and for the purpose specified.

65,060.—CHARLES T. CRANE, Lowell, Mass.—*Bench Hook or Dog.*—May 28, 1867; antedated May 19, 1867.—The rectangular frame has a thumb-screw by which it is clamped to the bench and a spring hook to receive the impact of boards laid on the bench to be planed.

Claim.—A bench hook consisting of a frame a, socket b, for the sliding spindle d, with hook e attached, and spring f, all as mechanically arranged for the purpose herein described, and the manner fully set forth.

65,061.—CHARLES CROLEY, Dayton, Ohio.—May 28, 1867.—*Red Bottom.*—The supporting bars at the head and foot slide upon each other for lateral adjustment of the frame.

Claim.—The construction of the supporting pieces a and b, with slotted ends, substantially as and for the purpose specified.

65,062.—JOB A. DAVIS, Watertown, N. Y.—*Shuttle for Sewing Machines.*—May 28, 1867.—Instead of passing the thread through several holes in the side of the shuttle it is passed between the latter and the lever pad, the pressure being regulated by the screw and the coiled spring beneath.

Claim.—The lever pad s, screw w, and coil spring c, when constructed and arranged, substantially as and for the purpose set forth.

65,063.—WILLIAM M. DAVIS, Cleveland, Ohio, assignor to himself and WILLIAM L. BECKWITH, same place.—*Compound for Refining Cider, Ale, &c.*—May 28, 1867.—For refining liquids. Codfish sounds, 16 oz.; calcined alum, 4 oz.; and salt, 8 oz.; add to 10 gallons partially fermented cider; let remain 10 days; rub through a ½-inch mesh sieve, stir and add one gallon to a 40-gallon barrel.

Claim.—The composition above described, composed of the ingredients above mentioned, or their known equivalents, substantially as and for the purpose set forth.

65,064.—DANIEL S. EARLY, Hummelstown, Pa.—*Rock Drill.*—May 28, 1867.—The drill rod may be inclined at any angle and slides in a central rectangular hole and an upper and lower circular guide hole. Its rectangular portion is raised from the hole at each reciprocation and receives partial rotation.

Claim.—The drill rod, constructed with the fixed collar K, and shoulder L, in combination with the tappets G, and slotted cross-head H, substantially as described for the purpose specified.

Second, the tappets G, with shoulders g, and turned ends h, arranged with the slotted cross-head H in combination with the drill-rod I, having fixed collar K, and square shoulder L, substantially as described for the purposes specified.

65,065.—LEWIS C. ENGLAND, Philadelphia, Pa.—*Apparatus for Evaporating Liquids.*—May 28, 1867.—The wooden box has a false bottom of copper, and in the chamber beneath there are longitudinal partitions forcing the steam entering at one corner to follow a tortuous course in its passage to the place of exit. This metallic bottom is concave on the upper side, and a rock shaft has downward projections, whose ends nearly touch this portion in their oscillation. The box can be inclined endwise, being pivoted to an inclined support.

Claim.—First, a stirrer composed of main shaft L L', teeth D D', upright U S, combined with evaporator B P by means of journals O, capable of a rocking motion, constructed substantially as described.

Second, the combination of frame o o, tapering frame o' o', and crank screw S S C, working together, in the manner and for the purpose described.

Third, box B P, false metallic bottoms d e d e, frames o o o' o', crank screw S S C and stirrer L L', all combined and working together in the manner above described and for the purpose set forth.

65,066.—THEODORE S. FOSTER, Fitchburg, Mass., assignor to himself and JOHN P. SABIN, same place.—*Pipe Cutter.*—May 28, 1867.—The pipe rests against anti-friction rollers in the curved end, and is cut by a pivoted blade, driven forward by a screw of the handle-shank, which is socketed in the other piece.

Claim.—First, the knife b, constructed as described and attached to the claw, substantially in the manner and for the purpose above specified.

Second, the combination of the knife b, with the friction rollers or their equivalent, and the feeding screw as above described.

65,067.—CHARLES H. FOWLER, West Roxbury, Mass.—*Curtain Fixture.*—May 28, 1867.—The cord end of the roller has a bearing on a spring box by which it is raised to a friction bearing above, except when the cord is drawn to turn the roller.

Claim.—First, the combination with a curtain roller of a sliding or spring box or clamp, under such an arrangement that the said box or clamp shall not only constitute the means by which the roller and curtain are held in position, but also support the journal of the said roller at all times and form the bearing in which it revolves as herein set forth.

Second, the combination of the journal of a curtain roller with the recessed bracket and sliding or spring bearing, substantially in the manner and for the purposes herein specified.

65,068.—KASSON FRAZER, Syracuse, N. Y.—*Shaft Tug.*—May 28, 1867.—The shaft-loop is of leather, bound by an iron strap, the latter giving support to the buckle of the saddle tug.

Claim.—As a new article of manufacture a shaft tug composed of the parts A, B, C, substantially as and for the purposes described.

65,069.—E. R. GARD, Chicago, Ill.—*Brick Press.*—May 28, 1867.—As the mold wheel rotates, the rollers run upon a cam track which operates the plungers, to press and eject the brick. At ejection the bricks are turned on edge by the vertical action of a pin beneath the follower lid. The molds have pivoted lids worked by a cam lever, and have rollers through which the upper pressure is communicated to the bricks. An adjustable plate on the plunger determines the thickness of the bricks.

Claim.—First, a follower S, provided with one or more rollers *u u*, running under and in combination with flanges *f f*, projecting from the track nearly along its entire length, substantially as and for the purposes herein specified.

Second, the removable journals V V, for the supporting roller U of each follower, the said bearings being provided with oil cavities for containing oil and some porous, or capillary substance, to keep the journals constantly lubricated, substantially as herein set forth.

Third, an adjustable top or lid X for the followers, by means of the washers *x x*, or any equivalent thereof, for the purposes herein described.

Fourth, the combination of the projecting rim b of the mold wheel, and the supporting roller L, for the purpose set forth.

Fifth, the self-lubricating journal box of the roller L, constructed substantially as herein specified.

Sixth, the adjustable pressure portion G of the track, when combined with india-rubber, or equivalent, springs H H, substantially as and for the purpose specified.

65,070.—JOSEPH H. GREENLEAF, New Haven, Conn.—*Forming the Edge of Water Proof Soles.*—May 28, 1867.—Improvement on the patent of John W. Coburn, June 27, 1865. The leather is cut in a semi-circular ended strap, double the length required for the finished strip. It is then punched centrally to the end curves, then cut from one perforation to the other; dampened, stretched, and shaped on a former.

Claim.—The leather edge for soles constructed and formed substantially as herein set forth, as a new article of manufacture.

65,071.—JOSEPH H. GREENLEAF, New Haven, Conn.—*Apparatus for forming the Edge of Water Proof Soles.*—May 28, 1867.—Improvement on patent of J. W. Coburn, June 27, 1865. The base disk gives support to a vertical former. The leather is cut in a long strip, and, after softening, is coiled on the former and then pressed down with a follower and left to harden. The layers are then divided obliquely and the edges riveted.

Claim.—The apparatus substantially as herein described for forming the edge of soles.

65,072.—JOSEPH H. GREENLEAF, New Haven, Conn., assignor to himself and O. P. CASE, same place.—*Chair and Bedstead.*—May 28, 1867.—The frame of the chair is extended in the manner of a "lazy tongue" to form the bed, its seat being swung

out to form the foot board. For transportation the back is folded down to the frame.

Claim.—The combined chair and bedstead herein described, having the seat H and back G attached thereto, and so as to be folded, the seat H down toward the back, and the back G backward down on the frame, substantially as herein set forth.

65,073.—BENJAMIN F. GRIMES, Dawsonville, Md.—*Corn Planter and Fertilizer Combined.*—May 28, 1867.—Two rows are planted simultaneously and fertilizing substances dropped with the corn. The fertilizer slide has a leather flap-valve, whose edge is drawn down by a hanging weight when discharging, to keep obstructions from beneath the slide.

Claim.—First, The arrangement of the corn hoppers C C, fertilizer hoppers D D, discharge tubes E E, and inclined tubes F F, substantially as and for the purpose herein set forth.

Second, the combination of the bar G, hinged arms H H, levers I I, slides J J, and dropping slides N N N', substantially as herein described.

Third, the combination of the bar P, levers P' P', rods Q' Q', bar P'', and valves Q Q' Q'', all arranged and operating substantially as herein described.

Fourth, the combination with the bar G, and its described connections with the dropping mechanism of the lever R, arranged and employed in the manner and for the purpose explained.

Fifth, the combination of the rock shaft T, arms T' T'', tappet or projections b, notch post U, and and spring catch V, arranged and operating in connection with the dropping mechanism, as and for the purpose specified.

Sixth, the stirring shafts O O', in combination with the levers I I, links o o, and lugs o' o', as described.

Seventh, the discharge tube E, when made in two or more parts, and hinged in order to adapt the lower section to be turned up and held in its raised position, substantially as described.

Eighth, the arrangement within the discharge tubes of the deflecting pieces or plates a, substantially as and for the purpose set forth.

Ninth, the weights G' G' in combination with the bar G, as and for the purpose explained.

Tenth, the frames h h, carrying the shovels h', and covers h'' h'', in combination with the supporting bar A, slotted pendants A' A', and adjusting pins a', all arranged and operating in the manner and for the purpose explained.

Eleventh, the combination with the dropping slide of the fertilizer hopper D, of the flap valve d, and ball or weight e, applied and operating in the manner and for the purpose specified.

65,074.—J. A. HALL, Greenfield, Ind.—*Grain Cleaner.*—May 28, 1867.—The octagonal screen revolves on a horizontal axis. A circular series of cams on the screen-head give a salutory motion to the hopper and sieves above, through which the grain first passes. The eduction opening is adjusted by a slide.

Claim.—First, the shaking shoe C, hinged to the frame and agitated by contact with the circular series of cams or projections on the head of the rotating screw, substantially as described.

Second, the rotating screw G, in combination with the shaking shoe C, and the shutter P, for regulating the discharge, substantially as described.

65,075.—ALBERT HALLOWELL, Lowell, Mass., assignor to himself and HORACE E. BARKER, same place.—*Steam Cook.*—May 28, 1867.—Improvement on the patent of Hallowell & Barker, November 28, 1865. The lever valve stem has an axial socket in its upper, screw-threaded end to receive the lower end of the square operating stem, which slides vertically therein and by which it is rotated. This stem passes through a conical upper valve, which is kept to its seat by a spiral spring.

Claim.—The combination as well as the arrangement of the spring s, or the same and either or both the chambers n P with the auxiliary conical valve e and seat f, the cap F, the hand wheel I, and the key E, employed for effecting, by aid of the screw c d, the vertical movements of the main valve A, with respect to its seat B, as described.

65,076.—W. M. H. HANSON, Albion, N. Y.—*Washing Machine.*—May 28, 1867.—The roller forms part of a ribbed surface, over which the clothes are drawn as they pass beneath the rotating brush. The upper portion of this surface is hinged and has pressure springs tending to keep it in proximity to an upper free roller, under which the clothes pass.

Claim.—First, the rotary brush E, one or more rollers I, and the screw K, in combination with the corrugated board H, operating in the manner and for the purpose shown and described.

Second, in combination with the above the roller L and the box A, having two compartments C and D, substantially as shown and described.

65,077.—C. F. HARLOW, Boston, Mass., and E. H. PERRY, Roxbury, Mass.—*Machine for Cutting Hair, Grass, &c.*—May 28, 1867.—The moving lever carries a segmental rack engaging a spur wheel whose shaft carries a disk; the under side of the latter is cam-grooved to receive a pin in the cutter plate and cause its reciprocation several times to one movement of the lever.

Claim.—First, so combining, arranging, and operating the two sectoral plates A B, as to be enabled when desirable to operate them by one hand, essentially as described.

Second, combining the two plates A B and their operative mechanism, in such manner as to obtain a number of reciprocating movements of the said cutter plate B over the plate A, to one movement of the handles *h h'* or the lever F, substantially in the manner as set forth and explained.

Third, the mechanical construction of the machine substantially as above described, that is, the combination of the two plates A B, bar D, lever F, provided with the handles *h h'* rack and pinion *e* and *d* and cam-groove *k*, in the manner and to operate as specified.

Fourth, the peculiar device for operating the cutter plate B, consisting of the rack *e* applied to the lever F, the pinion *d*, and the disk *b'* with its cam groove *k*, operating in connection with a stud upon the cutter plate, substantially in manner and to operate as described.

Fifth, the employment of the friction roller *i*, for the purpose of keeping the two plates A B in contact, and relieving the friction between the latter and the bar D, substantially as set forth.

65,078.—WALTER HART, Philadelphia, Pa.—*Indicating Apparatus for Oil and other Stills.*—May 28, 1867.—A pressure gauge, a thermometer, and a transparent water gauge containing a hydrometer, are associated together in the same apparatus for attachment to a still.

Claim.—An apparatus, substantially such as described, which, when applied to a still or other evaporating vessel, will show externally the quantity, specific gravity, temperature, pressure, color, and rate of evaporation of the contents of the still, by means of passages and indicators, substantially as described.

65,079.—ANDREW HARTMAN, Canton, Ohio.—*Car Coupling.*—May 28, 1867.—The link is engaged by a swinging pin whose lower flattened end forms a part of the funnel-shaped opening of the draw-head, and is held in this position by a spring block, which is forced back by the entering link, releasing the said pin.

Claim.—First, the peculiarly-shaped apron or balance D of the pin E Z C, so arranged and constructed as to act both as a balance and a part of the mouth of the coupling, substantially in the manner and for the purpose herein specified.

Second, the peculiar combination and arrangement of the parts A and B, rotating pins E Z D, bolt H, block J, spring L, iron K, pins O O, slots S S, catch C, with handle I, the several parts being arranged as hereinbefore shown, and the whole forming a self-acting coupling, operating substantially in the manner specified.

65,080.—GEORGE R. HAY, Edgerton, Ohio, assignor to himself and J. R. SEELY, same place.—*Machine for Jointing Staves.*—May 28, 1867.—The stave blank is clamped to the sliding frame in its bent form and forwarded between the two jointing saws, which are adjusted to cut the edge to the proper inclination.

Claim.—First, the link *e*, rod *d*, spring *e*, pin *N'*, and clamps O O', in combination with the vibrating frame, substantially as and for the purpose set forth.

Second, the adjustable vibrating frame, provided with the devices for curving and holding the stave, and detaching said stave when finished, constructed and operating substantially as described.

65,081.—JOHN S. HOAR, West Acton, Mass., assignor to himself, C. HASTINGS, and N. C. CUTTER, same place.—*Vise.*—May 28, 1867.—The vise head is on a disk having rotary adjustment on its bed piece, and attachment by screws and thumb nuts. An anvil is attached to the vise.

Claim.—First, the combination of the vise with a table or other support by means of the plates A and B, axial pin *e*, bolts *c*, and nuts *d'*, all constructed and arranged substantially as described.

Second, in combination with the jaws C D, the anvil G, attached to the jaw C, and arranged in relation thereto as described.

65,082.—W. L. HORNE, Batavia, Ill.—*Steam Water Elevator.*—May 28, 1867.—The buoyant inner cylinder consists of two concentric shells with annular air space between, and slides freely in the outer cylinder. The head of the cylinder slides on a tappet rod, which operates the steam valve. A partial vacuum is obtained by condensation of steam, the cylinder rises, the head actuates the valve and admits the steam to depress the cylinder and expel the water.

Claim.—A water elevator consisting of the exterior cylinders *a* and interior valve cylinder *b* and valve *c*, operated in the one direction by steam and in the other direction by water, combined and arranged as set forth.

65,083.—GEORGE W. HUNT, Winchendon, Mass., assignor to JOB S. GRAY and JOHN S. WATSON, same place.—*Door Stop.*—May 28, 1867.—A bracket is cast upon the attachment screw, and has an upper socket to receive the rubber cushion.

Claim.—A combined metallic and elastic door stop, constructed and operating substantially in the manner herein described, for the purposes set forth.

65,084.—E. HUNTER, Cleveland, Ohio.—*Compound for Silver Plating.*—May 28, 1867.—Silver, 4 ounces; cyanide of potassium, 3 ounces; oil of sassafras, $\frac{1}{2}$ drachm; Paris white, 10 pounds; ammonia, 4 ounces; benzine, 2 ounces; water sufficient to hold the silver in solution.

Claim.—The herein described compound for cleaning silver ware, and cleaning and replating plated ware, or ware made of copper or any of its alloys, or of any other metals or alloys.

65,085.—JOHN S. HUNTER, Hartford, Conn.—*Mosquito Bar.*—May 28, 1867.—The mosquito bar is stretched on pivoted bows, and is thrown back similar to a calash top.

Claim.—The arrangement of the bows B more or less in number, and combined with an adjustable socket C so as to be attached to the bedstead, and to operate substantially as set forth.

65,086.—S. W. HUNTINGTON, Augusta, Maine.—*Blind Fastening.*—May 28, 1867.—The stem of the drop catch plays in a socket made in two sections and let into the bottom of the shutter.

Claim.—The combination with the catch bar as described of the socket formed in two parts with a chamber for receiving the head of the catch bar, and for allowing slight vertical movements of the same, substantially as and for the purposes herein shown and set forth.

65,087.—JOSEPH and JAMES INGHAM, San José, Cal.—*Gang Plow.*—May 28, 1867.—The plows are attached to bars pivoted at their rear ends, and having segmental racks engaging cog wheels for vertical adjustment. The axle is divided near to the left hand wheel, the two parts being connected by counterpart rack plates and bolts, to allow the adjustment of this wheel to the depth of furrow.

Claim.—First, the movable pivoted bars C C', with the segments D D', wheels E E', and pinions F F', to raise and lower the plows, substantially as described.

Second, the two-part axle G with the vertical connecting necks K K', to make the plows cut to an equal depth, as described.

Third, the eyes L L', together with the bar M and screw n, for the purpose of regulating the draft, substantially as described.

65,088.—S. A. JEWETT, Cleveland, Ohio.—*Melodeons, &c.*—May 28, 1867.—Independent manuals operate the diagonal levers to produce remote octave or intermediate tones. These manuals are in front of the usual keys, and are intended to be operated by the little finger.

Claim.—The tappets or independent manuals K, rods J, levers G, and rods H, in combination with the keys A and reeds C, in the manner and for the purpose set forth.

65,089.—WM. JOHNSON, Lambertville, N. J.—*Turning Lathe.*—May 28, 1867.—A stationary and continuous metallic cover is inserted through an aperture in the side of the slide rest and placed over the feed screw to protect it from chips and dirt.

Claim.—First, the continuous cover M over the feed screw G, said cover passing through an aperture in the slide rest, and in other respects arranged as set forth.

Second, constructing the feed nuts to allow the cover to pass between them and the peculiar arrangement of eccentric movable arm and connecting bars, whereby the feed nuts are made to move equal distances in opening and closing the feed screw by rods attached to said nuts at points unequally distant from their center of motion. The whole combined and operating substantially as herein set forth and described.

65,090.—ROBERT JAMES KELLETT, San Francisco, Cal.—*Punch for Car Tickets, &c.*—May 28, 1867.—The punch has a clearing spring for the perforator, and a lock receptacle to catch the chips and indicate the number of tickets cancelled.

Claim.—A punch with an attachment E or its equivalent for holding the clippings or chips of tickets, in the manner substantially as and for the purpose specified.

65,091.—THEODORE E. KING, Painesville, Ohio.—*Elastic Button for Carriages.*—May 28, 1867.—The ring of rubber is compressed by the head of the screw, which expands it to such a size as to fit the loop of the carriage curtain.

Claim.—First, the adjusting screw C in combination with the rubber collar D', arranged in relation to the curtains, in the manner and for the purpose substantially as set forth.

Second, the rubber collar D' and adjusting screw, as arranged in combination with the button hole E and curtain, in the manner as described.

65,092.—H. FREDERICK KNODERER, Sr., and L. F. KNODERER, Columbus, Ohio.—*Compound for Preventing Incrustation in Steam Boilers.*—May 28, 1867.—Composed of alum, two parts, glue, one; mixed, pulverized, and introduced in the shape of powder.

Claim.—The application of a compound or preparation of two parts of common alum and one part of common glue, prepared and applied as above specified, to prevent and remove the accumulations and incrustations of steam boilers and the pipes and tubes belonging thereto, as hereinbefore specified and substantially set forth.

65,093.—F. W. KUHNER, Rochester, N. Y.—*Rudder.*—May 28, 1867.—Auxiliary rudders are pivoted in transverse openings cut through the dead wood, and are connected to the ordinary rudder chain.

Claim.—The combination with the main rudder B of the series of auxiliary rudders E E E, arranged in the keel one after another, and capable of being connected with and disconnected from the main rudder in action, as herein set forth.

65,094.—L. B. LATHROP, San José, Cal.—*Gang Plow.*—May 28, 1867.—The plows are attached by standards to a diagonal frame, which gives them the required receding sequence. The rotary cutters preceding the plows act as land sides. The frame is hinged to an oblique axle, and is vertically regulated

by a screw bolt from the through beam, which is slacked to the fore carriage.

Claim.—First, the rotary cutters d, attached to the wheels C, and forming flanges thereon, for the purpose of acting as land sides for the plows, substantially as set forth.

Second, the axle B, when arranged obliquely below the tongue A, and when adjustable by means of the screw bolt a and slotted arm b, substantially as and for the purpose herein shown and described.

Third, the devices for raising and lowering the plows, consisting of the screw K, rods i and h, and of the axle B, lugs f and g, bar F, and bolts e, respectively, as set forth.

Fourth, the double tongue A M, in combination with the wheel I, supporting the end of the main tongue, and with the hinges l m n and o p s, substantially as herein shown and described.

Fifth, the plow beams E, when bent so as to form offsets at the top of the mold-boards, substantially as and for the purpose herein shown and described.

65,095.—NEHEMIAH W. LEE, North Providence, R. I.—*Tobacco Cutter.*—May 28, 1867.—The guillotine knife-bar rests upon springs, which return it after it has been depressed by the toothed cam.

Claim.—The knife D, with its rack b, sliding vertically in the frame B, and operated against the resistance of springs E, or their equivalents, by the lever G, with its movable fulcrum and toothed sector F, substantially as described for the purpose set forth.

65,096.—BURDETT A. LEWIS, New Britain, Conn., assignor to himself and JEREMY W. BLISS, Hartford, Conn.—*Trace Fastening.*—May 28, 1867; antedated May 16, 1867.—The latch is pivoted to the button and forms an extension thereof while passing through the eye of the trace, after which it is rotated to keep the latter attached.

Claim.—The projection e upon the button c, in combination with the latch C and protuberances h, substantially as and for the purpose described.

65,097.—JOSEPH H. LEWIS, Duxbury, Mass.—*Vise.*—May 28, 1867.—The rotating tube which actuates the movable jaw is threaded internally and sleeved upon the stationary screw, whose head is at the back of the fixed jaw. The slide of the movable jaw slips in a chamber of the fixed jaw.

Claim.—First, the arrangement and combination of the movable jaw e and internal threaded rotating screw i with the stationary support and jaw a and fixed external threaded screw g, substantially as described.

Second, the arched slide d, in combination with the support a of the stationary jaw, substantially as and for the purposes set forth.

65,098.—JOHN MARQUIS and JOHN W. KIMMEL, Crestline, Ohio.—*Bolster for Railroad Cars.*—May 28, 1867.—The three parts of the bolster are coupled by cast socket pieces; the bolster is an inverted arch, whose ends are adjusted to correct sagging by means of the terminal clamps and connecting rods and nuts.

Claim.—First, the clamping pieces F F, constructed in the manner and for the purpose herein specified.

Second, the combination of the rods O O with nuts g g g thereon and the clamping pieces F F, in the manner and for the purpose specified.

Third, the arrangement and combination of the clamping pieces F F and rods O O, as claimed in second claim, with the pieces A B and C and connecting pieces D D, the whole forming an adjustable bolster in the manner and for the purpose herein specified.

65,099.—CARLO FEDERICI MARTORANA, Baltimore, Md.—*Centrifugal Pump.*—May 28, 1867.—The wings are rounded on the lower side, and their faces so curved as to cause by their rotation a centripetal and upward flow of water to the vertical discharge pipe, which is traversed by the shaft.

Claim.—First, the pump, consisting of the wheel W, constructed as described and arranged to operate as and for the purpose herein set forth.

Second, the arrangement of the pump wheel W and tube or case T with the valves d in the bottom of a floating platform or vessel, substantially as and for the purpose set forth.

65,100.—BENJAMIN A. MASON, New York, N. Y.—*Machine for Making Screws.*—May 28, 1867.—To shave and nick the head and taper the point. Several blanks can be operated on simultaneously, and then moved forward to the next operation. The blank is rigidly held while being operated upon, the work being discontinued while passing from one device to another.

Claim.—First, the series of intermittently revolving jaws, in combination with the revolving shaft s^3 , cutter 15 and cone t^1 , constructed, arranged, and acting substantially as specified.

Second, the hanging saw u , actuated in the manner and by the means substantially as described, in combination with the blank holders o' for the purposes and as set forth.

Third, the pointing tool, secured upon the end of the revolving spindle v' , in combination with the lever 23, cam 24 and blank holders o' , as and for the purposes set forth.

Fourth, the arrangement and combination of all the mechanism herein described for shaving, nicking, and pointing screw blanks as set forth.

65,101.—J. FRANKLIN MASON, Bentonport, Iowa.—*Bridle.*—May 28, 1867.—This bridle has no headstall, the bit being a rounded piece of leather, united at its looped terminations, with straps buckled around the under jaw. The rein rings in the loops at the ends of the bit secure the disk-shaped guards.

Claim.—The rounded strap, in combination with guards and rings, to be secured to the horse's under jaw, in the manner and for the purpose herein described.

65,102.—MATTHEW F. MAURY, New Orleans, La.—*Cotton Bale Tie.*—May 28, 1867.—The plate has lateral projections at both ends, forming attachments for the bight of the wire rope. The sides of the plate are folded in to form round corners for the contact of the wire.

Claim.—The plate A, when provided with the folding flanges a^1 and shoulders b^1 , as described, for the purpose set forth.

65,103.—REUBEN MCCHESEY, Utica, N. Y.—*Breach-loading Fire-arm.*—May 28, 1867.—The forward end of breech piece is supported in front of the breech of the barrel, upon a vibrating fulcrum, allowing the breech piece to rise to a position in front of a breech check, where it will be sustained by the latter against vertical movement in firing. The breech piece is moved to admit the cartridge at half-cock, and is restored into firing position by full cocking the gun. The cartridge shell is ejected simultaneously with the exposure of the cartridge chamber.

Claim.—First, sustaining the forward extension of the breech piece upon a vibrating fulcrum piece a , substantially as described.

Second, the combination of the breech piece D, fulcrum piece a , latch d , operating substantially in the manner set forth.

Third, constructing the fulcrum piece a , so as to receive through it the spring a' , which depresses the breech piece, when the latter is released from the latch d , substantially as described.

Fourth, the arrangement of the cartridge shell extractor l^1 , so as to be operated upon with the full force of the spring a' , through the agency of the intermediate slotted device n^1 and the breech piece D D, the said parts being thrown into action by the act of cocking the arm, substantially as described.

Fifth, constructing the hammer G, with a flange g' for entering a recess g^2 , formed in the breech piece, assisting in holding the latter firmly in place, substantially as described.

Sixth, constructing the latch d of the breech piece, so as to receive the forward end of the mainspring J through it, said latch d being pivoted upon the trigger pin e' , substantially as described.

Seventh, applying the pin i to the breech-holding latch, and operating said pin by the projecting g on the inside face of the hammer G, substantially in the manner shown and described.

65,104.—WILLIAM L. McDOWELL, Philadelphia, Pa.—*Hinging Lids of Teakettles.*—May 28, 1867.—The lid is cast in segments with lugs upon them for

the hinge pintle, and the rear segment is attached to the body of the kettle by screws.

Claim.—A wide-mouthed teakettle having a hinged lid attached, consisting of the two segments D E, coupled together and applied so as to operate substantially as described, and for the purposes specified.

65,105.—JAMES MELCHER, Minneapolis, Minn.—*Bag Holder.*—The flexible discharge end of the hopper is contracted to enter the mouth of the bag, and when the latter is attached the enclosed portion expands to hold the bag open.

Claim.—First, constructing the lower part of hopper I with a hinged side, and connecting said side to the opposite side of the hopper by means of a flexible material, in order that it may accommodate itself to the mouth of the bag, substantially as set forth.

Second, in combination with the hinged side and flexible material, spring M, for the purpose of retaining the mouth of the bag open to its greatest extent, substantially as described.

65,106.—LEWIS MILLER, Akron, Ohio.—*Harvester Rake.*—May 28, 1867.—The arm has a regular rotation, but the rake teeth are connected to a sliding plate whose anti-friction roller traverses a cam-groove to regulate the rake to the shape of the platform and requirements of the case.

Claim.—In combination with a revolving arm carrying a pivoted rake or fork upon its outer end, a slide and connecting rod that is operated by a cam and guide and attached to said rake or fork, so that while the arm moves in a true circle the rake or fork may assume different positions upon it, substantially as and for the purpose described.

65,107.—CHARLES E. MITCHELL, New Britain, Conn.—*Snap Hook.*—May 28, 1867.—The latch is held immovably closed till the snap is turned to such relative position with the loop strap as to bring the heel of the latch in apposition with a depression.

Claim.—A rigid pressure attachment E, or its equivalent, acting against the heel of the latch to firmly close it with the hook, substantially as and for the purpose described.

65,108.—J. NEELY and SIMEON ALLEN, Buckingham county, Va.—*Manufacture of Alcoholic Spirits.*—May 28, 1867.—The expressed juice is allowed to ferment and is then distilled.

Claim.—First, the manufacture of spirituous liquors and alcohol from the juice of maize or Indian corn, substantially as herein set forth.

Second, as a new article of manufacture, spirituous liquors or alcohol made from the expressed juice of corn stalks.

65,109.—D. P. NICKERSON, Cleveland, Ohio.—*Car Wheel.*—May 28, 1867.—The annular tread flange is attached to the outer shell, which has a thin inner flange concentric with the rim. Between the flanges is a rubber ring filling the space, and within the inner flange are two rubber rings separated by an annular plate parallel with the wheel. A plate attached to the tread ring encloses these points and the hub has a vertical movement to bring the weight upon the rubber springs and render other springs unnecessary.

Claim.—First, the shell A, elastic ring F, and disk I, provided with the shoulder or flange C, in combination with the elastic rings H.

Second, the clutches L E and disk in combination with the elastic rings and shell A, substantially as and for the purpose set forth.

Third, the annular shoulders D M', rings H, plate M, and shell A, arranged substantially as and for the purpose set forth.

65,110.—GEORGE NIMMO, Jersey City, N. J.—*Furnace for Heating and Welding.*—May 28, 1867.—The articles to be welded are heated by the direct action of the fire in one chamber, while other articles may be merely heated in the adjoining chamber. Each chamber is accessible at different points.

Claim.—The welding and heating furnace, formed with the heating chamber b , fire and welding chamber a , and openings d e and f , in the manner and for the purposes set forth.

65,111.—J. L. ORDNER, Cleveland, Ohio.—*Pipe Wrench.*—May 28, 1867.—The serrated hook is adjustable toward and from the toothed extremity of the stock by turning within the pivoted nut. When the wrench is turned in the effective direction the hook is supported by the stock, but otherwise when the motion is reversed.

Claim.—Hook F and pivoted nut E, as arranged, and operating within and in combination with the slotted shank B, as and for the purpose set forth.

65,112.—SOLOMON OTTENHEIMER, New York, N. Y.—*Sectional Take-up for Corset Looms.*—May 28, 1867.—By means of the sectional roller the fabric is drawn along irregularly as the gores are woven, so that the fabric shall present a straight line to the reeds. The springs applied between the stationary shaft and the toothed rings allow the latter to yield to any folds or creases and permit them to pass.

Claim.—The springs *o*, applied between the stationary shaft *e* and the toothed ring *h*, in combination with the wheels *d* of the sectional take-up roller of a loom for weaving corsets and other irregular fabrics, substantially as set forth.

65,113.—GEORGE N. PALMER, Greene, N. Y.—*Horse Rake and Hay Spreader.*—May 28, 1867.—Improvement on his patent of December 12, 1865. The axle and clearer with the operating mechanism are above the tilting frame, which is balanced by springs at the fore end. The tending mechanism is operated by a ratchet and pawls connecting the turning axle therewith. The pawls are restrained from engagement by set screws, when raking.

Claim.—First, the arrangement and combination of the balanced frame B B, short levers F F, and the rake head E, in the manner herein described, for the purposes set forth.

Second, regulating and adjusting the tilting motion of the frame B by the screw hooks *k k* and springs *m m*, as described.

Third, the combination of the pawls *e e*, ratchets *b b*, and thumb screws *c c*, constructed and arranged substantially as and for the purpose specified.

65,114.—B. F. PERKINS, North Adams, Mass.—*Vise.*—May 28, 1867.—The lever socket of the vise screw has a spring which bears against the side of the lever.

Claim.—The spring B or its equivalent, in combination with the screw D and lever C, as herein described, and for the purpose specified.

65,115.—W. R. POMEROY, Millersburg, Ohio.—*Counter and Desk Seat.*—May 28, 1867.—The seat is centrally hinged to a bracket pivoted to the desk, so that it can be swung to or from the same. The seat is horizontally secured to the bracket by sliding back upon it.

Claim.—The bracket B, seat C, lugs D, and springs I, as arranged in combination with the counter A, for the purpose and in the manner as set forth.

65,116.—GEORGE RAMSAY, Clyde, Ohio, *Balance Wheel of Watches.*—May 28, 1867.—The curved elastic arms of the balance wheel enable the heavy rim to yield, upon concussion of the watch, without breaking the pivots. The rim travels between guide fingers which receive its impact, when thrown out of true by the concussion of the watch.

Claim.—First, a watch balance wheel constructed with spring arms, as and for the purpose set forth.

Second, the balance wheel with spring arms in combination with the guards, substantially as and for the purpose set forth.

65,117.—L. RASTETTER and A. SIMCOX, Fort Wayne, Ind.—*Shank Laster.*—May 28, 1867; antedated May 16, 1867.—The edge of the leather is clamped between the jaws by screwing down the handle. The pivoted fulcrum is then adjusted and the handle vibrated until the fulcrum piece touches the jaw.

Claim.—The shank A, handle B, stationary jaw C, movable jaw E, spring J, adjustable fulcrum D, combined and operated as described, and constructed in the manner and for the purpose specified and set forth.

65,118.—MARTIN C. REMINGTON, Auburn, N. Y.—*Fastening Seats to Carriages.*—May 28, 1867.—A hook connected to an eccentric on the seat engages over a pin in the body and is raised by the eccentric.

Claim.—First, the device for fastening seats to carriages and constructed substantially as described. Second, the eccentric C, and sliding hook E, substantially as described for the purpose specified.

Third, the locking device consisting of the spring toothed lever D, toothed ring F of the hook E, in combination with the eccentric C, substantially as described.

65,119.—UEL REYNOLDS, New York, N. Y.—*Shifting Rail for Carriage Tops.*—May 28, 1867.—The shifting bar is of wood, bent to form, and connected to the seat by bolts and nuts. This bar receives the slats and props of the top.

Claim.—The wooden shifting rail to which the metal slat irons and prop blocks are attached as set forth.

65,120.—E. P. RICHARDSON, Lawrence, Mass.—*Boot and Shoe.*—May 28, 1867; antedated May 16, 1867.—The barbed nail secures the layers of leather together, similarly to a peg. The nail may be made by barbing a wire and then dividing it into lengths.

Claim.—The system or mode of fastening the soles of boots and shoes, by means of barbed or corrugated nails or pegs, either with or without heads and driven either from the outside or inside of the boot or shoe, substantially as herein set forth, and for the purpose specified.

65,121.—E. A. L. ROBERTS, Titusville, Pa.—*Sand Pump.*—May 28, 1867.—The foot valve is raised by a vertical bolt whose head impinges against the sand. A series of side holes at the tube top allow exit to the air as the bucket rises.

Claim.—First, the combination, substantially as and for the purposes herein set forth and described, of a tube piston and foot valve, the latter being opened for the purpose of discharging the contents of the pump by means of the stem *k*, or its equivalent, whether attached to, or separate from, the valves.

Second, the perforations *s*, as arranged in relation to said pump for the purposes herein set forth.

65,122.—S. C. SALISBURY, New York, N. Y.—*Reducing and Refining Metallic Ores and Oxides.*—May 28, 1867.—An ordinary blast furnace is connected by a divided tyerc with three retorts which are placed over a furnace. Air is passed through one retort and steam through another. Hydrocarbon vapor, generated in a still, is passed through the third retort, where it is decomposed, forming a fixed gas. The hot air, superheated steam and gas, pass through the passages of the tyerc into the furnace.

Claim.—First, the application and use in blast and other like furnaces for reducing metallic oxides, of a blast of hydrogen and oxygen gases, or their equivalent, when heated to a temperature of from 700° to 800° Fahrenheit, or thereabouts, for the purposes set forth.

Second, the use in such furnaces in combination with such blast of hydrogen and oxygen gases, or their equivalent, heated as described, of carbon gas, when free from or obtained from hydrocarbons free from sulphur, phosphorus, ammonia, &c., for the purposes set forth.

Third, the use in such furnaces of such blast of hydrogen and oxygen gases, or their equivalent, so heated as described, and of such carbon gas free from sulphur, phosphorus, ammonia, &c., in combination with the ordinary air blast, for the purposes set forth.

Fourth, in combination with blast and other furnaces used for reducing ores, the use of a compound or divided tyerc constructed substantially as described, for supplying to such furnaces such blasts of different character, substantially as and for the purposes set forth.

Fifth, the use in blast and other furnaces used for reducing ores, of manganese, substantially as and for the purposes set forth.

65,123.—HENRY SANDERSON, Sheffield, England, assignor to WM. SANDERSON, New York, N. Y.—*Cutlery.*—May 28, 1867.—The steel blade has a short

tang which is secured, by pressure, in a cavity of the bolster the shank of which passes through the handle.

Claim.—The uniting the handle and blade in the manner substantially as herein described.

65,124.—D. SAUNDERS, Brooklyn, N. Y.—*Pipe Vise.*—May 28, 1867.—The jaw-piece is attached by a horizontal axis to the bench-piece, so as to rotate in a vertical plane, to allow the pipe to enter in any position at the lateral opening, to be gripped between the stationary and movable jaws.

Claim.—The improved pipe vise herein described turning on the axis C, and having the side opening H, to allow the introduction and removal of the work, the several parts being combined and arranged substantially as and for the purpose herein set forth.

65,125.—W. D. SCHOOLEY, Richmond, Ind.—*Straw Cutter.*—May 28, 1867.—The main shaft is placed beneath the box and operates the knife-gate by a wrist-pin. A cam on the shaft also operates the lever which actuates the ratchet feed-wheels by means of connecting rods.

Claim.—First, the arrangement of the balance wheel B, and main shaft C, relative to the main frame and knife sash E, substantially as described and for the purposes set forth.

Second, the use of the lever k, when provided with the adjustable head l, and operated by the cam D, and to operate in combination with the rods m n and the levers j j, for the purposes specified.

Third, the adjustable bearings O, as described and set forth.

Fourth, the keys u u, for adjusting the knife frame, as shown and described.

Fifth, the guard w, when made detachable, substantially as described and set forth.

65,126.—H. K. SEARS and S. L. HOLT, Hartford, Conn.—*Oil Cup.*—May 28, 1867.—The valve closes the inlet aperture when oil is to be ejected, and at other times allows drip to pass into the can.

Claim.—The combination of the passage a, valve d, guide i, and rod e, all arranged to operate substantially as and for the purpose described.

65,127.—JOHN F. SHEARMAN, Brooklyn, N. Y., assignor to E. S. DODGE & Co., New York, N. Y.—*Register Points for Printing Apparatus.*—May 28, 1867.—The guide point is automatically raised and depressed by a fixed mechanism beneath the circular rotatable plate. It is held in a case adjustable along a slot running radially from the center to the periphery of the plate, and the point is operated and its case clamped by plates running beneath the sides of the slot and pivoted to the said plate.

Claim.—First, the case K, inclosing the point I, and open on one side to allow the operation of the edge of the blade G', or its equivalent, so as to operate the point therein in any position in the slot, substantially in the manner and for the purpose herein set forth.

Second, in combination with the above, the clamp L, and adjusting means N, or its equivalent, adapted to be conveniently operated from above the feed board, so as to set the point in the desired position in the slot c, substantially as herein specified.

Third, adjusting the turning plate C, by operating from the upper side, all substantially in the manner and for the purposes herein set forth.

65,128.—P. T. SMITH, Salem, Ohio.—*Planing Machine for Wood.*—May 28, 1867.—To plane, groove, and tongue flooring from stuff of double thickness. The board is run between the permanent and the adjustable rollers, is planed on each side, the edges planed, is ripped by the circular saw, and discharged.

Claim.—First, the adaptable shaft G, dowel points or clutch c', socket joint a, in combination with the feed rollers E F, and springs K, as and for the purpose substantially as set forth.

Second, the vertical revolving cutters Q, spring guides d' and f, as arranged in combination with the saw g, for the purpose and in the manner described.

65,129.—ALFRED SOWER, New York, N. Y.—*Kettle.*—May 28, 1867.—The caloric current passes through pipes leading up from the bottom of the kettle

to the chamber within and thence outward by a flu to a place of discharge.

Claim.—The chamber E, in combination with the tubes C, and pipes F G, substantially as herein shown and described, for the purpose specified.

65,130.—IRWIN H. SPELMAN, Baconsburg, Ohio.—*Sheep Shearer.*—May 28, 1867.—The knife is set obliquely in the head of the stock and cuts the wool by a forward and slightly lateral motion, while the teeth of the comb gather it to the knife.

Claim.—The combination of a shearer for the purpose and in the manner as substantially described, as a new article of manufacture.

65,131.—EDWARD F. STEPHENS, Towanda, Pa.—*Card or Label Holder.*—May 28, 1867.—The metallic plate is cut so that a point at each corner is turned back for attachment to a drawer and the sides and one edge are bent over to secure the label.

Claim.—The form of the plate as cut of one piece of metal, the points marked C D E and F, which secure the holder to the drawer, or so forth, without the use of nails or other means of fastening, and the flanges G H and I, so turned as to hold the card or label and permit the same to be changed without detaching the holder.

65,132.—JEREMIAH STEVER and JOHN A. WAY, Bristol, Conn.—*Machine for Making Ferrules.*—May 28, 1867.—The blank is cut by shears and bent around its forming pin by pressers worked by cams; the ferrule is delivered ready for brazing.

Claim.—First, the reciprocating bending dies J J, slides L L, and mandrel R, combined and arranged for joint action, substantially in the manner described.

Second, in combination with the above presser R'', substantially as and for the purpose described.

65,133.—ISAAC STRAUD, Kenton county, Ky.—*Grinding Mill.*—May 28, 1867.—By means of the additional tram-support the millstone is perfectly reset in its normal position in train with the runner, after it has been removed and dressed.

Claim.—The bolt b, when used in combination with trambolts a a a, for the purposes substantially as described.

65,134.—R. A. STRATTON, Philadelphia, Pa.—*Mangle.*—May 28, 1867.—The clothes are pressed twice in passing between the three rollers which are adjustable by bolts, by which their journal bars are held together. A vertical shield is placed between the upper and under rollers, and faces toward the middle roller.

Claim.—First, the combination of the rollers E E', secured to the adjustable spring standards D D', and the roller F secured to the spring standard D', the whole being constructed and arranged as and for the purpose set forth.

Second, the shield m, arranged in respect to the rollers, as and for the purpose described.

65,135.—D. B. STROPE, Fort Wayne, Ind.—*Pneumatic Spring.*—May 28, 1867.—Air is used as the elastic medium, and oil or other liquid as a cushion for the piston rod when depressed to its ultimate limit. The air and oil are introduced into the outer cylinder through a cock and valve, and pass from thence to the hollow piston.

Claim.—First, the construction and arrangement of the hollow piston in its relation to the oil contained in the reservoir or outer cylinder, in the manner and for the purpose herein described.

Second, the combination of the packing D, elastic packing I, metallic packing ring E, and elastic flange or packing F, with the gland C and piston B.

Third, the combination of the studs K, cylinder A, and piston B, substantially as shown and described.

Fourth, the combination of the cock G, valve M, and cylinder A, when arranged substantially as shown and described.

65,136.—DEXTER SYMONDS, Lowell, Mass., assignor to himself, BENJAMIN WOODWARD and M. S. MARSHAL.—*Oil Still.*—May 28, 1867.—The oil and lime water are introduced from separate elevated reservoirs into the still, which has horizontal screws

to check foaming. A curved pipe extends from the cover of the still to the top of the condenser and nearly to the bottom of the latter. The still has cocks for drawing off oil and water respectively.

Claim.—First, in stills for deodorizing and purifying oils, where the substance or material used and the process of deodorizing and purifying are herein described.

Second, the employment of one or more screens, in the manner and for the purpose substantially as set forth.

Third, the employment of a screen or screens in any still where the substance or material under operation is liable to foam or rise, as set forth.

65,137.—DEXTER SYMONDS, Lowell, Mass., assignor to himself, BENJAMIN WOODWARD and M. S. MARSHAL.—*Purifying and Deodorizing Oils.*—May 28, 1867.—To 30 gallons of crude oil, in a still, add 10 gallons of lime water. Distill and collect the lighter oil and afterwards remove the heavier.

Claim.—In deodorizing and purifying hydrocarbon or other oils, the use of the substances or materials herein specified and in the manner set forth.

64,138.—TIMOTHY F. TAFT, Shrewsbury, Mass., assignor to AUGUSTUS RICE, Worcester, Mass.—*Machine for Cutting Sheet or Bar Metal.*—May 28, 1867.—The prominent parts of the head and bed pieces are connected by a bolt to give strength and rigidity.

Claim.—The application to the lock shears above described of the two arms J J with bolt K and nut L, or their equivalents, substantially as described.

65,139.—C. S. TOMS, Utica, N. Y.—*Composition for Cleaning Metals, Wood and other Articles.*—May 28, 1867.—A detergent composed of borax, 10 lbs.; oil, 6 galls.; and water, 30 galls.

Claim.—The composition of matter substantially as herein described, with and without the Fuller's earth.

65,140.—GARRET VLIET, Milwaukee, Wis., assignor to WM. VLIET, Green Lake county, Wis.—*Gate for Water Wheels.*—May 28, 1867.—The metallic cylinder has openings through which pass curved plates by which the course of the water is directed. The cylinder is movable on its axis to vary the area of aperture.

Claim.—Solid metal gate C, with water ports through its metallic water guides D projecting through the ports in gate C, and curved at their inner ends to conform to the shape of the wheel, for the purpose of giving the water the proper direction, metal rings E and F, bolts G, and pinion H, all arranged and combined substantially as and for the purpose described.

65,141.—ANNA WEISSENBORN, New York, N. Y.—*Tuck Marker or Creaser for Sewing Machines.*—May 28, 1867.—The marking wheel has a bearing in a standard rising from a plate which is adjusted at right angles to the guide edge of the gauge on the cloth plate. It is set in position by a thumb screw, and its pressure determined by the rock shaft whose outer screw bears upon the cross-plate.

Claim.—First, the combination of a creasing or marking wheel or roller A¹⁰, sliding in unison with a sliding blade A¹², when applied to a sewing machine, in such a manner that the creasing or marking can be done during the process of sewing, substantially as described.

Second, for giving the downward pressure of the creasing wheel against an edged or grooved instrument attached to the sliding blade A¹², the employment of a spring or set screw or a lever, substantially the same as set forth.

65,142.—JOHN A. WHIPPLE, Cambridge, Mass.—*Combined Match Box and Paper Holder.*—May 28, 1867.—The case contains a hinged candle socket and a place for matches.

Claim.—The combination of the casing A, the match holder B, and hinged socket S, substantially as and for the purpose specified.

65,143.—MOSES G. WILDER, West Meriden, Conn.—*Punching Press.*—May 28, 1867.—For the purpose of varying the extent of motion of the slide which carries the upper die, the slide-carrying lever is mounted upon a fulcrum which is elevated by an

eccentric thereon rotating within the bearing of the lever.

Claim.—First, the combination of the eccentric G, stock A, shaft D, lever E, arranged and operating substantially as described.

Second, the combination of the eccentric G, stock A, shaft D, levers E K, arm L, with the wheel H J, substantially as and for the purpose described.

65,144.—ALBERT S. WILKINSON, Pawtucket, R. I.—*Horseshoe.*—May 28, 1867.—A continuous clip surrounds the hoof. The shoe is adjustable. An elastic connection between the heels, by a steel spring or otherwise, aids in expanding the hoof.

Claim.—First, an elastic or spring connection L for connecting the heels of expanding shoes, substantially in the manner and for the purpose set forth.

Second, in a jointed horseshoe as described, and having a continuous clip, the toe clip a and heel clips e e, provided with the projecting arms e² e³, in combination with the elastic spring connection L, substantially as described.

65,145.—ALBERT S. WILKINSON, Pawtucket, R. I.—*Horseshoe.*—May 28, 1867.—The shoe is expandible and has an attaching band passing over the hoof.

Claim.—First, in double shoes an expansion point which consists in slitting the upper and lower plates laterally so as to break joints, so that the toe clip acts as a spring joint to allow the heels of the shoe to expand laterally, substantially in the manner and for the purpose set forth.

Second, the double shoe a a having an expansion joint as described, in combination with the toe clip B provided with a loop c, and retaining bands f f, substantially as described.

Third, the double shoe a a having an expansion joint as described, in combination with the toe clip B provided with a loop c, retaining bands f f, and heel rests j j, the whole being constructed and operating substantially in the manner and for the purpose set forth.

65,146.—J. D. WINSLOW, Wilmington, Del.—*Sash Tightener.*—May 28, 1867.—A pin is driven into the jamb, and a wedge being inserted between the pin and the sash holds the latter snugly against the parting strip and prevents rattling.

Claim.—Attaching to window sashes the wedge-shaped piece a, together with the pin or stop b, as shown in the drawings and herein described as a sash tightener, to exclude wind and storms and prevent the sash from rattling.

65,147.—J. E. WINANTS and J. F. GRIFFEN, New York, N. Y.—*Apparatus for Distilling Turpentine.*—May 28, 1867.—The material is received into a supply hopper from whence it is automatically fed as it melted, strained and distilled. The products of distillation pass off in one direction to constitute spirits of turpentine, and the residuum of rosin passes off in another direction.

Claim.—Melting the lower portion of the mass of crude material in the bottom of the supply tank or hopper, and there partially straining it, substantially in the manner described and for the purposes set forth.

Also, the employment within a closed chamber D of a steam-heated strainer F, constructed and operating substantially as described for the purposes set forth.

Also, the employment in combination with the chamber D and steam-heated strainer F of one or more auxiliary sieves or strainers, substantially as described.

Also, the employment, in combination with a strainer confined within a chamber, of a cleaning device or scraper arranged to be operated from the outside of the chamber, substantially as described.

Also, making the strainer chamber D with windows, as and for the purposes specified.

Also, the employment within a closed vessel K, of one or more steam-heated disks or evaporators, when formed with a scroll-shaped or helical groove in the passage of the liquid, substantially as described, for the purposes set forth.

Also, forming the still with windows, substantially as described, for the purposes set forth.

Also, supplying the superheated steam directly to the evaporators, carrying it thence to the steam strainer, and lastly to the melting worn, so as to heat these several devices to different temperatures, as hereinbefore described, for the purposes set forth.

Also, the combination or combined arrangement of the supply hopper, melting coil, strainer, and still with the heating medium, when operating together in substantially the manner hereinbefore described, for the purposes set forth.

65,148.—GEORGE L. WITSL, Philadelphia, Pa., assignor to himself, WILLIAM DARMON, and GEORGE W. GRIFFIN, same place.—*Clothes Wringer.*—May 28, 1867.—The roller journals have bearings in frames, which are pivoted together, and have downward arms, embracing the tub side, so that the pressure of clothes between the rollers serves to clamp the frame to the tub.

Claim.—First, the combination of the roller A, spur wheel G and frame F, including the jaws F² F³ and the roller A', adjustable pinion G' and frame D, including the jaws D² D', said parts being respectively constructed, and the whole arranged to operate substantially as and for the purpose set forth.

Second, the arrangement of the rollers at A and A', when both are actuated positively, frames D and F, including the jaws F² F³ and D² D', block D', stems D² and spiral springs E, substantially as set forth.

Third, in combination with the rollers A and A', the spur wheel G and slotted pinion G', cross-piece H rigidly attached to the shaft of the upper roller and washer I, substantially as and for the purpose set forth.

65,149.—S. W. WOOD, Cornwall, N. Y.—*Grain Conveying Machine.*—May 28, 1867.—The grain is weighed in an air-tight receptacle, and by pressure of air is forced from the same through discharge pipes.

Claim.—A reservoir B and weighing apparatus or scales II, in combination with the receiving and conveying pipes or passages C D, air pump A and the governing valves, constructed and arranged to operate substantially as and for the purposes herein specified.

Also, the perforated partition or screen L, in combination with the reservoir B, receiving and conveying pipes C D, air pump A and valves, substantially as and for the purpose herein set forth.

Also, the devices or their equivalents for the introduction of air into the receiving and conveying pipes C D, in addition to that introduced with the grain, substantially as and for the purpose specified.

Also, the arrangement of the devices, or the equivalent thereof, for introducing grain into a conveying pipe of passage, substantially as shown in Figs. 3 and 4, and for the purpose herein specified.

65,150.—CHARLES R. ABBOT, Elmira, N. Y.—*Prop for Carriage Tops.*—May 28, 1867.—The shank of the prop is made in two pieces, lapping past each other. The outer is removable, while the leather is put on, and is then replaced and fastened.

Claim.—First, the shank B B', when made in two parts, and constructed and operating substantially as and for the purposes set forth.

Second, the shank B B', in combination with plate A, ferrule C and screw D, substantially as and for the purposes set forth.

Third, securing the shank B B' and ferrule C together, by means of tongue and groove o and pins and holes v, substantially as and for the purposes set forth.

65,151.—JOHN D. ANDERSON, CORTY, Pa.—*Car Coupling.*—May 28, 1867.—When uncoupled the link is thrown up, its curved end projecting in front of the draw-head. A plate on the draw-head of another car impinges against the projecting ends, and oscillates the link to engage it with the catch.

Claim.—The construction and arrangement of the link B, fitting over the hooks C upon the upper side of the draw-heads, said link catching over the pins g, and prevented from slipping when in a vertical position, by means of the circular projections h, and coupled by means of the bent arm d striking the projection a upon the draw-heads, as herein shown and described.

65,152.—ABRAM P. ANTHONY, Morrison, Ill.—*Clothes Dryer Attachment for Stove Pipes.*—May 28, 1867.—When the ring is turned downward its inner surface pressing upon the outside of the divergent loops forces them together, and clasps the wires around the pipe.

Claim.—The wire B forming the ring B² and loops B¹, in combination with the ring C, by means of which it may be clamped upon a stove pipe, substantially as and for the purpose set forth.

65,153.—ELLCOTT D. AVERELL, New York, N. Y.—*Lath for Plastering.*—May 28, 1867.—The countersunk apertures are penetrated by the mortar, which forms a bond therein.

Claim.—A lath constructed with countersunk apertures A', substantially as herein set forth for the purpose specified.

65,154.—THOMAS BANTA, Hoboken, N. J.—*Rotary Steam Engine.*—May 28, 1867.—The hollow arms rotate in closed cylinders, and their shafts are so connected as to be continuous, the packing of the series being performed at one operation. The steam passes in at the axis of each, and issues at a tangent, driving the wheel by reaction on the principle of the coilpipe.

Claim.—First, the combination of the rings R S T U, with the stuffing boxes L M N O, shafts G H I J, radial arms D E F and flange V, substantially as herein shown and described, and for the purposes set forth.

Second, the combination of the flanged ring W and rods X, with the shaft J, flange V and flanged end of the packing box O, substantially as herein shown and described, and for the purpose set forth.

65,155.—JOHN BARBIER, Boston, Mass.—*Clasp for Securing Shirt Collars.*—May 28, 1867.—Two plates are pivoted together near their midlength, and have a spring between their lower ends, which drives the projection of the rear plate through the collar button-holes and a perforation of the front plate. A button on the rear plate engages the shirt. A socket on the front plate gives place of attachment for the bow.

Claim.—The within-described collar clasp, consisted of the two plates a a', when pivoted together at or near the center, in combination with a spring e, one of the plates being provided with a projection f, which passes into or through an opening in the extremity of the opposite one, and the clasp being attached to the shirt by means of a stud g, all arranged and operating substantially as described.

Also, in combination with the above the socket h for receiving a pin projecting from the cravat or tie, substantially as set forth.

65,156.—IRA N. BEVANS, Terryville, Conn., assignor to ELI TERRY, Terryville, Conn.—*Apparatus for Tempering Steel Springs.*—May 28, 1867.—By the feed rollers the spring is drawn through the bath of molten lead at an equable rate, securing even temper.

Claim.—The feed rollers C, in combination with the vessel A and receiving drum D, substantially as and for the purpose set forth.

65,157.—EZRA BIRME, Dayton, Ohio.—*Basket for Feeding Turred Corn Cobs to Furnaces.*—May 28, 1867.—The basket and its hinged lid are of woven wire. The lid is raised by a chain, and held shut by a catch, whose hold is insufficient to keep the lid closed when inverted over the furnace.

Claim.—The cob-kindling basket, constructed substantially as herein described and for the purpose specified.

65,158.—HIRAM BOYS, Rushville, Ind.—*Cultivator.*—May 28, 1867.—The plows are regulated by lever, or by the adjustment of the seat, being swiveled to the frame in front and suspended by chains from rollers on the frame.

Claim.—First, the frame A, as constructed with adjustable tail piece a, arms b, with swivels for connecting the shovel beams and rollers E, with chains for attaching the shovel bars, when combined, arranged and operating in the manner and for the purposes herein specified.

Second, the beams D D, shovel bars f f', and shields

c e, connected by the adjustable bars *m m*, in the manner and for the purposes set forth.

65,159.—WILLIAM BRIGGS, Bristol, R. I., assignor to himself and THOMAS HOLMES, same place.—*Molasses Vessel.*—May 28, 1867.—The wooden bucket has a tight cover and a spigot, the lever of which has a notch to receive the end of a pivoted arm to prevent accidental opening.

Claim.—As a new article of manufacture, a pail or bucket, constructed and furnished as herein described, in combination with the gate *o*, as herein set forth and for the purpose specified.

65,160.—A. BRINCKMANN, New York, N. Y.—*Faucet.*—May 28, 1867.—The spring faucet has two stop washers. The application of one allows the entire closing of the faucet; that of the other admits the flow of a slight stream therethrough to prevent freezing.

Claim.—The tube A, spigot B, spring D, within the case C, in combination with the washers F G, having stops *c d*, as herein described, for the purpose specified.

65,161.—WALTER BRITTON, Abington, Ill.—*Bolt Cutter.*—May 28, 1867.—The pivoted jaws with transverse cutters are operated by cam levers to cut the rivet.

Claim.—The guide A, bars B B', connected by a pivot-bolt *b* at one end, and provided with cutters *c e* at the opposite end, and the levers D D, provided with eccentrics *g g*, all being combined and arranged substantially in the manner and for the purpose set forth.

65,162.—JAMES R. BROWN, Boston, Mass., assignor to himself and W. S. LOVELL, Cambridgeport, Mass.—*Pipe Wrench.*—May 28, 1867.—The jaws are attached by a strap, and have an adjustable spring pivot by which they may be arranged to hold any size of pipe.

Claim.—The combination of the staple or clasp, the series of holes and the fulcrum pin and its spring, and their arrangement with the two crossed-jaw levers, substantially in manner as specified.

65,163.—MELLISSA E. BULKLEY, Providence, R. I.—*Corset Clasp.*—May 28, 1867.—A metallic shield on the stud is interposed between the clasp-eye and the fabric so as to prevent wear of the latter.

Claim.—The use of the shield *s*, or its equivalent, in combination with the clasp, constructed substantially as described for the purpose specified.

65,164.—ISRAEL L. BULLOCK, Marcy, Ind.—*Horse Rake.*—May 28, 1867.—The rake head is of the simplest form of horse rake. It is kept in gathering position by pressure of the feet on the holding frame, and the catch pawls are dislodged from their catches to allow semi-rotation by forward pressure of the foot on their frame.

Claim.—The levers J J, having elastic pawls L L attached in combination with the shaft M, provided with the foot-boards *j j'*, and connected with the levers J J, substantially as and for the purpose set forth.

65,165.—HUBERT BURGESS, San Francisco, Cal.—*Pencil Sharpener.*—May 28, 1867.—The inner part of the box which slides into the other has within it a file to sharpen pencils, the box catching the dust.

Claim.—The case or box A, tray B, and file C, for sharpening pencils, substantially as shown and described.

65,166.—H. BURK, Mineral Point, Ohio.—*Converting Motion.*—May 28, 1867.—The rotating cam wheel has a tri-looped cam groove on each side, traversed by rollers pivoted to the head of the pitman rod, anti-friction rollers running on guide-plates of the bed-piece. Three reciprocations are given to the rod to each rotation of the wheel.

Claim.—The construction and arrangement of the pitman D, the legs *a b* of which straddle the wheel C, and are provided with rolls *d*, the former running in the groove E of the said wheel, and the other running on the metallic plate *f* of the bed A, substantially as described and for the purpose specified.

65,167.—F. CAJAR, New York, N. Y.—*Car Spring.*—May 28, 1867.—The frusto-helical plate has inner and outer flanges on its edges, to stiffen the same and to form abutments when pressed home.

Claim.—The improvement of a coiled or spiral spring and buffer for cars, &c., by providing the lower margins of the coil (*viz.*, of their individual cones) with the ribs or projections *a* and *b*, for the purpose and substantially as described above.

65,168.—JOHN S. CAMPBELL, Newton, N. J.—*Vehicle.*—May 28, 1867.—Explained by the claims and illustration.

Claim.—First, the carriage or sleigh body A, when made of hard rubber, and provided with flanges *b* and *c*, and cross-pieces *d*, substantially as and for the purpose herein shown and described.

Second, the running gear of wagons and sleighs, when made of rubber, substantially as herein shown and described.

65,169.—EDWARD CARD, North Providence, R. I.—*Pattern Lifter.*—May 28, 1867.—The lower ends of the steel arms have outer projections to engage the under countersunk holes of the lifting plate; they are forced apart by the wedge-shaped end of the descending screw which works in a screw socket at the upper part of the bend.

Claim.—The combination of the steel arms D D, and screw spindle wedge E, constructed as described.

Also, the combination of the device above set forth, with the plate A, having a hole through its center countersunk on one side, as herein described and set forth.

65,170.—E. M. CARPENTER, Elkhart, Ind.—*Liniment.*—May 28, 1867.—Ox gall, 1 gallon; kerosene oil, $\frac{1}{2}$ gallon, and alcohol, 1 gallon.

Claim.—The liniment compounded of the ingredients and for the purpose substantially as herein described.

65,171.—RILEY W. CARPENTER, Brattleboro, Vt.—*Melodeons and other Wind Instruments.*—May 28, 1867; antedated May 23, 1867.—The keys are rounded at the point where they impinge on the frame, and have diagonal connecting rods to the tremolo valve so that a rolling motion of the key will raise the valve. The keys are straightened up by a side spring pin.

Claim.—First, the arrangement of the tremolo valve in or on the swell, substantially as specified.

Second, the connection of the tremolo valve with the key or keys of the instrument, in such manner as to bring it under perfect control of the finger by the independent action of the latter on the key, essentially as herein set forth.

65,172.—JOHN CARROLL, New York, N. Y.—*Bath Tub.*—May 28, 1867.—The bottom of the tub is segmental in transverse section, and the tub has a casing of thin wood bent around it. The sides and one end flare sufficiently to allow package in nests.

Claim.—First, the bath tub, consisting of the body *c*, with a half circular bottom, head rest *a*, and foot rest *b*, all composed of sheet metal, and surrounded by a layer B of thin wood, in such a manner as to conform to the shape of the inside of the tub, the wooden foot board C, adjustable support D, and metallic lining *g*, substantially as herein shown and described.

Second, the thin covering B of wood, when laid around the body of a bath tub, with semicircular bottom, substantially as and for the purpose herein shown and described.

65,173.—S. E. CHUBBUCK, Roxbury, Mass., assignor to JOSEPH H. CHADWICK, same place.—*Machine for Cutting Sheet Lead.*—May 28, 1867.—The sheet lead passes over a roller bed and a grooved bar; above the latter traverses a cutting disk journaled in a spring arbor, which is socketed in a suspended carriage driven by rack and pinion.

Claim.—First, the arbor G, provided with the rotary cutter H, and adjusted in the hollow shank B of the arms C, by means of the spring I, and set screws J K, substantially as described for the purpose specified.

Second, in combination with the above the transverse racks E, guides D D, in which the cross-heads B slide, pinion F, and transverse bar L, substantially as described for the purpose specified.

65,174.—HENRY C. COFFMAN, Washington Court House, Ohio.—*Fluid for Disinfecting and Embalming.*—May 28, 1867.—Distilled water, 1 gallon; carbolic acid, nitrate of potash, and alcohol, each 4 oz.

Claim.—A disinfecting and embalming compound, prepared substantially as described and for the purpose set forth.

65,175.—ALEXANDER ANGUS CROLL, London, England.—*Treatment of Sulphate of Alumina.*—May 28, 1867.—For neutralizing free acid resulting from the manufacture of sulphate of alumina. Caustic lime or carbonate of lime is added to it before it has cooled down to 170° Fah. For making a soluble sulphate of alumina, take sulphuric acid five parts, diluted with water, to which add four pounds of dry and finely divided aluminous clay.

Claim.—First, the employment of carbonate of lime with the sulphate of alumina when the latter is in a heated state, substantially as herein described.

Second, the treatment of the roasted aluminous earth or clay with hot oil of vitriol, substantially as herein described.

65,176.—LUTHER C. CROWELL, West Dennis, Mass.—*Constructing Paper Bags, &c.*—May 28, 1867.—A thin strip of metal is pasted horizontally in a fold at one side of the bag top. When filled, the edges are laid together parallel to this strip, are rolled on the same and the ends of the roll bent inward.

Claim.—First, the combination of the strips of tin or iron with wrapping paper, or its equivalent, when cemented, pasted, or otherwise securely connected together, and used as a self-sealing wrapper, as a new article of manufacture.

Second, the paper-bag M, in combination with the opening O, and thin strip of tin or folder A, constructed and operating substantially in the manner and for the purpose herein shown and described.

65,177.—EPHRAIM CULVER, Shelburne Falls, Mass.—*Cutter, Grater, and Sharpener.*—May 28, 1867.—The grater roller armed with longitudinal saw plates and the cutter cylinder armed with knives are upon one shaft, but in separate compartments. The grindstone is on a separate shaft, and the shafts are rotated by a common motive wheel actuated by a winch.

Claim.—The arrangement and combination of the revolving cylinder c, having its projecting and transverse saw teeth of unequal length, and the cylinder b, with the knives attached to it, and the grindstone d, substantially as and for the purpose described.

65,178.—WILLIAM H. CUMMINGS and ISAAH BABCOCK, Boonsboro, Iowa.—*Gauge for holding Clapboards.*—May 28, 1867.—The fixed dog takes under the edge of a board and the spring dog is depressed by a lever to engage the face of a board below and give support to a board above.

Claim.—The combination of the adjustable bars a b and d, the fixed dog g, and the spring dog h, and the lever k, or their equivalent devices, arranged and operating substantially as and for the purposes herein described.

65,179.—OSCAR A. DAY and GEORGE W. BISHOP, Saratoga Springs, N. Y.—*Composition for Coating Roofing, &c.*—May 28, 1867.—Roofing composition. An inner coat is composed of sand 3 and cement 1 part, with sufficient lime and water to reduce to a mortar. The outer coat is composed of cement, 4; ground clay, 2; fine sifted sand, 2; coal tar, 3; and rubber compound, 1 part. The rubber compound has rubber or gutta-percha, 5; tallow, 2; and spirits of turpentine, 1 part.

Claim.—The combination substantially as herein described and for the purpose specified.

65,180.—JOSEPH A. DAYTON, New London, Conn., assignor to himself and JOSEPH STARR, same place.—*Hoisting Apparatus.*—May 28, 1867.—The screw of the crank shaft engages a suitable gear

wheel, which is connected by cog gearing to the barrel of the windlass.

Claim.—An improved hoisting apparatus, formed by the combination of the chain wheel B, shaft D, gear wheels E F, shaft G, gear wheel H, endless screw I, shaft J, and cranks K, or their equivalent, with each other and with the frame A of the machine, substantially as herein shown and described and for the purpose set forth.

65,181.—FREDERICK W. DEVOE, New York, N. Y.—*Metal Can and Box for Paints and other Materials.*—May 28, 1867.—An inwardly-projecting bead holds the gasket on which the cover rests. The cover has notches into which the rim of the metallic can is pressed to fasten the cover.

Claim.—First, the can constructed with the internal swage a at the inner part thereof, substantially as and for the purpose specified.

Second, the combination of the rebate b of the cover B, the internal swage a of the body of the can, and the gasket c, substantially as and for the purpose specified.

Third, the recesses d in the cover B, in combination with the upper edge of the body A and the internal swage a, substantially as and for the purpose specified.

65,182.—GEORGE F. DEITZ, Burlingham, N. Y.—*Attaching Thills to Vehicles.*—May 28, 1867.—The two ears of the clip are on separate pieces attached by transverse bolts, permitting their lateral adjustment when the joint wears.

Claim.—A carriage clip formed in two parts so as to be adjustable, when so constructed that one part can be moved on the other without loosening the clip on or detaching it from the axle.

65,183.—WILLIAM H. DOANE and JOHN RICHARDS, Cincinnati, Ohio.—*Shaft Coupling.*—May 28, 1867; antedated February 16, 1867.—The conical sleeves have a longitudinal split to allow their contraction upon the shaft by the action upon them of the outer sleeves. One of the latter has an extension, screw-threaded within, to engage the annular nut, which engages a flange on the other part.

Claim.—First, the ring nut c for connecting the conical compressing shells b b in a shaft coupling, in the manner and for the purposes specified.

Second, the sleeve a, compressing shells b b, and ring nut c of a shaft coupling, combined and operated in the manner and for the purpose set forth.

65,184.—WILLIAM C. DURANT, West Troy, N. Y.—*Base Burning Stove.*—May 28, 1867.—A series of apertures, alternating with the annular plates which compose the fuel reservoir, permit the heated gases to escape from the latter and thus prevent the ignition of the fuel therein. The annular plates have a tapering shape to deflect the escaping gas and induce its exit from the reservoir.

Claim.—A fuel reservoir of "base-burning" stoves having a series of horizontal apertures or openings a a formed in and through its sides, said series of openings or apertures extending in succession from its base part upward to its top part, in manner substantially as herein described and for the purpose set forth.

Also, in combination with said series of apertures or openings a a, and respectively with each other, a series of deflector plates or bands G, said series extending in alternate succession with said apertures from the base part or bottom of the reservoir upward to its top, in manner substantially as herein fully set forth and for the purpose specified.

65,185.—J. W. DURGIN, Bangor, Me., assignor to E. Q. NORTON and A. H. NORTON, same place.—*Machine for Cutting Slates.*—May 28, 1867.—The curved knives are hinged at their ends and connected to levers by which they are actuated. They work on a frame of similar shape.

Claim.—The cutting of slate for roofing purposes, composed of a knife of a shape corresponding to that in which it is designed to cut the slate, and pivoted to the end of a bed piece of a form corresponding to that of the knife, and of such dimensions that the knife may work over it with a lever or treadle applied

to the knife, all arranged substantially in the manner as shown and described.

65,186.—E. J. EAMES and C. A. SEELY, New York, N. Y.—*Composition for Soap.*—May 28, 1867.—A disinfectant and deodorizer, such as carbolic acid, is mixed with the soap, or with one of its component parts, before manufacture.

Claim.—A disinfectant soap compounded of the ingredients as above set forth.

65,187.—JONATHAN EMERY, Cedar Falls, Iowa.—*Artificial Leg.*—May 28, 1867.—The frame has two side bars extending up and attached to the leg which are hinged in the foot and have bearings before and behind the pivot. The back plate of the heel is fitted to slide on the convex part above it.

Claim.—First, the construction of the frame D D in the form shown in Fig. 5 of the drawings, and so that it is applicable to the standard *b* on the steel sole plate *c*, and will afford a bearing forward of and in rear of the axis of motion of the leg *A*, and also serve as the means for connecting the leg to the foot, all in the manner herein described and shown.

Second, the construction of the heel extension *a* and concave ankle portion *b* upon the leg *A*, in combination with the heel spring *d*, frame D, and foot section B, substantially as described.

65,188.—JOHN G. ERNST, Baltimore, Md.—*Tobacco Pouch.*—May 28, 1867.—The mouth of the pouch opens to embrace the pipe mouth and is afterwards closed.

Claim.—The elongated hinges *d d* of frame B, in combination with spring *c*, or its equivalent, the concave metal plate D and nipple E, the whole secured to bag or pouch A, in the manner described and for the purpose specified.

65,189.—JACOB ESLAMAN, Belleville, Ill.—*Wheat Dampener.*—May 28, 1867.—The wheat is damped by a jet of steam on its way to the millstones, the object being to toughen the bran and enable it to be rolled off nearly entire.

Claim.—The combination of the conveyor-screw B and mixing trough A with the steam dampening apparatus, consisting of the spout *c* and steam pipe E, arranged in manner described.

65,190.—O. B. EVANS, Buffalo, N. Y.—*Tanning.*—May 28, 1867.—The cleaned hides are immersed in a composition of warm soft water, salt, borax, salt-peter, acetic acid, and nitric acid. Draw and drain and then immerse in extract of nut galls; drain and return to first composition and alternate six times. Thicker hides after cleaning, hairing, and breaking, and after treatment in first composition, are immersed in a decoction of bonceset, melted catechu, and extract of bark. Then return to first composition and alternate between the compositions.

Claim.—Compounds or solutions for tanning hides and skins, composed of the ingredients specified, mixed together in or about the proportions described, substantially as and for the purposes set forth.

65,191.—JEROME FASSLER, Springfield, Ohio.—*Machine for Drilling Harvester Guard Fingers.*—May 28, 1867.—The guard fingers are clamped to their bar and drilled simultaneously by a series of longitudinally adjustable drills. The slide table has an automatic upward feed motion.

Claim.—The main frame A, constructed as described, and mounted upon the hollow pillars B B and bed plate C, as and for the purpose set forth.

Also, the crank S connecting clutch rod R and lever T in combination, the two former being behind and the latter in front of the frame, as and for the purpose shown and described.

Also, arranging the stop lever T and hand wheel W with the other operative mechanism, in the manner and for the purpose shown and described.

Also, the construction and arrangement of the plug *k* and follower *n*, in the end of a hollow drill stock, as described.

Also, the steel pattern bar *p* with the clamps *q q*, as and for the purpose set forth.

Also, the trough *o*, constructed as described and for the purpose set forth.

65,192.—JEROME FASSLER, Springfield, Ohio.—*Machine for Milling Harvester Guard Fingers.*—May 28, 1867.—The rotating cutter shaft is mounted on a vertically moving carriage actuated by automatic feed which is detachable at will. The shaft bearings are between the gearing and cutter heads. The cutters are made in sections to enable the formation of shoulders upon the faces formed.

Claim.—The combination of the main shaft G which carries the cutters and the counter shaft H which receives motion from the driving power, both mounted upon the carriage F with the feed shaft S, constructed and arranged substantially in the manner shown.

Also, the arrangement substantially as shown of the main shaft G and counter shaft H, both upon the vertically moving carriage F, cutters O O, gearing J K, and pulley L, all outside of the bearings of said shafts.

Also, securing the guard fingers *e* to the holding bed *g*, in the manner shown, to hold them firmly while being faced off by the cutters.

Also, the combination of the detachable holding bed *g* with the carriage P, whereby duplicate holders may be used, and one set being prepared while another is being operated upon, in the manner shown and described.

Also, the detachable holding bed *g*, carriage P, and feed screw Q, combined with the hand wheel R, worm S, and driving band T, all combined for joint operation substantially as shown.

Also, the combination of the set stop Y, let-off device W X Z, and dropping box V, to stop the movement of the carriage P at the desired point.

Also, the detachable holding block *g* in which two or more guard fingers may be secured at one time, in combination with the carriage P and cutters O of a milling machine.

65,193.—JEROME FASSLER, Springfield, Ohio.—*Machine for Slotting Harvester Guard Fingers.*—May 28, 1867.—The longitudinally and transversely adjustable carriage has suitable clamps for the guard fingers, and an automatic feed by the impact of the lower bar of the sash against a lever which, by a pawl, operates a ratchet wheel on the feed screw. The slide bars of the sash extend through the table.

Claim.—Securing the guide rods, constructed as described, to the table A, substantially in the manner shown and set forth.

Also, the rods L L to connect the heads K K of the saw frame, in connection with the independent guide rods H H, in the manner shown and for the purpose set forth.

Also, the straining heads M, constructed as described, with the set screws O O Q and the pin P passing through a horizontal slot, for the purpose set forth.

Also, the holding block *g*, constructed as described, to hold the guard finger *h* while being slotted, as set forth.

Also, in combination with the holding block *g*, the point holder *f*, all constructed as and for the purpose set forth.

Also, the carriage T and holding blocks *f* and *g*, combined and arranged as set forth.

Also, the combination of the carriage T, holding blocks *g* and *f*, and the saw frame K L, when the carriage and holding blocks are located and arranged between the parts of the saw frame, as set forth.

Also, the arrangement of the shaft V, pawl W, and crank bar Y with the ratchet wheel U and head K of the saw frame to produce an automatic feed for the carriage T, as set forth.

Also, in combination with the automatic feed motion herein described, the lever *b*, spring *c*, latch *d*, and pin *e*, for the purpose of disconnecting the said feed and arresting the forward motion of the carriage T, as and for the purpose set forth.

65,194.—JULIUS FISCHER, New York, N. Y.—*Fire Escape and Alarm.*—May 28, 1867.—The chain ladder is wound upon the windlass on the roof and is unwound by a chain reaching to the ground. The windlass is connected to a bell. The curved ends of two springs engage the lower round when elevated and prevent accidental unwinding.

Claim.—First, the combination of an alarm bell or of alarm bells with a life-saving apparatus, connected in such a manner that the life-saving apparatus

when being brought in readiness to be used will set the bell or bells in motion, for the purpose as herein fully described.

Second, in combination with the above a chain attached to the ladder by means of which said ladder may be unwound from a windlass, for the purpose as herein described.

Third, the combination of a sliding frame with a windlass and chain ladder, the whole being constructed and operating as and for the purpose herein fully described and set forth.

65,195.—D. S. FISHER, Cedar Spring, Ind.—*Wheat Drill.*—May 28, 1867.—The seed slide is actuated by a rotating cam driven from the ground-wheel axle, and has above it a rotating agitator armed with radial pins.

Claim.—The rotating shaft B, provided with the pins *a*, in combination with the perforated board C, and the reciprocating slide D, operated by the cam H, all arranged substantially in the manner as and for the purpose set forth.

65,196.—D. S. FISHER, Cedar Spring, Ind.—*Harrow.*—May 28, 1867.—The radial arms of the horizontal rotating frames carry vertical teeth. These frames are rotated by a band from the ground wheel vertically adjustable by a series of circumferential grooves on the shaft and a pin traversing its journal socket and entering one of the grooves.

Claim.—First, the revolving harrows F F, secured to the lower ends of vertical shafts D D, which are fitted loosely in bars A A, or any suitable framing, substantially as and for the purpose set forth.

Second, the circumferential grooves *c* in the upper parts of the harrow shafts D D, in combination with the pins *d*, all arranged substantially as and for the purpose specified.

65,197.—D. S. FISHER, Cedar Spring, Ind.—*Corn Planter.*—May 28, 1867.—The seed is agitated by the radial pins of a rotating bar, and falling through an adjustable opening is carried to the spout by a reciprocating seed slide worked by a cam projection and a spring. The seed is covered by an automatically oscillating hoe.

Claim.—First, the rotating shaft D, provided with pins *a*, and the slide E, in combination with the reciprocating slide F, spring H, and the wheel I, provided with one or more projections *f*, all arranged to operate in the manner substantially as and for the purpose set forth.

Second, the hoe N, attached to the shaft L, in combination with the spring O, and the wheel I, provided with one or more projections *r*, and the arm *g*, on one end of shaft L, all arranged to operate in the manner substantially as and for the purpose set forth.

65,198.—D. S. FISHER, Cedar Spring, Ind.—*Plow.*—May 28, 1867.—The plows and rotary coulters are attached to sliding standards adjustable vertically by levers.

Claim.—First, the rising and falling or adjustable plow bars E F, one or more arranged with a lever or levers C D, and having rotary coulters J attached, all arranged substantially as and for the purpose set forth.

Second, the spring catches J*, one or more, arranged with the bars E F and levers C D, substantially as and for the purpose specified.

Third, providing the coulters J* with radial ribs *a*, substantially as and for the purpose set forth.

65,199.—D. S. FISHER, Cedar Spring, Ind.—*Propelling Wheeled Carriage.*—May 28, 1867.—The carriage is driven by a coiled spring and is connected by gearing to the rear axle guided by a semicircular rack on its fore axle.

Claim.—First, the frame A, with small frame D, shaft *a*, spring E, cogs *d t*, and axle B', with cog-wheel *b*, all constructed, arranged and operating in the manner substantially as and for the purposes specified.

Second, the segment F, shaft G, ratchet I, lever H, and bar R, all constructed and arranged for guiding the vehicle in the manner as set forth.

65,200.—HENRY FLAD and GEORGE P. HERTHEL, Jr., St. Louis, Mo.—*Hydraulic Elevator.*—May 28,

1867.—The hoisting rope is operated through the medium of sheaves by a hydraulic ram.

Claim.—First, the combination of the cylinder R, pistou *b*, sheaves *b' b'*, and system of pulleys, as arranged in relation to the reservoir C, or supply-pipe D and its connecting pipe *d*, substantially as shown and described.

Second, the arrangement with the foregoing of the secondary reservoir C', substantially as and for the purposes shown and described.

65,201.—CHESTER D. FLYNT, Collinsville, Ill.—*Carriage Seat.*—May 28, 1867.—The steel strips are interwoven, present a convex upper surface, and rest upon an elastic bearing in a rigid frame.

Claim.—The spring cushion C, in combination with the frame A, and the bands B, substantially as described.

65,202.—F. G. FOWLER, Springfield, Ill.—*Propeller.*—May 28, 1867.—The propeller wheel rotates in a horizontal plane and its vertical blades are pivoted to the ends of the horizontal radial arms. The tiller wheel operates an eccentric to whose surrounding strap the adjusting rods are attached; the other ends of the rods are pivoted to the back parts of the blades to adjust them. When the wide side of the eccentric is to the rear the blades act to propel, and turning the eccentric serves to steer the vessel.

Claim.—First, the eccentric *e*, in combination with the blades *a'*, hung on pivots placed on their vertical central line, and revolving, in the manner and for the purpose substantially as described.

Second, the chain wheels *i'*, and chain *r'*, or their equivalents, in combination with the eccentric *e*, and blades *a'*, arranged in the manner and for the purposes substantially as shown.

65,203.—ABEL M. FRENCH, Burton, Ohio.—*Medical Compound for Treating Ringbone, Spavin, &c., in Horses.*—May 28, 1867.—For cure of ringbone, spavin, &c. Quicksilver, 8 oz.; tincture of cantharides, 1½ oz.; nitric acid, 4 oz.; sulphuric acid, 4 oz. The acids must be added slowly to prevent accident.

Claim.—The herein-described compound, formed of the ingredients named, and applied substantially as and for the purpose specified.

65,204.—A. D. FRYE, JR., New York, N. Y.—*Bouquet Holder.*—May 28, 1867.—The bouquet is arranged around the central tube which may hold a handkerchief, and furnishes a socket for reception of the scroll which forms a foot for the bouquet holder.

Claim.—The tube A, formed in one or more parts, in combination with the reversible scroll B, either removably or securely attached for the purpose of holding bouquets or handkerchiefs, substantially as herein shown and described.

65,205.—ALFRED FRYER, Manchester, England.—*Apparatus for Evaporating and Concentrating Cane Juice and Other Liquids.*—May 28, 1867.—The evaporating trays connect with a rotating cylinder at a slightly lower level, and air, heated by the caloric current from the furnace, is forced through the cylinder. The trays may be connected by U-shaped side channels.

Claim.—First, treating cane juice and saccharine solutions and liquids in order to obtain what I term "Fryer's concrete," or sugar in a non-crystalline or semi-crystalline state, by exposing it or them to heat in shallow trays, and then to heat in a revolving cylinder, substantially in the manner herein set forth.

Second, treating solutions and liquids for evaporating and concentrating purposes, by exposing them to heat in shallow trays, and then to heat in a revolving cylinder, as herein set forth.

Third, treating cane juice and saccharine and other solutions and liquids for evaporating and concentrating purposes, by passing it or them through or into a revolving cylinder, heated from the inside, and through the inside of which heated air is forced or driven.

Fourth, the machinery or apparatus for the concentration of cane juice and saccharine and other solutions and for the evaporation of liquids, consisting of shallow trays in combination with revolving cylinders, all constructed and acting substantially in the manner described.

65,206.—STEPHEN F. GATES, Boston, Mass.—*Umbrella.*—May 28, 1867.—Improvement on the patent of A. G. Davis, August 31, 1858.—The tubular part of the handle to which the coupling is screwed has longitudinal internal grooves containing pressure springs projecting from the sliding rod, which prevent rotation and the consequent loosening of the coupling.

Claim.—In combination with the tubular handle, sliding rod, and feather or spring top, the groove or grooves in the tubular handle, operating as and for the purpose substantially as set forth.

65,207.—AUGUSTE LEON GENNERAT, Paris, France.—*Burglar Alarm Clock.*—May 28, 1867.—The movement of the handle raises a lever which on its recoil strikes the bell within the lock.

Claim.—First, the construction and arrangement of the piece A secured to the piece B of the handle lock, working in the hollowing of the partition of the stop piece D, to which the hammer G is secured, having trunnions D D', piece C upon the trunnion D', working from K to H thereon, spring P, stop pin M, and bell, as herein set forth, for the purpose specified.

Second, in combination with the above, the adjustable swivel T, whereby the ringing of the bell is prevented, as herein set forth, for the purpose specified.

65,208.—FAYETTE S. GILES, New York, N. Y.—*Stem-winding Watch.*—May 28, 1867.—The stem has a rectangular portion carrying a contrate wheel, which by depression of a thumb pin is made to engage a wheel to set the hands. This contrate wheel when not depressed engages by a ratchet clutch with a similar wheel geared with a toothed ring actuating the main spring gear wheel.

Claim.—The toothed ring C, in combination with the spur wheel A, the spring barrel and the contrate wheel c, attached to the winding stem or arbor, substantially as and for the purpose herein set forth.

65,209.—E. C. GORDON, Sevastopol, Ind.—*Fence.*—May 28, 1867.—The panels stand in zigzag form and are attached by wires to an anchor piece beneath the surface.

Claim.—Supporting and connecting the sections A A, as constructed, by means of the anchor B, in the manner herein specified and for the purposes set forth.

65,210.—GIDEON S. GRANGER and WILLIAM NORTROP, Wayland, N. Y.—*Gate.*—May 28, 1867.—The gate is in two sections, each supported by its bars on the adjoining fence and on hook pins of the central post; the latter is hinged at the ground and may be folded down to allow passage to vehicles.

Claim.—Hinging the central post G at or just above the surface of the ground, substantially as herein shown and described and for the purpose set forth.

65,211.—SYLVESTER GREENE, Rome, N. Y.—*Separating Cheese Curd from Whey.*—May 28, 1867.—The perforated plate fits the vertical sides of the vat and has pendent cutters which divide the curd; the whey is expressed by the weight of the plate.

Claim.—In the manufacture of cheese the separating of the whey from the curd by means of a gradual pressure produced by a perforated plate, and either with or without a strainer, substantially as herein shown and described.

65,212.—J. V. GREIF, Paducah, Ky.—*Plow and Cotton Scraper.*—May 28, 1867.—Explained by the claim.

Claim.—The spur or projection e formed upon the share C and fitting into the slot or hole f of the mold board, in combination with the bolt g, substantially as and for the purpose specified.

65,213.—R. H. GRIFFITH, Baltimore, Md.—*Boat Detaching Tackle.*—May 28, 1867.—Dogs prevent the block hooks from turning to release the bolt, and are connected by a longitudinal rod to insure coincidence of motion. One of the dogs has an arm which is engaged by a pin in the block. The removal of the pin releases the hooks.

Claim.—The rock shaft or rod A on which the cams e e are secured, when connected with the two pulley

blocks C C, one at each end of the boat, in combination with the pivoted hooks f f, constructed and operating substantially as and for the purposes set forth.

65,214.—NEWELL F. GUFFIN, Governor's Corners, N. Y.—*Hop Trellis.*—May 28, 1867.—Each pole rests in an eye on one post, and passes through the upper loop of the adjoining post.

Claim.—The combination of the poles A planted in double parallel rows, and the transverse inclined poles D interlocking the former, to which they are attached by hoops or loops C, and eyes B, substantially as and for the purpose set forth.

65,215.—JOHN HALLAS, New York, N. Y.—*Apparatus for Tempering Steel Wire.*—May 28, 1867.—The object is to save space and to bring both the discharging and receiving drums under care of one operator. The wire passes through the melted metal, and then, after passing through the oil tank, turns around a roller and returns through the tempering tank.

Claim.—First, in an apparatus for hardening and tempering wire, substantially of the character described, causing the wire, after it has passed through the heating pot in the furnace, or through the latter and oil or other bath, to be run or returned in its passage through the tempering pot, for after-collection or take-up, to the same side of the furnace from which the green wire was fed, substantially as specified.

Second, the arrangement on or in connection with the same furnace in which is located the first or heating pot B of the tempering pot F, having its temperature controlled by dampers, essentially as and for the purpose or purposes herein set forth.

65,216.—S. B. HARTMAN, Millersville, Pa.—*Safety Bridle.*—May 28, 1867.—Improvement on his patent of November 7, 1865. The rein has an elastic section connecting to the bit ring, and a leather connection passing through the bit ring over a roller on the check piece, and down for attachment to the bit ring.

Claim.—The employment or use of friction rollers b applied to the check straps C of the bridle in combination with the bit D, head strap E, and reins d, all arranged substantially as and for the purpose set forth.

Also, the elastic reins e in combination with the reins d, check straps C, and bit D, all arranged and applied to the bridle, substantially as and for the purpose specified.

65,217.—HENRY HASSENPLUG, Huntington, Pa., assignor to himself and EDWARD HASSENPLUG.—*Sawing Machine.*—May 28, 1867.—The log is clamped on a sliding frame, fed to the saw by a weight, draw cord, and a pawl. The saw is actuated by a crank, gear wheels, and adjustable levers.

Claim.—The feed device, consisting of the weighted cord l arranged in relation with the pawl p and ratchet bar q, all made as described, and operating so that the carriage shall be moved towards the saw, as herein set forth, for the purpose specified.

65,218.—B. G. H. HATHAWAY, Rock Stream, N. Y.—*Harvester.*—May 28, 1867.—The wheels turn backward on the axles freely, but when progressing rotate the axle which may be clutched to the cutter mechanism. This mechanism is contained in a spherical case from which the cutter driving shaft issues. The cutter is hinged to arms attached to different parts of the frame so as to form mutual braces.

Claim.—1. The spherical case when attached to the axle and constructed in two parts C and C', and having a projecting cylindrical pipe C'', which form bearing at P' and P'' for the attachment of the cutting apparatus, substantially as set forth.

2. The combination of the lever H, yoke H', clutch H², radial arms with depression D¹, and the planet wheels E, when constructed and arranged substantially as set forth.

3. The braces N and N' and N'', in combination with the tongue O, bracket P, and pipe C'', when constructed and arranged substantially as set forth.

4. So arranging the braces uniting the cutter bar with the supporting frame of the machine as that they may oscillate upon and around the pipe C'', substantially as set forth.

5. The combination of the lever Q', arm Q, bracket P, and pipe C'', substantially as set forth.

65,219.—B. G. H. HATHAWAY and GEORGE M. HATHAWAY, Rock Stream, N. Y.—*Harvester*.—May 28, 1867.—The ground wheel rotates freely on the fixed axle and carries within the three planet wheels which receive motion from a gear on a hemispherical case attached to the axle. These planet wheels engage a central cog wheel whose shaft acts by a pawl to revolve the bevel wheel, which in turn actuates the cutter driving shaft. The cutter is vertically adjustable by means of a lever.

Claim.—First, the ground wheel C in combination with the planet wheels D pivoted to its inner face, and a fixed gearing H' communicating motion to a pinion E, so arranged in combination with a detent that it can revolve only with the forward motion of the ground wheel, substantially as described.

Second, the combination with the planet wheel D, pinion E, detent E', and ratchet wheel F, when said parts are respectively constructed and arranged substantially as set forth.

Third, the hemispherical case H, when constructed with internal gearing H', and having a collar by which it is attached to a rigid axle, so as to dispense with a frame, substantially as set forth.

Fourth, the combination with the ratchet wheel F, bevel wheel G and collar I, with its pins I', yoke I'', rod I''', and lever I''', substantially as and for the purpose set forth.

Fifth, the arrangement of case H, axle B, tongue A, brace T, shoe M, and frame O, substantially as set forth.

Sixth, the combination of the wheel R, arm Q, frame O, and lever P, said parts being respectively constructed and arranged as and for the purpose set forth.

65,220.—ALBERT HETH and GAYLON HALL, Adams, N. Y.—*Clutch*.—May 28, 1867.—The frame carries a hook and has a fixed and movable clamping point for attachment to a beam.

Claim.—A clutch for suspending hay forks and other articles, said clutch consisting of a frame A provided with adjustable sliding brace i and revolving pointed pins f and h, and with a swivel hook e, all made and operating substantially as herein shown and described.

65,221.—CHARLES HINDLE, Brooklyn, N. Y.—*Governor*.—May 28, 1867; antedated May 16, 1867.—The tension spring regulates the action of the governor, and is adjusted by a thumb screw, which acts on the lower abutment collar of the said spring.

Claim.—The tension spring j and regulating screw l, in combination with the governor B and valve c in the pump barrel A, arranged substantially as and for the purpose set forth.

65,222.—JACOB HOERT, New York, N. Y.—*Bedstead*.—May 28, 1867.—The two end sections are jointed to the middle section, so as to fold together above it, inclosing the bed between them.

Claim.—The arrangement and combination of the toggle braces H D, legs E, and frame B, with the flexible bottom A, constructed and operating substantially as and for the purpose described.

65,223.—ROBERT HOSKIN, Brooklyn, N. Y.—*Roller for Floor Cloths*.—May 28, 1867.—The flanged ends of the rollers are radially grooved to receive the longitudinal bars by which the coils of cloth are kept separate.

Claim.—A roller, which is constructed substantially as described, for receiving cloth upon it for drying, so that the surfaces of the cloth are kept separate.

65,224.—ADOLPHUS HOWARD, Wellsville, Md., and GEORGE F. HOWARD, Chicago, Ill.—*Machine for Washing Leather*.—May 28, 1867.—The two brushes are rotated in opposite directions to draw the leather downward, and are supplied with water to clean the same.

Claim.—First, two or more revolving brushes, or their equivalents, for washing or removing the sediment from leather, for the purposes and substantially as herein described.

Second, in combination with the brushes E E, the tanks B B, or equivalents, for the purposes and substantially as herein set forth.

65,225.—CHARLES HOWLETT, New York, N. Y., assignor to himself and WILLIAM FREEBORN.—*Cartridge Box*.—May 28, 1867.—The cartridge box has a series of vertical plates whose incurved edges grasp the flanges of the metallic cartridges.

Claim.—A cartridge holder, formed of a series of strips or plates of suitable material, with raised edges or grooves to clasp the base of a cartridge, when arranged in combination with a cartridge box, substantially as and for the purpose set forth.

65,226.—GEORGE S. HUDSON, Ellisburgh, N. Y.—*Molding Machine*.—May 28, 1867.—The cutter shaft is carried on a sliding frame which is reciprocated by a walking beam, actuated by a crank and connecting rod. The reciprocation of the cutter causes the waves in the molding.

Claim.—The combination of the cutter shaft D, the reciprocating frame E and the walking beam G, or the equivalents of them, or either of them, the said combination being so arranged, substantially as described, that by its mode of operation the cutter shaft D and the cutter head z shall rise and fall while in motion to cut any required depth or curve in wave or serpentine wood moldings.

65,227.—JOHN HUGHES, Brooklyn, N. Y., assignor to himself and JAMES R. HITCHCOCK, New York, N. Y.—*Apparatus for Concentrating Sulphuric Acid and Other Liquids*.—May 28, 1867.—The pans are set in a sand bath and in an upwardly-ascending series from the hottest part of the furnace. A pipe conducts the sulphurous gases to the condenser.

Claim.—First, the flat pans E or H, arranged in a furnace, substantially as herein shown and described. Second, the furnace A, provided with a longitudinal chamber B, and with the transverse plates D or I, substantially for the purposes and in the manner herein shown and described.

Third, the manner herein shown and described of transferring the acid from one pan to another, either by spouts e and an inclined chamber B, or by means of syphons K K, substantially as herein shown and described.

Fourth, an apparatus for concentrating sulphuric acid, made and operating substantially as herein shown and described.

65,228.—R. H. HUSTON, Keokuk, Iowa.—*Car Coupling*.—May 28, 1867.—The catch ends of the coupling bar take over a catch in the draw head, and are held down thereon by a curved plate backed by a spiral spring. The bar is self-releasing on the throwing of a car from the track.

Claim.—First, a draw head with a chamber B for receiving a catch head G, of the form described, said chamber having its side walls made flaring so as to cause the escape of the catch head should a car leave the track, substantially as described.

Second, a yielding guide plate C, or its equivalent, in conjunction with a chamber B, of the form substantially as described.

Third, the combination of the draw head, which has a laterally-flaring chamber B, and the coupling bar G, with semi-ellipsoidal catch heads on its ends, substantially as and for the purposes described.

65,229.—JOHN H. IRWIN, Chicago, Ill.—*Lantern*.—May 28, 1867.—The inner chimney is carried through the horizontal plate in the cap, the heated air descending through holes in the same; outer air passing through the sides of the cap descending between said chimney and the glass globe to feed the flame. The chimney and globe are supported apart from the lamp and may be removed through the hinged top.

Claim.—First, extending the top of the inner globe F above the holes d in the lantern top, substantially in the manner and for the purposes specified.

Second, supporting the said inner globe in such a manner that the oil cup can be removed from the lantern without disturbing said globe, substantially as specified.

Third, so constructing a lantern that the interior globe can be removed from the lantern independently of the oil cup, substantially as described.

65,230.—JOHN H. IRWIN, Chicago, Ill.—*Lamp*.—May 28, 1867.—The bell mouth of the tube is over

the lamp and receives the heated air therefrom to conduct it beneath the lamp. An annular cooler surrounds the tube and assists in the descent of the air by increasing its specific gravity.

Claim.—First, in combination with the lamp or its burner the tube D, or its equivalent, arranged and operating substantially as and for the purposes specified.

Second, in combination with said tube B, a cooler E, arranged so as to operate substantially as described.

65,231.—JOSEPH H. JENNINGS, Cambridgeport, Mass.—*Rubber Boot for Horses.*—May 28, 1867.—The boot incloses the whole foot and the lower part of the leg, and is laced to the latter.

Claim.—For the curative treatment of the hoofs and lower parts of the legs of horses, a rubber boot, constructed and arranged substantially as specified.

65,232.—EZRAM JOHNSON, Joliet, Ill.—*Window Sash Fastener.*—May 28, 1867.—The cam is operated by a segmental rack wheel on its shaft, and a rack pin whose end projects from the stile.

Claim.—The toothed wheel F, in the recess b^2 , of the casing B, attached to the end of the shaft E, cam D and toothed bar G, when constructed, arranged, and operating as herein set forth for the purpose specified.

65,233.—STEPHEN C. KETCHUM, Winchendon, Mass.—*Mincing Knife.*—May 28, 1867.—The blades are pivoted to the shank so as to spread and make a draw cut as they press against the meat in the bowl; the springs return them to the former position as the knife is lifted.

Claim.—First, a double-bladed chopping knife, the blades being so pivoted to the shank as to give a drawing cut at each stroke, substantially as described.

Second, so hinging two or more blades or knives together, and supporting them in such a position with springs, as to allow the cutting edges to conform to any suitable concave, or the curves of a chopping tray or bowl, as herein described.

Third, the combination of the cutting blades B B, fulcrum pins d , shank A, springs C C, with the bolt and thumb nut D, operating in the manner herein described for the purpose set forth.

65,234.—S. P. KINGSLEY, Springfield, Wis.—*Churn.*—May 28, 1867.—The horizontally rotating dasher has beveled arms attached by radial wires to the cylindrical axle.

Claim.—First, the arrangement of the dasher having cylinder E, beveled arms i i , and wires S S or their equivalents, when constructed and used in the manner and for the purposes specified.

Second, the combination of the dasher as constructed with the churn box A, when operating in the manner as set forth.

65,235.—MARGARET KNOTTS, Carondelet, Mo.—*Medical Compound.*—May 28, 1867.—For the cure of piles. A decoction of persimmon bark, $\frac{1}{2}$ lb.; winter fern, $\frac{1}{2}$ lb.; to which add lard, 1 lb.; mutton suet, $\frac{1}{2}$ lb., and rosin, $\frac{1}{2}$ oz.

Claim.—The medical compound, made substantially as and for the purpose described.

65,236.—HENRY C. KOCHENSPIERER, Thornville, Ohio.—*Holder and Seat for Wagon Brakes.*—May 28, 1867.—Iron sockets contain the rubber blocks, and rest by their flanges upon the ends of the brake bar.

Claim.—First, the holder A, constructed substantially as described, in combination with the brake bar or its equivalent, as set forth.

Second, the combination of the holder A, and rubber D, substantially as and for the purpose specified.

65,237.—E. M. KRUM, Nassau, N. Y.—*Horse Hay Fork.*—May 28, 1867.—The pivoted tines are clamped on the hay by straightening the toggle links. The latter are bent by pulling a trigger cord, and the hay opens the tines and is discharged.

Claim.—First, the construction as the curved tines A A, with angular portions $A' A'$, and with jointing portions a a , said tines being connected together by means of a pivot b , and toggle links c c d , the link d being constructed and operating in the manner shown, all substantially in the manner and for the purpose set forth.

Second, the arrangement of the cords B B B, and line g' , in combination with the pivoted tines A A', toggle links c c c , and lever link d , all in the manner and for the purpose described.

Third, the arrangement of the stop g on one of the toggle levers in combination with the lever link d , of the toggle c c d , substantially in the manner and for the purpose described.

65,238.—JOHN LAING, Hoboken, N. J., assignor to self and GEORGE NIMMO.—*Faucet.*—May 28, 1867.

—The spindle of the disk valve passes through a sleeve which traverses the receiving chamber, and the perforated disk has a seat upon a correspondingly perforated plate.

Claim.—A faucet formed with a pipe extending from the seat i' of the disk valve n , across the water way g , and receiving the spindle i of said valve, as and for the purposes set forth.

65,239.—HENRY SAMPSON, London, England.—*Bale Tie.*—May 28, 1867.—Explained by the claim and illustration.

Claim.—Securing the ends of the band a together by passing the end a' through the metal loop b and turning the same back upon the inside of the said band, the opposite end a^2 passing through the loop b' and through the loop b , and turned back short over the outside of the loop b , and inserted again in the loop b' , and the latter slipped up toward the loop b , when all are arranged and operating substantially as herein shown and described.

65,240.—R. LAPHAM and G. CLARK, Jr., Boston, Mass.—*Chemical Fire Engine.*—May 28, 1867.—In each of the two compartments of the engine is a force pump communicating with a receiver. The compartments are charged respectively with a solution of carbonate of soda and dilute acid.

Claim.—First, the admixing of chemicals for producing carbonic acid gas, substantially as described and for the purpose set forth.

Second, the use of pumps when they are employed for forcing upon the fire chemical solutions which, when brought together, produce carbonic acid gas.

65,241.—CORNELIUS H. LATHAM, Randolph, N. Y.—*Tube Well.*—May 28, 1867.—The upper sections of stoneware form the pump barrel, and are coupled to a lower section of smaller diameter which has a pointed end and water induction slits, and is driven into the ground.

Claim.—The arrangement of the slotted tube A with point B shrunk upon it, when used in combination with the coupling E, as constructed with valve box seat and the pump sections D D, in the manner substantially as and for the purposes herein fully set forth.

65,242.—GEORGE LAUDER, Pittsburg, Pa.—*Machine for Straightening Bars.*—May 28, 1867.—The bar is compressed between two rolls which turn in the same direction, and whose axes are set obliquely to each other and to the axis of the bar which traverses slowly between them endwise, presenting all portions of its surface to the straightening action. The motion is obtained by a worm on the oblique axis which engages gearing on the ends of the respective rollers.

Claim.—The worm E and worm wheels B and C, arranged relatively to the skewed straightening rolls B C, and to the housing A, or its equivalent, substantially as and for the purpose herein set forth.

65,243.—JEWETT LAWRENCE, Ripon, Wis.—*Revolving Tablet for Multiplying Photographic Pictures.*—May 28, 1867.—The picture plate is placed in the tablet which is hung upon a pin of the standard. The slide being raised and the picture taken the tablet is partially revolved exposing another surface. The bar being unlocked the standard and tablet may be raised or lowered, presenting new surfaces for impressions.

Claim.—The revolving tablet G, the cross-bar C, and the standard E arranged in the camera, as and for the purpose specified.

65,244.—GEORGE LAWTON, Trenton, N. J., assignor to GEORGE JAMES, same place.—*Machine for*

Stamping Clay Door Knobs.—May 28, 1867.—The upper die falls three times with variable force. The holes are made for receiving the shanks; the branching holes, to enable the lead filling to adhere, are made by expanding spring pins in the shank hole former.

Claim.—First, the arrangement and construction of the cams D, whereby the dies *e* are operated three times in succession, the said cams consisting of the parts *h* *i* and *k*, all made and operating substantially as and for the purpose herein shown and described.

Second, the device for raising the pushers H, so as to lift the stamped articles out of the matrices *c*, the said devices consisting of the cams *o*, levers *n*, and rods *m*, all made and operating substantially as herein shown and described.

Third, the spring *s*, when arranged as herein shown and described for the purpose of depressing the pushers H, as set forth.

Fourth, the device for forming the small horizontal holes at the bottom of the shank holes in door knobs, said device consisting of the pins *p*, tubes H, springs *q*, and pins *r*, all made and operating substantially as herein shown and described.

65,245.—THOMAS LIPPIATT, New York, N. Y.—*Rose Engine Lathe.*—May 28, 1867.—The tool box carries the graving tool, whose movements are controlled by the movements of the pattern, and which is still free to be pressed against the article to be engraved.

Claim.—First, the swinging frame K suspended from the sliding stock *r* and furnished with the tracing pin *u*, in combination with the pattern E and sliding tool box I, substantially as herein set forth, for the purpose specified.

Second, the sliding frame C, main frame A, and adjustable frame D, combined and arranged in relation with each other and with the tool box I, swinging frame K, and pattern E, substantially as herein set forth, for the purpose specified.

65,246.—JAMES P. LOVE, New York, N. Y.—*Fastening for Corsets.*—May 28, 1867.—The flap of the corset is folded round the spring and retained by hooks. Pins project through openings in the flaps and are engaged by eyes on the other steel, which is similarly bound in its flap and secured by hooks.

Claim.—First, the manner herein shown and described of securing the steels *b* *b* in corsets by means of flaps *a* and *c*, and hooks *d*, and eyelets or button holes *e*, all made and operating substantially as and for the purposes herein shown and described.

Second, the fastenings *f* and *g*, in combination with the flaps *a* and *c* and steels *b*, hooks *d*, and eyelets or holes *e*, all made and operating substantially as herein shown and described.

65,247.—CHARLES B. LOVELAND, Elizabethport, N. J.—*Shoe Sole.*—May 28, 1867.—A toe clip on the metallic sole plate enables it to clasp the sole to which it is further secured by screws. The heel socket is also screwed to the heel and the plates afford attachment for half-sole and heel tap respectively.

Claim.—First, the movable metal plate B, with the continuous bent lip *c*, for clasping the sole *d*, and having the half-sole *b* attached thereto and fastened to the sole *a* by means of the screws and flanged nuts *m*, as and for the purpose herein described.

Second, the adjustable metal lift *e*, with front and rear set off with the tap *g*, employed and fastened to the heel of a shoe by means of the screws *d* *s*, fitting into the flanged nuts *n* *o*, as and for the purpose herein specified.

65,248.—WARREN LYON, New York, N. Y.—*Machine for Cutting Stubs.*—May 28, 1867.—One shear is attached to the standard and the other to the oscillating plate, which is rocked by segment rack and lever to sever the rod. The latter is thrust through the throat till it meets the adjustable gauge, which gives way to allow the discharge of the severed piece of the rod.

Claim.—The operating of the pivoted plate E through the medium of the segment rack F and pinion C, when said plate E has a cutting plate *c* attached, and is used in connection with a similar cutting plate *d* on a fixed standard or plate A, to which the plate E is pivoted, all arranged substantially as and for the purpose specified.

Also, the combination of devices composing the gauge, arranged substantially as and for the purpose set forth.

65,249.—JACOB MAUCK, Cheshire, Ohio.—*Portable Hay Press.*—May 28, 1867.—By the duplication of the pulleys and the ropes, which are wound upon different parts of the capstan, the chafing of the ropes is prevented. At the end of the press, where the strain is greatest, a series of binding stirrups are applied and the latter are tightened by nuts.

Claim.—A hay press having capstan A, ropes *a* and *b*, pulleys *c* and *d*, clevis I, pins 2 and 3, carriage C, stirrups F, hooks *g* *g*, and braces *f*, constructed, combined, and operating substantially as herein specified.

65,250.—GEORGE W. MCGHILL, Washington, D. C.—*Button.*—May 28, 1867.—The double metallic shank penetrates the cloth, making but a single hole, and its two members are then clinched upon the washer, which rests against the cloth.

Claim.—The double or split metal shank for a button herein described, in combination with a metal washer, constructed and applied substantially as described.

65,251.—R. M. McGRATH, Lafayette, Ind., assignor to himself and J. H. GALLAGHER.—*Sawing Machine.*—May 28, 1867.—The first-mentioned lever is held in position by a rack on the uprights, and has pins on its under side by which it is adapted to dog the log. The saw is elevated by the pulley and cord, and the friction wheel, which drives the feed shaft, is thrown by another lever into or out of gear with a similar wheel on the main shaft.

Claim.—The arrangement of the lever *y'*, pulley *z*, and its cord *x*, and the lever *v'*, for placing within the control of the operator the management of the sawing and feeding devices of the machine.

65,252.—ALEXANDER MCKENZIE, Newport, Ky., assignor to himself and WILLIAM C. DAVIS, same place.—*Paddle Wheel.*—May 28, 1867.—The blades descend obliquely into the water so that an equal amount of blade surface is submerged at all times and jar avoided. The position of the arms gives the blades such direction as to prevent them from lifting water.

Claim.—The arrangement of inclined blades or buckets G, radial arms B, oblique secondary arms C, and brace rings E, substantially as and for the purpose set forth.

65,253.—G. L. MCKNIGHT, Worcester, Mass.—*Calipers.*—May 28, 1867.—The position of the nut determines the extent to which the legs of the calipers may be expanded by the spring, and the wedge-like action of the screw within the slotted standard firmly binds the nut in its adjusted position.

Claim.—First, the combination with the slotted standard or screw B of the screw D, for holding the adjusting nut C, substantially as described.

Second, the combination with the upper part of the body or part A of the spring E, substantially as and for the purposes set forth.

65,254.—E. MEGGENHOFEN, Frankfort-on-the-Main, Germany, administratrix of the estate of EDWARD MEGGENHOFEN, deceased.—*Steam Safety Valve.*—May 28, 1867.—The levers and their connections with the spring balance are so proportioned and applied that the downward pressure exerted on the valve is not changed by the rising of the valve and increased tension of the spring. The spring balance thus acts as a weight.

Claim.—The arrangement of the bell-crank lever C, connecting rod D, with reference to the spring balance A, constructed substantially as and for the purpose set forth.

65,255.—F. MERTENS, Cumberland, Md.—*Bracing and Staying Boats.*—May 28, 1867.—The side trusses of the flat-bottomed boat are stayed by braces and hog-chains reaching from the gunwale deck or shear to the keelson.

Claim.—The arrangement of the braces E and F, and the cross-ties G, when constructed and combined with the tightening rods H, as herein described and for the purpose set forth.

65,256.—JOHN H. MESLER, Symm's Corner, Ohio.—*Compound for the Cure of Hog Cholera.*—May 28, 1867.—Chamber lye, 3 quarts; assafoetida, 12 oz.; tincture of camphor, 2 oz.; tincture of opium, 2 oz.; tincture of rhubarb, 2 oz.; whisky, 1½ pts.

Claim.—A compound for the prevention and cure of hog cholera, made of the ingredients set forth.

65,257.—WILLIAM F. MORTON, New Haven, Conn.—*Carriage Wheel.*—May 28, 1867.—The circumferential bands bind the hub. The spokes are inserted between the radial flanges.

Claim.—The double collar with its bars and flanges all cast in one piece, when the double collar is fitted to the hub and the flanges to support the spokes, substantially as herein described and set forth.

65,258.—WILLIAM MYLER, Bridgeport, Ohio, assignor to GEORGE W. JOHNSON, Wheeling, West Va.—*Roofing Material.*—May 28, 1867.—Coal tar, 12; pine tar, 1; soap stone, 12; ochre, 1; and hydraulic cement, 4 parts.

Claim.—The combination of coal tar, pine tar, soap stone, ochre, or other oxide, and hydraulic cement, substantially as specified.

65,259.—JOSEPH NATHAN, Washington, D. C.—*Bottle Stopper.*—May 28, 1867.—A yoke is anchored to blocks on a wire around the neck of the bottle. A boss on the crown of the stopper is tapped to receive the threaded portion of the presser-rod, whose lower end carries a disk loosely fitted between the rubber stopper and its metallic casing.

Claim.—First, the screw E, the lower part of its shank being made smooth, substantially as and for the purpose described.

Second, The blocks b, on the wire B, constructed and arranged substantially as described.

Third, the combination of the wire B, blocks c, yoke C, screw E, with the lower part of its shank made smooth, and stopper f g, substantially as and for the purpose described.

65,260.—JOSEPH NOCK, Washington, D. C.—*Trunk Lock.*—May 28, 1867.—A pin on the bolt-operating lever enters between the side catches of recesses in the tumblers which are raised by the wards of the key to a position to allow passage to the pin in unlocking. The hasp when free is thrown out by a spring surrounding and attached by one end to the pintle, which has a flattened part engaged by blocks to prevent rotation.

Claim.—First, the use of the crooked lever E, or its equivalent, in combination with the tumblers F, more or less in number, and the bolt D, arranged substantially as described and shown.

Second, the spindle m, with the spring n, when inserted and confined in the hasp, substantially as described and for the purposes set forth.

65,261.—JOSEPH NOCK, Washington, D. C.—*Trunk Lock.*—May 28, 1867.—The double hooked spring tumblers are alternately thrown in opposite directions to disengage them from the catch-pin. These opposite motions are given by the direct action of some of the key wards upon the corresponding tumblers and of others upon levers which give a reverse motion to the corresponding tumblers.

Claim.—A series of spring tumblers E, and levers d, so arranged and combined that the key shall act directly upon a portion of said tumblers to release them from the staple and at the same time shall act on the levers d, causing them to act upon and release either of the tumblers, in the manner substantially as described.

65,262.—Prince NICOLAS OUBOUSSOFF, St. Petersburg, Russia.—*Portable Camp Bed.*—May 28, 1867.—The cork-dust filling is light and impervious to moisture. The sections are sewed together at their edges and may be rolled and bound up for transportation. The pocket receives a blanket or clothing to form a pillow, and the sheet, covering the seams, forms a smooth surface to lie upon.

Claim.—Making the bed in sections filled with cork dust, or its equivalent, and furnished with a pocket d, and flap sheet or covering e, all substantially as and for the purpose described.

65,263.—ISAAC PARDEE, Vineland, N. J., and R. C. PARVIN, Forest Grove, N. J., assignors to R. C. Parvin.—*Stump Extractor.*—May 28, 1867.—The rack bars pass through the socket above the frame and are engaged by pawls; the oscillating lever is pivoted to both and they alternately form fulcrums by which the chain is lifted.

Claim.—The pawls G G, resting upon the ledge a, of the socket E, with their lower inner corners rounded as shown at b, so that their upper ends will fall by their own gravity against the ratchet bars F, and engaged therewith, when constructed and arranged as herein shown and described.

65,264.—B. F. PARTRIDGE, jr., Columbus, Ky.—*Locomotive Pilot.*—May 28, 1867.—The rollers and serrated disks are to cut and remove obstructions with certainty.

Claim.—The horizontal revolving disks d d d, having their peripheries serrated, pivoted to the under side of the bottom plates, a a, in combination therewith and with the pilot frame A, and inclined rollers c, substantially as herein described for the purpose specified.

65,265.—CHARLES H. PERKINS and RICHARD W. COMSTOCK, Providence, R. I.—*Horseshoe Machine.*—May 28, 1867.—The previously bent shoe blank is clamped to the block and operated on by the revolving hammers pivoted to a rotating disk.

Claim.—The combination in a machine for making horse shoes of the following instrumentalities: A rotary hammer B, sliding anvil E, or equivalent apparatus for supporting the shoe blank and the gripping tongs L, arranged relatively to each other, and operating substantially as described for the purposes specified.

65,266.—FRANKLIN PERRIN, Cambridge, Mass.—*Preparation of Palm Leaf Warp and Wool for Weaving.*—May 28, 1867.—A ligature is tied around the folded leaf as imported, and the bent sides of the folds split to the ligature at both ends before it is split into the smaller strips.

Claim.—The employment of a ligature in the preparation of palm leaf strips, substantially as set forth.

65,267.—WILLIAM HUGH PIERSON, New Orleans, La.—*Plastic Compound made from Vegetable Fiber.*—May 28, 1867.—Vegetable fiber is treated with acid to render said substance soluble in other solvents than acids and capable of being molded into form.

Claim.—First, the formation of articles of manufacture, resembling stone, wood, whalebone, shell, horn, and other rigid or elastic articles, out of plastic or semi-soluble pyroxyline, prepared substantially in the manner and for the purposes herein set forth.

Second, the combination of plastic as above described with vegetable or any other foreign matter, substantially in the manner for the purpose set forth.

Third, making woven cloths and other fabrics, water or air proof, by treating them with plastic, substantially as and for the purposes set forth.

Fourth, the combination of plastic with drying oils for water-proofing, and transparencies, and other purposes.

Fifth, combining plastic with metals, and various metallic substances in the pulverulent state, substantially as described.

Sixth, attaching by means of plastic fur, plush, or other short fiber, to any suitable surface, so as to give a fur-like surface, substantially as set forth.

Seventh, forming a compound for painting and coloring, and other purposes, by admixture of plastic and solvents, with paints, oils, dye-stuffs, and other coloring matter.

65,268.—ROBERT POOLE, Baltimore, Md.—*Machine for Rubbing and Mixing Paints, Chemicals, &c.*—May 28, 1867.—The circular pan rotates by outside mechanism, and the stirring and scraping feet revolve therein, each one in an epicycloidal course upon the bottom of the same. When discharging a curved scraper is let down to bring the paint to a central opening, which is ordinarily covered by a valve.

Claim.—A pan or other suitable holding vessel, revolving around its support, and a series of rollers or mixers in said pan, revolving around their and a differ-

ent support, and in the same direction with the pan, substantially as described.

Also, in combination with a revolving pan and stirrers, a scraper which, when let down into the pan, will guide and direct the mixed or rubbed material to a central discharge opening in the bottom of the pan, substantially as described.

65,269.—S. L. PORTER, assignor to himself and W. F. EATON, same place.—*Raising and Leveling Railroad Rails.*—May 28, 1867.—The vertical slide plate moves on the bed plate, whose end is slipped under the rail; the crowbar rests on one of the graduated steps.

Claim.—The bed plate A and the slide plate B, combined with a graduated fulcrum for leveling railroad tracks, constructed and operating substantially as herein described.

65,270.—EDMOND QUERU, New York, N. Y.—*Box for Putting up Tooth Powder.*—May 28, 1867.—Veneers are cut into sections by V-shaped cutters, which give miter edges to the pieces by which they are glued together, forming rectangular frames, whose bottoms are glued on and whose tops are fastened by a strip of glued cloth, which forms a hinge.

Claim.—First, the toilet box, constructed of the material and in the manner substantially as herein set forth.

Second, securing the cutter thereon by the fibrous hinge J K and seal L M N, substantially as and for the purpose herein set forth.

65,271.—JOSEPH S. RANDALL, Grand Rapids, Mich.—*Horse Rake.*—May 28, 1867.—The rake-teeth have brace springs and are connected to a rack bar, operated by a jointed connecting rod and a hand lever. The clearer is moved downward automatically when the rake is raised.

Claim.—First, the independent sliding rake-teeth, furnished with springs and arranged upon a hinged bar G, and operated substantially in the manner and for the purpose described.

Second, the combination of the independent sliding rake-teeth, furnished with springs with the hinged bar G, substantially in the manner and for the purpose described.

Third, the combination of slotted bar F, hinged bar G, forked pieces g, and curved rake-teeth J with springs h, arranged upon a frame A, substantially as described.

Fourth, a vertically-adjustable vibrating fork, in combination with a vibrating hay rake, substantially as described.

Fifth, the arrangement of the springs h substantially in the manner and for the purpose described.

65,272.—J. WYATT REID, New York, N. Y.—*Sleeping Car.*—May 28, 1867.—The supporting chains are attached to hooks at one end and are drawn taut by a crank roller at the other. This roller is retained by ratchet and pawl.

Claim.—The bed D, suspended by chains a, horizontal shaft d, provided with ratchet and pawls, hooks i i and s s, when constructed and arranged within the sleeping car, substantially as herein set forth and for the purpose specified.

65,273.—BENJAMIN F. RICE, Boston, Mass.—*Portable Shelf.*—May 28, 1867.—The claws of the bracket are pivoted together, the ends of the lower being turned up for the attachment of the shelf, and that of the other turned down for a brace.

Claim.—The pivoted or jointed parts i d and g k, in combination with a portable shelf or receptacle, as a new article of manufacture.

65,274.—JOHN RICHARDS, Cincinnati, Ohio.—*Hanger for Shafting.*—May 28, 1867.—The box is supported on a bracket vertically adjustable by set screws.

Claim.—A hanger for shafting constructed with the pivoted box support Y and its means of adjustment, operating substantially in the manner and for the purpose herein set forth.

65,275.—JOHN E. RICHARDSON, New York, N. Y.—*Chilling Oils and Fats.*—May 28, 1867.—Instead

of surrounding the tank containing the lard with ice, the two are placed in the tank together and the whole covered with ice shavings.

Claim.—The method of chilling oil substantially as herein set forth, so that the ice is brought in direct contact with the lard in the manner specified.

65,276.—JOHN W. RICKER, Chelsea, Mass.—*Tube Well.*—May 28, 1867.—The lower section of the driven well-tube, which is perforated for the passage of water, is surrounded by a sleeve of wire cloth and an outer coil, which, by partially unscrewing the coupling, causes the joints to open to clear the strainer spaces.

Claim.—In combination with the induction well-tube a coiled spring, arranged to operate substantially as and for the purpose set forth.

Also, in combination with a well tube the concave surfaces and triangular pointed drill, substantially as set forth.

65,277.—J. P. W. RILEY, Montrose, Pa.—*Securing the Tines of Forks and Rakes to their Handles.*—May 28, 1867.—The parts of the tines which enter the socket have counterpart notches and projections by which and the upper wedges they are clamped.

Claim.—First, making the tines of a hay fork in two parts, which are scarfed in a mortise in the handle or ferrule and secured in position by means of keys or wedges, substantially as herein shown and described.

Second, in combination with the double tines C C the double tines D D, which, when inserted in the handle in the manner specified, will convert the device into a manure fork, and can be removed whenever desired, substantially as herein shown and described.

65,278.—BENJAMIN F. ROBERTSON, Cap an Gris, Mo.—*Corn Planter.*—May 28, 1867.—Explained by the claim and illustration.

Claim.—The employment of the partition D for the purpose of dividing and scattering the seed, substantially as described and set forth.

65,279.—OLIVER R. ROGERS, Roxbury, Mass., assignor to self and D. S. BARTLETT, same place.—*Fruit Picker.*—May 28, 1867.—The receiver has an inclined staff socket, and its top is partially covered by a toothed plate, which disengages the fruit.

Claim.—A device for picking fruit, constructed in the manner substantially as herein shown and described.

65,280.—ROBERT E. ROGERS and JAMES BLACK, Philadelphia, Pa.—*Steam Generator.*—May 28, 1867.—The boiler is suspended in the furnace, and its enlarged part connected to its lower end by out-bowed pipes.

Claim.—First, the beveled enlargement a of the boiler, in combination with the curved or bowed tubes B for the circulation of the water, said tubes being attached at their upper ends to said enlargement a, and at their lower ends directly to the body of the boiler in the manner and for the purpose substantially as shown and described.

Second, the construction of the tubes B with a continuous curve from one connection to the other of boiler, substantially as herein set forth.

Third, the screw nuts, in combination with the outside circulating tubes and the shell of the boiler, one at each end, substantially as herein set forth.

65,281.—ROBERT E. ROGERS and JAMES BLACK, Philadelphia, Pa.—*Steam Generator.*—May 28, 1867.—Similar to foregoing, but having vertical traversing flue tubes.

Claim.—The combination of the boiler A, having the beveled enlargement a, with the exterior curved tubes B, for the circulation of the water, and the flue tubes C, in the manner and for the purposes substantially as described.

65,282.—ROBERT ROOKE, Empire City, Oregon.—*Washing Machine.*—May 28, 1867.—A series of pounders operate in the rotating tub, which has a perforated false bottom.

Claim.—The pounders A, in combination with a rotary tub C, placed within a fixed tub A, and all arranged to operate substantially in the manner as and for the purpose herein set forth.

65,283.—W. S. SALISBURY, Adams Centre, N. Y.—*Device for Suspending Hay Forks.*—May 28, 1867.—The points at the end of the jointed clevis arms penetrate the beam, and the ratchet and a spring prevents their opening to disengage the grasp.

Claim.—The two arms A, pivoted together at one end and provided with points E at the other, in combination with the ratchet and spring pawl, substantially as and for the purpose described.

65,284.—J. W. SANDERS, Ripon, Wis.—*Fence.*—May 28, 1867.—The boards of the panels are joined by vertical slats which overlap on each side of one end to form a groove for the end of the next panel. They set on blocks and are stayed by inclined notched studs.

Claim.—The portable sections A, as constructed, when used in combination with the stays *g g*, blocks *f*, and studs, in the manner and for the purposes specified.

65,285.—HUGH SANGSTER, Buffalo, N. Y., assignor to HORACE PARMALEE and WILLIAM H. BONNELL, same place.—*Lantern.*—May 28, 1867.—The spring plates have catches which enter the apertures of the lower ring of the frame and firmly attach the lamp thereto.

Claim.—First, the combination of the springs I I, catches J J, and rim G, with the apertures K, as and for the purposes herein substantially set forth and described.

Second, the springs, when constructed of the parts P P, as shown in figure 5, and put together as described.

65,286.—EJLERT O. SCHARTAN, Philadelphia, Pa.—*Heating Attachment for Oil Lamps.*—May 28, 1867.—The coffee pot has a central flue and sets over the bulb of the lamp chimney beneath. The upper part of the chimney being attached, a heating chamber may be substituted for the boiler.

Claim.—The chamber P, with the kettle J, with the lower half of the jointed glass chimney, when arranged, used, and combined as herein described and for the purposes set forth.

65,287.—JEHYLEMAN SHAW, Bridgeport, Conn.—*Life Preserver.*—May 28, 1867.—The water and food receptacle of the life-preserving float has passages above the water through which the food can be withdrawn.

Claim.—The life preserver, constructed as described, consisting of the water and food receptacles D E, attached to the portion A, the water receptacle D, provided with the air tube G, and drinking tube F, the food receptacle provided with the opening H, closed with the plug I, and the elastic bag J, substantially as described for the purpose specified.

65,288.—JOSEPH H. SHAW, Saco, Maine.—*Pill Machine.*—May 28, 1867.—The upper and lower segments have counterpart grooves, and are reciprocated on each other to bring the pills to a spherical form. The track being curved, causes them constantly to change their axes of revolution and rolls them on all sides.

Claim.—The combination of the two curvilinear grooved plates *a a'*, united and operated by the two radial arms *c d*, the plate *a* moving upon the stationary plate *a'*, and having for its axis the bolt *f*, all as and for the purposes specified.

65,289.—JOSEPH SHERMAN, Burlington, N. J.—*Grate Bar.*—May 28, 1867.—The bar is tubular and has small side and top openings for issue of air. The air is admitted through a hole in the rear end of the bar.

Claim.—First, the horizontal tubular grate bars A, open at B, and constructed with small orifices *a a'*, for the escape of the air on the three sides nearest the fire, and also with an opening C at or near the rear end, substantially as and for the purpose set forth.

Second, ventilated grate bars, constructed with a vertical tubular and perforated extension D, of the horizontal tubular portion of the bars A, substantially as described.

65,290.—WALTER SHRIVER, New York, N. Y.—*Reservoir Damping Brush.*—May 28, 1867.—The reservoir within the handle contains water which passes to the brush. An opening covered by a screw cap admits water, and a thumb valve closed by a spring admits air to regulate the flow of water.

Claim.—As a new article of manufacture, a reservoir damping brush for wetting paper for copying letters, arranged and constructed substantially as and for the purpose described.

65,291.—JOSEPH SMITH, Loth, Belgium.—*Cap for Spinning Machines.*—May 28, 1867.—An adjustable ring is attached to the base of the ordinary cap, beneath which the thread passes in its course from the delivery rollers to the spindle within the cap.

Claim.—The adjustable ring B, in combination with the cap A, and spool or bobbin C, constructed and operating substantially as and for the purpose specified.

65,292.—A. STEERS, New York, N. Y., assignor to THE AMERICAN TANNING COMPANY, same place.—*Apparatus for Tanning.*—May 28, 1867.—The hides are distended upon a cloth within a wired frame, and being suspended from a beam are subjected to the action of followers within the vat, by which they are alternately squeezed and released, to cause the circulation of the liquor and the absorption of the tannin by the hides.

Claim.—First, expressing the exhausted tanning liquor from hides or skins, substantially as herein shown and described, without the use of rollers.

Second, the metallic frame or frames D, with their wire and cloth for keeping the hides or skins distended while being tanned, substantially as herein shown and described.

Third, placing the hides or skins between two cloths, during the process of tanning, substantially as herein shown and described and for the purpose set forth.

Fourth, having the hides or skins attached to the frames D, suspended in the vat by the ropes *f*, and springs *n*, substantially as herein shown and described and for the purpose set forth.

Fifth, the combination of the rammers B with the vat A, substantially as herein shown and described, so as to produce a reciprocating action upon the skins or hides.

Sixth, the use of press platens, immersed in fluid, buoyantly adjusted and operating without friction, substantially as herein shown and described.

Seventh, the combination of spring platens or plates *l*, rammers B, vat A, and frames D, or their substantial equivalents, with each other, substantially as herein shown and described, and for the purpose set forth.

65,293.—JOHN STEPHEN, Womelsdorf, Pa.—*Shaft Coupling.*—May 28, 1867.—The cross-bar on the end of the thill iron is a segment of a cylinder, and while the thill is held vertically is entered in the slot on the upper side of the barrel of the shackle; being then oscillated to the working position it is retained, and the bands around the cross-bar fit in the barrel and prevent rattling.

Claim.—The bar B, provided with grooves, and the rubber *c c*, when used in combination with the barrel D, and when constructed in the manner substantially as and for the purposes specified.

65,294.—EDGAR M. STEVENS, Boston, Mass., assignor to WM. N. ELY, Stratford, Conn.—*Pegging Machine.*—May 28, 1867.—The work is fed by a movement of the awl, and the head so hung as to conform to the surface curvatures of the sole. The awl descends through the peg tube into the work, is moved forward by a cam, raised by another cam and back again by the former cam. The pin withdraws the knife, the peg wood is forced into the tube, the knife splits off a peg. The driver descends and drives the peg into the tube.

Claim.—First, the combination of a vibrating moving awl, with a sliding or vertically moving head, substantially as described.

Second, combination of the feeding awl with the sliding and swinging head, substantially as set forth.

65,295.—FRANCIS A. STEVENS, Chicago, Ill.—*Steam Generator.*—May 28, 1867; antedated May 22, 1867.—Jets of steam are thrown into the sides of the ash pan, and the engine exhausts into an inverted conical receiver, having lower upwardly directed openings through which jets of steam are thrown into the annular smoke space of the stack.

Claim.—First, the ash pan C, having the short tubes c in the sides arranged as herein specified, relatively to the permanently fixed pipes D and nozzles d, discharging steam from the boiler into the tubes c, as specified, and allowing the ash pan to be connected and disconnected without disturbing the steam connection.

Second, the steam jets d, blowing into the ash pan of the locomotive, arranged with reference to the exhaust reservoir H and the ring of jets J for facilitating the exit of the gases, substantially as and for the purpose herein specified.

Third, the exhaust reservoir H, made to correspond in form with and mounted in the interior of the smoke stack I, so as to discharge the steam from the ring of jets J, and urge upward the gases in the space between the two conical casings in the stack, in the manner and for the purpose substantially as herein specified.

65,296.—LEVI STEVENS, Fitchburg, Mass., assignor to NORMAN C. MUNSON, Shirley, Mass.—*Apparatus for Carbureting Air.*—May 28, 1867.—The air is drawn into and through the vaporizer by an air pump. The meter works in hydro-carbon liquid so as to increase the vaporization.

Claim.—The combination of an air-exhausting apparatus with the vaporizer, separate or distinct, in such manner that air may be drawn through the vaporizer, and with the hydro-carbon vapors thereof be drawn out of such vaporizer and into such exhausting apparatus, the whole being substantially as described.

Also, the arrangement and connection of the air-pumping apparatus and the vaporizer, separate or distinct, in such manner that the hydro-carbon fluid may pass freely from one into the other of them, so as to stand at one level in both, and so that the wheel of the pumping apparatus while in rotation may revolve in such liquid as specified.

Also, the combination of the fluid elevator and its operative mechanism, or their equivalents, with the tank E, the vaporizer, and the air-pumping apparatus.

Also, the combination of the wire-gauge disseminator k l with the perforated distributor i and the series of inclined plates or evaporating surfaces arranged beneath the same as specified.

Also, the combination of one or more plates m n o and clothes p p p, arranged together in the vaporizer, in manner and so as to operate as set forth.

Also, the combination of the tortuous passage G at the lower part of the vaporizer, with the series of perforated plates m n o, covered with layers of cloth, as explained.

Also, the arrangement of the tank E with the vaporizer and the air-pumping apparatus, such tank being made to communicate with the vaporizer by means of an overflow pipe x leading up into the vaporizer, as specified.

Also, the peculiar valve apparatus at the top of the vaporizer, the same consisting of the tube e, the box f, the holes g g, and the annular valve h, arranged together as described.

Also, the combination of the fluid elevator and its operative mechanism, or their equivalents, with the vaporizer, arranged substantially as described.

Also, the fluid elevator, or its equivalent, so arranged as automatically to elevate the carbureting liquid to the top or upper part of the vaporizer, substantially as described.

65,297.—ARCHIBALD STEWART, Troy, Wis.—*Draft Equalizer for Horse Powers.*—May 28, 1867.—The power is communicated through a coiled spring to prevent jerking and sudden decrease of speed.

Claim.—The combination of the tumbling rod A, outer cylinder B, coiled spring E, interior cylinder or roller C, and rod D, with each other, substantially as herein shown and described and for the purpose set forth.

65,298.—H. L. STUBBS, Savannah, Ga.—*Apparatus for Removing Water from the Holds of Vessels.*—May 28, 1867.—To put the ejector in operation the cup is lowered so as to expose the base of the bottomless cup in the direction of the vessel's progress. The passage of the water through the cone draws water from the hold through the axial pipe.

Claim.—First, the combination of the horizontal pipe C, bent outlet pipe D, and cone-shaped bottomless cup E, with each other, substantially as herein shown and described and for the purpose set forth.

Second, the combination of the shaft G and crank arms F and H, with the pipe D and bottomless cup E, substantially as herein shown and described and for the purpose set forth.

65,299.—E. B. TAYLOR, South Sudbury, Mass.—*Clothes Sprinkler.*—May 28, 1867.—The reservoir is suspended in an elevated position and communicates by an elastic tube with the nose, a valve opening or closing the passage.

Claim.—The reservoir A, with its pipe B, having extension flexible tube C, terminating in a perforated head or cap, provided with a lever, when all constructed and arranged together substantially as and for the purpose described.

65,300.—JAMES S. TAYLOR, Danbury, Conn.—*Machine for Sizing Hats, &c.*—May 28, 1867.—Improvement on his patent of May 3, 1853. An adjustable vibrating motion is given to the hats as they pass through the machine by the relative oblique position of the rollers.

Claim.—First, the diagonal vibrating felt G, constructed and operating substantially as and for the purposes set forth.

Second, the mode herein described of imparting motion to the roll of goods by means of the felt G, cranks N, pitmans L, and swings H.

Third, the combination and arrangement of screws K, sliding nuts I, and swings H, substantially as described, for the purpose of regulating the pressure of the felt G.

Fourth, the felt G, in combination with two or more rollers C, substantially as and for the purposes set forth.

65,301.—JOHN L. TENNEY and JOHN W. BAILEY, Skowhegan, Me.—*Compound for Coating Oilcloths, &c.*—May 28, 1867.—Nine parts slate and one part clay are pulverized, bolted, and mixed with linseed oil and Japan varnish as a paint.

Claim.—The use of ground slate and clay when compounded in or about the proportions set forth and used in the manner and for the purpose described.

65,302.—JAMES P. and LEMUEL THURMON, Warrenton, Mo.—*Medical Compound.*—May 28, 1867.—For the cure of scrofula, mercurial diseases, &c. Improvement on the patent of John Thurmon, April 4, 1865. To his prescription are added corn-meal, rye-meal, malt, sarsaparilla root, cedar top, bitter root, poke root, wild cherry bark, and burr vine root.

Claim.—The improved medical composition produced substantially with the ingredients mixed together in or about the proportions stated, in combination and in mixture with the medical compound herein referred to.

65,303.—LEONARD TILTON, Brooklyn, N. Y.—*Wood Splitting Machine.*—May 28, 1867.—The wood is dropped into a fixed hopper, through whose nearer side two knives having V-shaped transverse sections are alternately projected and retracted. The under knife projects further than the lower one and splits off slabs of wood which the former has checked. The hopper bottom is shaped like the under knife and reciprocates with it, each forming alternately the hopper bottom. The bottom piece is at a lower level and allows a fall of the wood at each stroke.

Claim.—First, the two reciprocating cutters G G¹ of V form, placed one above the other in reverse posi-

tions, and the lower cutter G^1 , in advance of the upper one G , substantially as and for the purpose set forth.

Second, the hopper H in combination with the cutters G^1 , and the holder K , substantially as and for the purpose specified.

Third, operating the holder K from the slide F , to which the cutters are attached by means of the rod L , connected with the slide as shown, and the spring N , as set forth.

Fourth, constructing the hopper H , of the vertical parts f, f' , one of which, f , is adjustable for the purpose of adapting the hopper to suit the length of the sticks to be split, as shown and described.

65,304.—LEONARD TILTON, Brooklyn, N. Y.—*Device for Transmitting Motion.*—May 28, 1867.—The rotary motion of the shaft is communicated by a belt and pulleys to the shaft of the spiral cam which reciprocates the bar. As the latter reaches the end of its stroke the belt shipper changes the belt to another pulley and runs the cam in the other direction.

Claim.—The cam D , and bar Q , in combination with the pulleys F, I, J , gearing H, C, c^*, c, E , belt H , and belt shipper composed of the arms N, N' , arranged and operated automatically from the bar Q , substantially in the manner as and for the purpose herein set forth.

65,305.—SAMUEL H. TITUS, Pennington, N. J.—*Clothes Dryer.*—May 28, 1867.—The crossing standards, and the spreader arms jointed thereto, carry the suspensory bars; the frame is held at any degree of extension by a spring catch and a ratchet wheel upon the roller, on which the adjusting bands are wound.

Claim.—The combination and construction of a clothes horse having the cross standards A, B and C, D , parallel arms E, F, G, H, E, I and F, H , roller L, L , and belts M, M , ratchet N , spring catch P , and thumb head O , with the clothes bars K, K, K , substantially as above described and for the purposes herein set forth.

65,306.—SAMUEL P. TOWNSEND, Union county, N. J.—*Finishing Iron Work of Plows, Stoves, Pipes, Levees, Dams, &c.*—May 28, 1867.—Omitting the usual finishing of iron work by grinding, polishing, &c., it is galvanized by dipping in a bath of molten metal, by which it acquires a smooth surface.

Claim.—First, the finishing of plows, iron work for levees, dams, etc., piling, and other iron and steel work known mentioned, substantially as described and for the purpose set forth.

Second, the restoration to good condition by the means described of iron and steel work which has been damaged by oxidation or corrosion.

Third, a new article of sheet piling, made substantially as described and for the purpose set forth.

65,307.—JAMES W. TUCKER, New York, N. Y.—*Hoisting Machine.*—May 28, 1867.—The platform is suspended from two ropes which pass over pulleys and unite before reaching the drum, on which they are wound by a windlass. A dog is engaged to hold the platform at any height and a friction band allows its descent at a moderate speed when required.

Claim.—First, the arrangement of the pulleys d, e, f and bifurcated chains F in relation with each other and with the platform C , and winding drums E , substantially as herein set forth for the purpose specified.

Second, the locking dog J , and sliding shaft I , combined in relation with each other and with the gearing which operates to elevate the platform C , substantially as and for the purpose set forth.

Third, the friction brake K and pulley I , arranged with reference to each other and with the sliding shaft I , and the gearing which operates to raise the platform C , substantially as herein described for the purpose specified.

65,308.—WM. TUCKER, Paris, Ill.—*Wood Planing Machine.*—May 28, 1867.—The adjustable rotary planing head can be changed instantaneously to either right or left hand cutting to suit the grain or direction of the wood in any particular spot.

Claim.—The arrangement of the double cutter head E and friction pulleys K, L, L' , capable of being simultaneously shifted for right or left hand cutting, substantially as set forth.

65,309.—WILLIAM TUNSTILL, Paterson, N. J.—*Braiding Machine.*—May 28, 1867.—The thread delivery is from the end of the cop. A case protects the thread from dust. A ratchet wheel aids the delivery of the yarn when the rising finger releases the pawl. The friction wheels may either or both be faced with leather, and an elastic rubber washer compensates for inequalities in the friction surfaces. In starting, a lever is lifted to bring the leather-covered rollers into contact, when it is locked in that position. When a thread breaks a weight falls, and by acting on the lock bar permits the friction wheels to separate.

Claim.—First, the case p fitted upon the carrier d in a braiding machine and containing the bobbin or cop from which the thread passes off upon the line, or nearly so, of the axis of said bobbin or cop, substantially as and for the purposes set forth.

Second, the ratchet pulley q over which the thread passes pawl 2 and finger 6 in combination with the weight r , substantially as and for the purposes specified.

Third, the grooved ratchet wheel q over which the thread passes, pawl 2 and weight r , in combination with the cop or bobbin p' , substantially as and for the purposes specified.

Fourth, friction wheel applied in substantially the manner specified, between the driving pulley k and the main shaft l of a braiding machine, in combination with the stopping and starting mechanism, so that the machine may commence to move gradually instead of suddenly, as set forth.

65,310.—EDWARD A. TURNER, New York, N. Y., assignor to himself and JOHN MORRISSEY, same place.—*Car Coupling.*—May 28, 1867.—The coupling link has lateral projections which limit its entrance into the draw head, where it trips the jointed coupling pin and becomes engaged thereto.

Claim.—The coupling link C furnished near one end with the laterally projecting ears or lugs h in combination with the draw head A and a suitable coupling pin, substantially as herein set forth for the purpose specified.

65,311.—THOMAS URIE, Springfield, Iowa.—*Wagon Brake Lock.*—May 28, 1867.—The brake lever is held by a pawl and ratchet teeth on a segmental rack; the pawl is raised by a rod, whose lateral projection slides in a slot of the lever near the hand.

Claim.—The eccentric c , in combination with the rod d , the slotted lever a and the segment plate b , for locking a wagon brake by means of the connecting rod g , constructed, arranged, and operated substantially as and for the purposes described.

65,312.—JOHN H. VAN SANDT and JAMES J. HURT, Princeton, Ind.—*Rotary Steam Engine.*—May 28, 1867.—The cylinder is divided and traversed by a shaft, which has pistons attached in each chamber. At each end of the shaft is a cam, which actuates the steam valve of its appropriate cylinder, the valves recoiling by the force of springs in time to let the pistons pass.

Claim.—The arrangement of the cams G , springs g , valves F , with reference to the system of cranks e , connections leading from the shaft L , substantially for the purpose specified.

65,313.—WILLIAM VAN WYCK, Belleville, N. J.—*Composition for Filtering Petroleum, Sirup, and other Liquids.*—May 28, 1867.—Dissolved animal matter, as glue, is mixed with chalk to the consistency of gruel, and pulverized wood charcoal is added to the consistency of putty. Carbonize the compound in a closed vessel.

Claim.—The application of the above mentioned compound of soluble animal matter, chalk, and wood charcoal, for the purification of petroleum and other oils, sugars, sirups, and molasses, and spirituous liquors by filtering these substances through the above mentioned compound, or by any mode equivalent to filtration.

65,314.—GEORGE W. VENNOR, Charlestown, Mass.—*Photographic Camera.*—May 28, 1867; antedated May 15, 1867.—The diaphragm is connected to the camera by a sliding frame and folding screen. The sensitive plate is moved so as to bring each part

of it successively opposite to the perforations in the diaphragm.

Claim.—First, the compound sliding frame M and J, made substantially as described and for the purpose set forth.

Second, the method of operating the said sliding frames M and J by means of the bar H, roller I, caps c c or their mechanical equivalent, and the lower part of the adjusting board C.

Third, the folding screws d d', substantially as described and for the purpose set forth.

65,315.—S. H. WADE, Montgomery Centre, Vt.—*Butter Worker.*—May 28, 1867.—The tray is revolvable on a pivot, and resting in a slide may also be drawn in or out under the presser-blocks, which are suspended from a bridge-piece and operated by a lever.

Claim.—First, the combination of the pressers E, sliding beam G, and operating levers H and J, with each other and with the frame of the machine, substantially as herein shown and described and for the purpose set forth.

Second, the combination of the pivoted table D and sliding frame B with each other and with the frame of the machine, substantially as herein shown and described and for the purpose set forth.

65,316.—WILLIAM R. WALDRON, Webster, Mich.—*Device for Unloading and Stacking Hay.*—May 28, 1867.—Two tripods are erected at a distance to admit a wagon between. The hay is raised by a cord running in sheaves suspended from the tripods, and is drawn by a horse.

Claim.—The combination of the poles, pulleys, rope, and anchorage, when arranged substantially as herein described and for the purposes herein set forth.

65,317.—F. M. WELLER, Evanston, Ill.—*Carriage Shackle.*—May 28, 1867; antedated May 16, 1867.—The thill iron has a circular disk with a hook flange at each side; the flanges engage studs on the cheeks of the shackle iron in front of the clip.

Claim.—The carriage shackle constructed and operating substantially as described and specified.

65,318.—JESSE S. WHEAT, South Wheeling, W. Va.—*Car Seat.*—May 28, 1867.—The reversible back is connected to the ends of the seat by slotted links and T-shaped pivoted arms, and is thereby retained at any inclination. The back rests in double inclined racks, which support it at either side of the seat and at any desired elevation. The guide plates confine and protect the connections.

Claim.—First, the cross-head arms D and slotted links c, in combination with the back of the seat C and the ends A, arranged and operating substantially as and for the purposes herein described.

Second, the double inclined racks E, in combination with the guide plates c, arranged and operating as and for the purposes specified.

65,319.—W. W. WHIDDIT, Richmond, Ind.—*Machine for Cleaning Flax.*—May 28, 1867.—A cylinder armed with teeth runs in a box with a grated bottom. The top of the box has an automatic hopper which discharges its contents into the box at given intervals, and the flax is discharged from the box at alternate intervals.

Claim.—First, constructing a machine for cleaning flax, &c., with a door L, or its equivalent, by which said machine is closed and the material confined until cleaned, substantially as set forth.

Second, the octagonal-shaped cylinder I, having flanged ends, substantially as described and for the purpose specified.

Third, the reversible hopper B, operating on journals, substantially as specified.

Fourth, the arrangement and joint operation of hopper B and door L, substantially as set forth.

Fifth, loose pulley c, provided with pin n and ring o, or their equivalents, wheel D, either with or without teeth, provided with cam S, the latter either permanently attached or adjustable, in combination with slide P, detent T, and device W, all arranged substantially as set forth and for the purposes specified.

65,320.—EDWARD WHITE, Philadelphia, Pa.—*Apparatus for Cooling Liquors on Draught.*—May

28, 1867.—The cylinder is lined with zinc and covered with felt. It has a hole above for the introduction of ice, and contains an enlargement of the beer pipe whose contents are to be cooled.

Claim.—A cooler covered with felt ice-chamber, as described, opening a block B and cylinders C, constructed and operating substantially as specified.

65,321.—JOHN R. WILLIAMS, Taunton, Mass.—*Composition to be used as Putty for Stone Work.*—May 28, 1867.—Composed of decomposed slate rock, 1 pound; lime, 1 ounce, and linseed oil, 5 ounces.

Claim.—The improved composition of matter herein described for the purpose specified.

65,322.—JOHN B. WORTHAM, Huntsville, Ala.—*Lamp Burner.*—May 28, 1867.—The wick tube has a brass collar, having teeth at its periphery to enter slots in its surrounding cylinder, which carries the hinged cone. This cylinder slides on the main cylinder, to which the wick tube is attached, and is elevated to position for use by a coiled spring, but may be depressed sufficiently to give access to the wick for lighting.

Claim.—First, the ventilating collar or cylinder c, constructed and operated and for the purposes substantially as herein set forth.

Second, in combination with the cylinder c, the toothed edge of the plate b, or its equivalent.

Third, the plates i and j, for holding the cap open, as described.

65,323.—FRANCIS H. WRIGHT, Richmond, Ind., assignor to himself, WILLIAM C. SLADE and B. M. PRATT, same place.—*Tanning.*—May 28, 1867.—Composed of catechu, saltpeper, glabner salts, Spanish whiting, sulphuric acid, and salt, for tanning leather, and of saltpeper, alum, salt, and sulphuric acid, for tanning furs.

Claim.—The use of the proportion of ingredients named in formule A and B, and the manner of applying the same to hides, furs, and skins, for the purpose of tanning the same rapidly and effectually.

65,324.—JOHN WRIGHT and J. J. JOHNSON, Cold Water, Mich.—*Corn Harvester.*—May 28, 1867.—The machine is drawn by a single horse, and cuts two rows at once. One of each pair of knives has an oblique motion by guides operated by an eccentric shaft. The corn is received on a platform with a curved railing, where it is gathered and shoeked and from which it is discharged by the tilting of the platform.

Claim.—First, the arrangement of the knives B B with double or oblique motion, operated with slotted guides, or their equivalent, in combination with the stationary knives A A, substantially in the manner and for the purposes herein set forth.

Second, the tilting platform K, in combination with the stationary platforms F F, the spring-curved arms M M, and spring catch L, or its equivalent, substantially in the manner and for the purpose as herein described.

Third, the cutting knives, as arranged and operated in combination with the tilting platform, substantially in the manner and for the purpose as herein described.

65,325.—P. ZERN and W. WARWICK, Pittsburg, Pa.—*Machine for Cutting off Cigars.*—May 28, 1867.—The two disks have agreeing countersunk holes varying in size. One of the disks is oscillated by a pressure knob to cut off the cigar end. The disk is restored to position by a spring.

Claim.—The combination of the upright B with opening C and plate E, having similar openings, when the two are arranged and combined together, substantially as and for the purpose described.

65,326.—PHILIP M. ACKERMAN, Webster, N. Y.—*Gate.*—June 4, 1867.—Two of the bars slide on rollers upon two fixed posts, a bar sliding in the gate passes between the rollers, and serves to sustain the advanced end of the gate when nearly closed.

Claim.—The loose sliding bar D, having a suitable supporting head H, in combination with the sliding gate, substantially in the manner and for the purposes herein shown and described.

65,327.—J. B. ALEXANDER, Washington, D. C., assignor to himself and JAMES C. DUNCAN, Olney, Ill.—*Gate*.—June 4, 1867.—The vertical pivots on the beam and sill traverse in the holes, bored axially in the top and bottom of the gate post, as the latter raises by the twisting of the suspension chain, and returns again by gravity when freed.

Claim.—A gate, so constructed as to be suspended by chains attached to and wrapping spirally on the center piece D, causing the gate to close of its own weight, or the same device, composed of any other material, substantially as described and for the purpose set forth.

Also, the pins L and K and the bores R and Q, substantially as described and for the purpose set forth.

65,328.—JOHN BATCHELDER, Norwich, Conn.—*Self-lubricator*.—June 4, 1867.—The drip cap has a side compartment, separated from the main part by a porous division; a rotating disk within this compartment throws the oil into a small conduit, which drips into the oil hole of the journal.

Claim.—First, the revolving plate *c*, the conductor *d*, the vertical flange *e*, the hood *i* and the arrangement of the bar and strainer *g* in the dripping pan.

Second, the combination of the revolving plate *c* and the conductor *d*, or its equivalent, all for the purposes herein described.

65,329.—HORACE R. BALL, New York, N. Y.—*Truss*.—June 4, 1867.—By means of the adjustments described, the pad is made to face up or down, and to press with the required force, either above or below the hoop.

Claim.—First, the bar B, pivot *e*, link D, and set screw C for regulating the lateral set or facing of the pad A, all arranged and acting as herein shown and described.

Second, the bar B, socket *b*, and set screw *g*, in combination with the hoop K and pad A for regulating the vertical facing or set of the pad, as and for the purpose set forth.

Third, a pad A, having a bar B, socket *b*, pivoted to the end of the hoop K by a pivot *f* and set screw *j*, for regulating the pressure of the pad upon the body, arranged substantially as herein shown and described.

Fourth, the combination of the pad A, bar B, with a perforated fan tail H, pivot I, set screw *i*, and hoop K for throwing the pad below or above the hoop, substantially as herein explained.

65,330.—O. C. BARNES, Stowe, Vt.—*Mop Wringer*.—June 4, 1867.—The rectangular water box is pivoted with a lever treadle that moves a follower, placed on perforated platform in the upper part of the box to squeeze the mop.

Claim.—The follower D, with the jointed head block *g*, in combination with the treadle bar *b*, arranged and operating substantially as and for the purpose herein set forth.

65,331.—J. B. BEHRENS, Pearl, Ill.—*Car Coupling*.—June 4, 1867.—The two heads of the jointed coupling bar catch behind transverse abutments in the draw-head, the coupling end slipping up the inclined face of the abutment and falling behind. A lever and arm raises it to uncouple. It is self-declating when one of the cars leaves the track.

Claim.—An improved car coupling, formed by the combination of the peculiarly constructed bumper heads A and B, jointed-coupling bar D, spring E, supporting rod F, uncoupling lever G, and operating rod H, with each other, substantially as herein shown and described for the purposes set forth.

65,332.—C. G. BENNET and S. A. DRAKE, Farmer Village, N. Y., assignor to C. G. BENNET, same place.—*Wagon Brake*.—June 4, 1867.—The brake rod is pivoted to the rear bolster and slides in the slots of two cam levers, which are connected to the hand lever which raises the rubber from the wheels, or depresses them into contact therewith.

Claim.—First, in combination with the brake bar *b*, the relieving or raising cam C, constructed and operating as and for the purposes herein shown and described.

Second, suspending the brake blocks B of wagons

and other vehicles from an axial point, located near that of the ground wheels *w*, substantially in the manner and for the purposes herein shown and described.

65,333.—A. BERARD, Paris, France.—*Manufacture of Steel*.—June 4, 1867.—The gases blown through the molten metal in the first sole plate oxidize and eliminate the substances, which form a complex alloy with the iron. The resulting gas from the air-blast is passed through the fire-bridge between the two sole plates, and carried to the other sole plate to reduce the metal therein. The sole plates are removable for repairs or renewal.

Claim.—First, the peculiar arrangement or construction of a reverberatory furnace with a double movable sole plate, as hereinbefore described and shown in Figs. 1 2 and 3.

Second, the interposition of a bed of fuel in the current of the gas, as hereinbefore described.

Third, the mode of action of the gas of the steam and of the air on or in the interior of the metallic bath, in the manner hereinbefore described.

Fourth, the arrangements above described for causing the scoria to act on the metal for eliminating the phosphorus and other injurious foreign matters therefrom, as hereinbefore described.

Fifth, the reaction of heat from the oxidizing sole plate on the reducing sole plate, as hereinbefore described.

Sixth, the arrangements for operating at will by way of oxidation and reduction, successively for purifying cast iron and for its reduction into steel or iron.

65,334.—MARTIN T. BRIGGS, Schoolcraft, Mich.—*Hane Strap*.—June 4, 1867.—The other two of the three parts which are pivoted together have hooks to engage the hane ends, and the folding of the parts together draws the hanes to the required position.

Claim.—A jointed metallic hane strap, composed of three parts, A, B, and C, constructed and operating substantially as set forth, and provided with a holding device to lock and retain the parts in holding positions.

65,335.—PARCEL BRINKERHOOF, Chillicothe, Mo.—*Measure for Liquids*.—June 4, 1867.—The receiving vessel has interior tubes and apertures, so arranged by turning a tube within the receiving vessel any given quantity of liquid within the capacity of the reservoir will be measured and discharged therefrom.

Claim.—The central tube C, having index levers E, F, spirally arranged, perforations *b*, in combination with the tube B of the vessel A, having corresponding perforations and graduated top G, and operating substantially as described for the purpose specified.

65,336.—R. F. BROWN, Savannah, Ga.—*Steam Rotary Valve*.—June 4, 1867.—The oscillating valve is a chambered-conic frustum with induction and ejection passages. The ports and parts are so arranged and proportioned as to secure an even pressure on the valve in its middle position, and when exhausting to cause the exhaust steam to react against the shell of the seat.

Claim.—The arrangement of the induction passage C, ejection passage D, with reference to the passages C C, and valve B, substantially upon the principle and in the manner as herein set forth.

65,337.—JAMES BUDD, Pittsford N. Y., assignor to himself and J. W. BRIGGS.—*Churn Power*.—June 4, 1867.—An anti-friction roller on the adjustable lever of the dasher traverses a cam groove in the main wheel. The shaft of the said wheel is turned by a winch to raise a weight which acts by a ratchet and pawl to rotate the wheel and reciprocate the dasher.

Claim.—The lever B, in combination with the churn and the wheel W, when the said lever is provided with a variable axial point with relation to the roller *r* as shown at *f*, substantially as and for the purposes set forth.

65,338.—M. D. BUDD, Roscoe, Ill.—*Bolt and Rivet Trimmer*.—June 4, 1867.—To enable the moving jaw to open wider it is jointed, and the portions are clasped together by a spring stirrup which

is pivoted to one piece and engages with such notch on the other piece as may secure the required adjustment.

Claim.—The combination of the spring *g*, the clasp *d*, and the guide *h*, arranged substantially as described.

65,339.—WM. BUTCHER, jr., Sheffield, England, and THOS. SHAW, Philadelphia, Pa.—*Machine for Shoting Metals.*—June 4, 1867.—Melted metal is poured through a funnel upon the disk and thrown off like spray in size proportioned to the speed of the disk, which is cooled by a water passage. The shot falls into a tank.

Claim.—First, the employment of a rotating disk for the purpose of throwing molten metal off in particles, as set forth.

Second, the employment of configured heat-enduring substances, for the purpose described.

Third, the introduction of water passages, substantially as and for the purpose set forth.

65,340.—CHARLES E. BUTLER, Hudson, N. Y.—*Weather Strip.*—June 4, 1867.—The strip has transverse slots with slide pins and springs, which press it toward the door.

Claim.—The elastic weather strips, formed by combining with the slotted strips *B*, the slotted plates *C*, screws *D*, and springs *E*, all made and operating substantially as herein shown and described.

65,341.—C. A. BUTTLES and JAMES COWLES, Milwaukee, Wis.—*Tinners' Stoves for Heating Soldering Irons.*—June 4, 1867.—The furnace is divided by a vertical corrugated partition near the rear side and perforated at the bottom. This partition is carried up to a semicircular damper in the exit flue. In starting the fire direct escape is allowed for the caloric current; afterward it is forced through the bottom perforations of the partition.

Claim.—Dividing the interior of the stove or fire pot by a perforated division or partition plate *d*, in combination with the divided exit flue *e* and its damper *g*, substantially as and for the purpose described.

Also, the bent arm and weight *k m*, in connection with the hinged lid *E*, as and for the purpose described and represented.

65,342.—HENRY G. CARR, Lewistown, Pa.—*Protector for Car Windows.*—June 4, 1867.—The strip is grooved on the side and attached by a hinge to the sash frame of a car window, one on each side. They are opened by the action of the wind and then stand at right angles to deflect cinders, &c., from the open window.

Claim.—The self-acting grooved protector, constructed and operating as herein described and for the purposes set forth.

65,343.—WM. S. CARR, New York, N. Y.—*Basin Plug.*—June 4, 1867.—Instead of guiding the metallic plug into place, it is furnished with guides to keep it vertical and has an elastic disk which turns up at its edges on entering the waterway.

Claim.—The plug for waste waterways, provided with an elastic disk and guided in the manner as and for the purpose set forth.

65,344.—E. P. CARTER, Arcade, N. Y.—*Trunk.*—June 4, 1867.—The encircling bands of the lid are looped to those of the body and form hinge straps. Loops on the band afford attachment for straps.

Claim.—First, as an improvement in the construction of trunks and valises forming the hinges by connecting the ends of the incircling bands of the cover to the incircling bands of the body, substantially in the manner set forth.

Second, providing the front ends of incircling metallic bands of trunks and valises with links for the reception of connecting straps, as and for the purposes shown and described.

65,345.—ALANSON CARY, New York, N. Y.—*Steam and Water Heating Apparatus.*—June 4, 1867.—The cases are heated by steam which passes from one to another; vertical open-ended pipes trav-

erse the cases and afford passage for the circulation of air.

Claim.—The combination and arrangement within the case *D* of one or more series of inclined steam cases *A*, united together at their edges by means of the angular plates, and connected by steam pipes *B*, each plate provided with air tubes *C* passing through them, the tubes in the lower series not being in the same vertical plane with the tubes in the upper series of cases, substantially as described and for the purpose specified.

65,346.—HIRAM L. CHASE, Bath, Maine.—*Press or Cover for Tubs and Barrels.*—June 4, 1867.—The cover lies upon the meat in the barrel, and is kept down below the brine by the engagement of the points of the pivoted arms with the inside of the barrel.

Claim.—The combination of one or more eccentrically pivoted arms *C*, or their equivalent, with the cover or press *A*, substantially in the manner herein shown and described and for the purpose set forth.

65,347.—J. W. CLARK, Iola, Kansas.—*Guard for Circular Saws.*—June 4, 1867.—The cover is pivoted to a hinged frame and rises by the contact of the lumber with a self-adjusting drop in front, which falls just as the last end of the plank is coming to the saw, and prevents the hand coming in contact therewith.

Claim.—The saw guard *B*, provided with the self-adjusting drop *c*, and suspended on the vibrating frame *D*, constructed and operating substantially as and for the purposes herein described.

65,348.—WELLSLY W. CRANE, Auburn, N. Y.—*Self-Lubricating Box and Hanger for Shafting.*—June 4, 1867.—The wrist in the pedestal permits the box to adjust itself to any horizontal deflection of the shaft, and the trunnions of the inner boxing allow the box to conform to vertical deflection. The slots in the inner boxing have a wick which leads the oil to the shaft. Horizontal adjustability is given by the slotted ears of the pedestal, and vertical by the bolt and nuts.

Claim.—First, the adjustable hanger, when constructed substantially as above described, so as to adjust both on the vertical and horizontal planes, as above set forth.

Second, the combination of the vertical and horizontal joints above described, when used for the purpose and constructed in the manner substantially as above specified.

Third, in combination with the above joint, the self-lubricating box, when used as and constructed substantially in the manner specified.

65,349.—WELLSLY W. CRANE, Auburn, N. Y.—*Constructing Self-Lubricating Pulley.*—June 4, 1867.—A chamber in the hub of the pulley is charged with oil and closed up. The pulley revolves around the central shaft which runs through the inner sleeve holes admitting the passage of oil to the shaft. The feather edges of the end cups prevent the collection of oil between them and the shaft.

Claim.—First, the chamber *E*, above described, when used substantially in the manner and for the purpose above specified.

Second, constructing the internal or shaft bearing *A*, independent of the main portion of the pulley, as and for the purpose above described.

Third, feather-edging the ends of the pulleys, for the purpose and in the manner above set forth.

65,350.—FRANCIS P. CULLOM, Dowagiac, Mich.—*Plaster Sower.*—June 4, 1867.—The lower portions of the inclined sides of the hopper are corrugated; one is reciprocated longitudinally by power derived from one of the ground wheels, and the other side is pivoted so as to graduate the width of the opening.

Claim.—First, the construction of the hopper of a plaster sower of stationary ends *a a*, stationary inclined side *b*, reciprocating slide *c*, and pivoted adjustable side plate *b'*, substantially as described.

Second, the corrugating of the inner surface of the slide *c*, in combination with the corrugated side-plate *b'*, and means for regulating the discharge of plaster from the hopper, substantially as described, for the purpose set forth.

65,351.—J. B. CURTIS, Hillsdale, Mich.—*Brick Machine.*—June 4, 1867.—The molds in the box conform in number to the openings in the floor of the jack mold; the box is moved by the lever; the follower descends, pressing the clay; the molds are removed, the edges of the clay-box cutting off superfluous clay. Another mold-box is substituted, and as the latter wear, inclined planes raise the bed.

Claim.—The inclined planes J, carriage K, and molding boxes S, as arranged, in combination with the clay box L, jack mold M, and follower N, when operating conjointly for the purpose and in the manner set forth.

The arrangements of the shafts D G, cranks E H, arm and link Q R, in combination with the carriage K, for the purpose and in the manner substantially as described.

65,352.—WM. MORRIS DAVIS, Philadelphia, Pa.—*Drying Loaves of Sugar.*—June 4, 1867.—Explained by the claim.

Claim.—Forming a loaf of sugar with a hole through or into the interior of the loaf, for the purpose of expediting the operation of drying sugar loaves.

65,353.—JAMES DAYKIN, Cleveland, Ohio.—*Water Drawer.*—June 4, 1867.—As the bucket rises the bottom is tilted forward by the contact of the back part of the rim with a slanting board; the valve rod strikes another board and is opened thereby, discharging the contents into the chute.

Claim.—First, the pivoted head board I, arranged in relation to the valve of the bucket, substantially as and for the purpose specified.

Second, the adjustable head board or plate I and tilting board L, in combination with a chain or rope E, valve rod H, and bucket D, when arranged and operating in relation to each other, substantially as and for the purpose set forth.

65,354.—JOHN DICKASON, Vevay, Ind.—*Gate.*—June 4, 1867.—The equestrian presses the free ends of the lever handles consecutively, which swings the gate open and shut.

Claim.—First, the system of lever handles *n* and *n'*, connecting bars *o* and *o'* and circular lever bar D, in combination with the gate A, all arranged and operating substantially as and for the purposes specified.

Second, in combination with the gate A and the U-shaped lever bars E and E', which operate the cranks *f* and *m*, the connecting bars *c* and *l*, and the vertical lever F, and circular lever bar D, arranged and operating as described.

Third, the adjustable screw bolts *b* and *d*, circular lever bar D, or its equivalent, the post C and gate A, arranged substantially as herein described and for the purpose specified.

Fourth, the latch G, consisting of the latch bar *e*, secured to the spring *p* by the clamping strap *p'*, and the hand lever *r*, as described and for the purpose set forth.

65,355.—JOHN H. DICKINSON, Chicopee Falls, Mass.—*Hay and Straw Cutter.*—June 4, 1867.—The cutter head is hinged to the frame, which is pivoted to the rear portion of the machine so as to oscillate in an arc; the breast of the machine is correspondingly formed. The cutter is reciprocated by crank and pitman.

Claim.—A device for cutting hay and straw wherein the cutter shall rise and fall on the arc of a circle, using for that purpose the levers C C, the cutter A, the connections F, the shaft G, and the swing catch K, in combination.

65,356.—GEORGE W. DISMAN, Upper Sandusky, Ohio.—*Application of Soft Metal Bearings for Carriage and Wagon Boxes.*—June 4, 1867.—Explained by the claim.

Claim.—Making carriage boxes by first preparing soft metal rings of copper or of a composition of which copper is the basis, and placing said rings upon a sand or other core, and laying them in a properly prepared mold, and running molten cast-iron on or around said rings, as and for the purpose described.

65,357.—WALDEN EDDY, Greenwich, N. Y.—*Flow Beam.*—June 4, 1867.—The forward bolt which

holds the adjusting clevis is formed solid with the through portion of the beam. The draft rod is hooked between the bars of the beam to a transverse bolt.

Claim.—First, forming the adjusting bolt B solidly upon and out of the forward end of the plough beam, substantially as herein shown and described.

Second, securing the rear end of the draft bar F in the space between the bars *a* and *a'* of the plow beam A, by a bolt G passing through an eye or hook *f*² formed upon the rear end of the said draft bar F, substantially as herein shown and described and for the purpose set forth.

65,358.—JAMES E. EMERSON, Trenton, N. J.—*Saw-Set.*—June 4, 1867.—The gauging and sharpening swage has lips by which breadth is given to the cutting edge of the tooth. The shaping lips are secured to the swage stock by a set-screw, by which adjustment they are adapted for saws of varying thickness.

Claim.—In combination with the stock or swage head the adjustable or movable lips for giving to the tooth of the saw the shape or form herein shown and represented.

65,359.—B. HOMER FAIRCHILD and EMERY SADLER, Farmington, Mich.—*Gate.*—June 4, 1867.—One or more of the upper slats are extended to form a fence to larger animals, but allow passage to smaller ones when the gate is partially opened. The gate is run longitudinally backward to a balance on the anti-friction roller, and then turned 90° on its pivot.

Claim.—The latch D, constructed substantially as described, in combination with the post A and projecting bar *e'* of the gate C, substantially as herein shown and described.

Second, the pivoting attachment E F G, constructed substantially as described, in combination with the post D and the upper horizontal bar *e'* of the gate, substantially as herein shown, described, and for the purposes set forth.

65,360.—DENNIS L. FALARDO, New York, N. Y.—*Machine for Driving Nails.*—June 4, 1867.—The brads are placed on a revolving perforated disk; as the machine is operated a brad drops through the opening, when it comes directly over another slot in a lower plate, wherein the brad is guided to the place where it is to be driven; a blow upon a piston drives the brad into the wood, and upon the return movement of the piston it revolves the disk so that another brad is fed as before.

Claim.—The revolving wheel reservoir *d*, formed and fitted as described to the tube A, in combination with the tube *o* and the machinery connected therewith, in the manner and for the purposes set forth in this specification.

65,361.—OLIVER W. FARRAR, Pittsburg, Pa.—*Recovering Waste Acid for Refining Petroleum.*—June 4, 1867.—Improvement on the patent of E. G. Loftus, June 14, 1864. Weak acid obtained from the concentration or distillation of sulphuric acid is used instead of water alone. With this addition, the mixture is agitated in lead-lined vessels.

Claim.—The improved process of diluting the spent acid of oil refiners with weak sulphuric acid, as and for the purpose herein specified.

65,362.—M. S. FELLOWS, Livonia, N. Y.—*Washing Machine.*—June 4, 1867.—The rubbing roller is journaled in a pendulous frame, which reciprocates over the corrugated and perforated bed; a hinged roller acts as a pounder on the clothes, and forces them against the dash-board at each alternate reciprocation.

Claim.—The arrangement of the roller F, hinged pounder roller D, corrugated concave B', and dash-board *d*, in connection with the fountain or supply chamber *w*, as and for the purposes set forth.

65,363.—DANIEL H. FERNALD, Bangor, Me.—*Construction of Sewers and Drains.*—June 4, 1867.—The "former" corresponds in shape to the inner and outer circumferential lines of the lower half of the sewer, and is spaced and indexed upon its inner line so as to form a guide for the alignment of each course of brick in the said lower half.

Claim.—The adjustable indexed former D, substantially as and for the purpose specified.

65,364.—JOHN W. FIESTER, Winchester, Ohio.—*Fire-Place.*—June 4, 1867.—The oven is placed in the fire-place over the grate, and rests upon projections, leaving a fire-space in the rear.

Claim.—The combination of the plates D and E, key *a*, when constructed and arranged as described and placed over an open fire-grate, the parts operating as set forth and for the purposes described.

65,365.—A. L. FINCH, Sing Sing, N. Y.—*Building Block Machinery.*—June 4, 1867.—The steel lining plates of the mold are attached by screws from the outside to admit of removal and polishing. The slide that conveys the material to the mold presses out the finished brick beneath a stationary knife which turns the same.

Claim.—First, constructing the mold for building blocks of a detached metal frame with a lining of plates of steel held in place by screws passing in from the outside of said frame, in the manner and for the purposes specified.

Second, the slide *i*, that removes the pressed block and brings the loose material into position for being pressed in combination with the stationary knife for equalizing the thickness of the block, as specified.

Third, a movable board applied to the side of the mold frame, as specified, in combination with the slide *i* and stationary knife, for the purposes and as set forth.

Fourth, the arrangement of the slide rods 5 and *o*, and cams *p*, *q*, 7 and 8, for operating the feeding-slide *i*, and giving a vertical motion to the mold bed, substantially as set forth.

Fifth, connecting the gate of the feeding hopper with the mold-bed by an adjustable connection, so that the supply of material can be regulated and the gate be opened by the motion of the mold, as specified.

Sixth, the shaft *f* and the sectional gear *e* for raising the compressing hammer *c*, in combination with the mechanism moved by the same shaft, substantially as specified, for giving motion to the feeding-slide and to mold-bed *k*, as set forth.

65,366.—E. D. FINCH, Stanton, Mich.—*Soda Fountain.*—June 4, 1867.—The soda-water passes through the annular space between an ice chamber and an outer case containing some non-conductor of heat. Discharge faucets communicate with the soda-water reservoir and the ice chamber.

Claim.—The arrangement of annular refrigerating and non-conducting chambers B C, enclosing a central ice chamber D, and provided with faucets F and H, for the purposes explained.

65,367.—E. A. FLOYD, Macomb, Ill.—*Beehive.*—June 4, 1867.—The smooth metallic strip which forms the lower edge of the inner box opposes the ascent of the bee moth or its larva, and the space between the two boxes is exposed for cleaning by lifting the strips.

Claim.—First, a beehive consisting of an outer case A, resting close on a bottom board and an inner case B, having its lower portion consisting of a strip of smooth metal with its edge fitting tight on the bottom board, with the covered passage-way *n*, leading from the outside to the inner case, as shown and described.

Second, the pivoted bars *a*, arranged to operate in connection with the cases A and B, as described.

65,368.—ARTHUR L. FREEMAN, Manchester, England, assignor to SEWALL S. W. FOLSOM, Boston, Mass.—*Keg and Barrel for Paint and other materials.*—June 4, 1867.—The metallic head sets upon a shoulder within the chine of the barrel; a diametric strap forms a handle, and by lapping over the chine and down the sides of the barrel is the means of fastening the head in place.

Claim.—First, the fastening strap *g*, made as a handle for the keg head and so as to be employed for fastening the head and the upper hoop to the keg, in manner as specified.

Second, the construction of the upper hoop in two sections *m n*, connected by rivets or joint pins, as

set forth, and so applied to the keg as to enable either or both of such sections to be turned up and used as a bail, as specified.

Third, the combination as well as the arrangement of one or more legs or arms *o*, with the keg and said hoop made in two parts or sections *m n*, such arm or arms and sections being applied together and to the keg by means substantially as specified.

Fourth, the construction of the staves or body of the keg or vessel with the annular shoulder I and the head with the raised flanges, and also with the fastening strap, formed either with or without the handle, as above mentioned; the flange by its elasticity serving to make a tight joint, and the fastening strap to hold the flange and the rest of the head in place, relatively to the shoulder, as specified.

65,369.—JAMES FRENCH, Bellvernon, Pa.—*Machine for Washing Sand.*—June 4, 1867.—For washing earthy and vegetable matter from sand. The sand passes through a shaking riddle down a chute into a cistern, where it is stirred and raised by a revolving wheel, which discharges it into a chute leading to the next cistern, when the operation is repeated, being subjected to the action of water at each step.

Claim.—First, washing and elevating sand by a wheel working vertically, or nearly so, in a concave trough, such a wheel being provided on its outer circumference with blades inclined to the plane passing through them and longitudinally through the axis of the wheel to which they are attached, substantially as and for the purpose above set forth.

Second, the method of elevating and discharging sand from one basin into another by carrying the sand up on the blades of one or more elevating wheels and washing it into another basin or cistern by a jet or jets of water playing on such blades, substantially as and for the purposes described.

65,370.—HERMAN FROMM, East New York, N. Y.—*Propeller.*—June 4, 1867.—Explained by the claim and illustration.

Claim.—The combination of a windmill and an ordinary horse-power with the screw-shaft of a vessel, substantially as described for the purpose specified.

65,371.—H. GANNEY, Louisville, Ky.—*Watch.*—June 4, 1867.—The hair-spring passes through one of two parallel arms projecting from the stud, and is attached to the other arm. A set-screw regulates the distance between the arms. The sides of the arms facing inward are of brass, the other sides of steel, to form a compensation. The main spring is not directly attached to the barrel, but to the end of a spring fixed thereto.

Claim.—First, securing the outer end of the balance spring of a watch to a stud formed with two spring arms C C2, having set-screw D, when arranged and connected together, substantially in the manner described and for the purpose specified.

Second, forming each arm C C2 of brass and steel, substantially as and for the purpose described.

Third, securing the outer end of the main spring of a watch movement to and within the barrel by means of a supplementary spring coiled in the reverse direction, substantially as and for the purpose specified.

65,372.—MANSON F. GIBBS, Livonia, N. Y.—*Portable Fence.*—June 4, 1867.—The base piece is notched to receive the superstructure, and has an end projection, serving as a pin to traverse the brace. The uprights pass through an open-ended slot in the brace and are held by a pin.

Claim.—Locking the two vertical stakes or bars C and E together at the bottom by means of pins *c*, or their equivalents, entering the bed-plate B, and at the top by passing the ends *e* through a suitable mortise in the diagonal brace A, the foot of that being similarly locked to the bed B, as and for the purposes set forth.

65,373.—M. F. GIBBS, Livonia, N. Y.—*Car-Coupling.*—June 4, 1867.—The entering end of the link is supported on a spring lever which is thrown down by the approaching drawhead when the link

has entered. The coupling-pin is supported by a spring bolt forced back by the entering link.

Claim.—First, the hinged ball C, with its projecting cam or latch D, in connection with the spring s, substantially as and for the purposes shown and described.

Second, the combination of said spring ball C, and the latch with the automatic "pin dropper," substantially as and for the purpose set forth.

65,374.—CHARLES H. GODFREY, Stewartville, N. J.—*Seed Box for Grain Drills.*—June 4, 1867.—The cams of the seed-agitator have three spurs inclined backwardly and curved spirally.

Claim.—The irregular cams e, on the stirring shaft D of a seed box for grain drills, substantially as and for the purposes described.

65,375.—WILLIAM A. GREENE, Troy, N. Y.—*Cooking Stove.*—June 4, 1867.—The inner side of the grate rests on a tubular attachment to the oven plate, through which air passes from side to side.

Claim.—First, in combination with an oven front plate, a shelf plate a, so constructed and arranged in respect to said oven plate as to form in connection therewith a hollow shelf plate, substantially as and for the purposes set forth.

Second, the detachable shallow shelf plate a, applied below the grate and above the ash-box, in combination with the front oven plate B, and the perforated side plates F, substantially in the manner and for the purposes herein described.

Third, the angular shelf plate a, substantially as and for the purposes described.

65,376.—H. C. GRIFFIN, Franklin, N. H.—*Magic Arrow Toy.*—June 4, 1867.—The bolt has a forwardly entering notch which engages a rubber cord extending from the yoke, and is projected when released.

Claim.—The elastic cord B, attached to a forked or other suitable bar A, and the notched arrow C, all arranged substantially as and for the purpose specified.

65,377.—GEORGE GUENTHER, New York, N. Y.—*Drying Glue.*—June 4, 1867.—The steam-heated cylinder is revolved, and the trough is elevated, charging the surface of the cylinder with a coat of glue; the trough is lowered, the glue on the cylinder dried and removed by a scraper.

Claim.—The mode of drying glue by revolving or rotating metallic surfaces, having their temperature raised either by steam or hot air, substantially as described.

65,378.—GEORGE HALL, Middletown, Ohio, assignor to himself and WILLIAM S. WALDRON, same place.—*Clapboard Gauge.*—June 4, 1867.—The tool is used to assist in scribing the projecting end of a weather-board in line with the corner strip against which the edge of the plate is held.

Claim.—The combination of the rule B with the gauge-plate C, when hinged upon the handle A, in the manner described and for the purpose set forth.

65,379.—WILLIAM S. HARRIS, Eckford township, Mich.—*Wool-packing Table.*—June 4, 1867.—The folded fleece is laid on the packing head; the two opposite long flaps are turned up, entering the pins of one into the holes in the other, the position being sustained by clamps. The short flaps are then raised, being locked by springs on the former. The head is raised by the treadle, the fleece tied both ways and then released.

Claim.—First, the employment of longitudinal and lateral grooves in the upper face of the packing head M, in combination with the notches in the table flaps to secure the baling twines o, when said head is so arranged as to project above the surface of the turned down flaps, substantially as set forth.

Second, the abutment pins F, in connection and combination with the flaps F¹ F², for forming a top abutment over which the fleece may be tied both ways, substantially as specified.

Third, the use of the connected and jointed clamps H H, in combination with the spring stops S, for securing the table flaps when acting as a press box, substantially in the mode herein described.

65,380.—JAMES HASLAM, Philadelphia, Pa., assignor to M. J. COLEMAN, same place.—*Nut Machine.*—June 4, 1867.—The nut is pushed through the feed hole into the recess of the catch, which keeps it square. The punching pin rises and lifts the catch and nut, and holds them while the edges of the latter are squared.

Claim.—The catch G, constructed and arranged substantially as described in combination with a nut machine, for the purpose set forth.

65,381.—JOEL HEACOCK, Marlboro', Ohio.—*Beehive.*—June 4, 1867.—The box stands on feet. An adjustable plate on the inside descends to the platform and forms a barrier to the ascent of moth or larva.

Claim.—The quadrangular sheet-metal slide E, fitting into the lower part of the hive A, and sliding between guides e', its bottom edges resting upon a stand or table between the feet f, and provided with the entrance g, substantially as described for the purpose specified.

65,382.—E. F. HOFMANN, Poughkeepsie, N. Y.—*Pessary.*—June 4, 1867.—The pessary fits around the neck of the uterus; its posterior depression fits the convexity of the sacral vertebrae and its anterior surface to the neck of the bladder. The elevation of the upper surface supports the cul-de-sac and the flat inclined surfaces keep it in position.

Claim.—A pessary made wedge-shaped and provided with concave surfaces b c, an elevation d, and flat retreating surfaces e, substantially as and for the purposes set forth.

65,383.—JAMES HOTCHKISS and EZRA BUSS, Springfield, Ohio.—*Brick Machine.*—June 4, 1867.—The horizontal mold wheel turns intermittently under a vertical pug mill, from which the molds are successively filled, and thence passes under a piston or platen by which the bricks are pressed in the molds, from whence they are subsequently lifted and then turned on edge by a tilter ready for the off-bearers.

Claim.—First, the combination and arrangement of the driving cam wheel C and rock shaft levers E F, for operating the mold wheel and pressing toggles, substantially as herein specified.

Second, the combination of the pawl H I, adjustable in length with the notches J J in the periphery of the mold wheel, or their equivalents, substantially as and for the purpose herein set forth.

Third, the extension of the pug mill beyond the center of the mold wheel so that the latter may extend under the entire bottom of the former without diminishing the diameter of the same, substantially as and for the purposes herein specified.

Fourth, the employment of the bottom plate V of the pug mill as a bearing for the upper journal of the mold wheel, the said plate being secured to the framework by suitable projections a a, substantially as and for the purpose herein set forth.

Fifth, the central depressions w in top of the mold wheel when combined with the extension of the bottom plate of the pug mill downward therein, for the purposes herein set forth.

Sixth, forming the pressure plate n, mortise or guide in an extension of the bottom plate V of the pug mill, as set forth.

Seventh, the combination with each other of the mold wheel W, the arc-shaped groove m' in the bottom of the pug mill, the crescent-shaped apertures R through the same, and the fillers r r, arranged and operating together, substantially as and for the purposes herein specified.

Eighth, the employment of two scrapers P Q, acting successively, one while the clay is under pressure and the other after the clay is relieved from pressure, substantially as and for the purpose herein set forth.

Ninth, the movable scraper A' acting in the opposite direction to that of the stationary scrapers, substantially as and for the purpose herein specified.

Tenth, the lowering of the followers so as to sink the bricks after being molded somewhat further in the molds to receive the pressure of the piston, substantially in the manner and for the purpose herein specified.

Eleventh, the adjusting screws b' b, which support and adjust the followers in the mold when they are

set in lugs *a a'* which project into the mold mortises, substantially as specified.

Twelfth, the construction and arrangement of the toggles *M M* with the spring *m*, and operating upon each other by a cam action, substantially as herein set forth.

Thirteenth, the vibrating tilter *T*, when operated by a lever *U* and cams *T T*, substantially as herein specified.

65,384.—ELIAS HOXIE, Montezuma, N. Y.—*Securing Wagon Seats.*—June 4, 1867.—The bolt engages a nut beneath the seat, and its head is held by a staple fastened to the floor of the bed.

Claim.—First, securing the seat to the wagon sill by means of two or more bolts *F* extending from the sill *A* to the sill *C*, so that no holes are made in either for the said bolt to pass through, nor are they otherwise weakened as set forth.

Second, the bolt *F*, in combination with the nut *D* and slotted plate *E*, all made and operating substantially as herein shown and described.

65,385.—ELIAS HOXIE, Montezuma, N. Y.—*Wheel for Vehicles.*—June 4, 1867.—The metallic band encircles the hub; the ends of the spokes are driven through it and stayed on alternate sides by the zigzag flange which forms partial sockets therefor.

Claim.—The metal ring *B* arranged around the hub *A*, and provided with a zigzag flange *C*, substantially as herein shown and described.

65,386.—MOSES G. HUBBARD, SYRACUSE, N. Y.—*Running Gear for Harvesters.*—June 4, 1867; antedated May 26, 1867.—For throwing the cutting apparatus in and out of gear. A spring upon the shift-lever throws the clutches into engagement without subjecting them to the pressure of the spring, the pressure being sustained by the lever and cam face over which it moves. Bolt plates upon the wooden frame prevent the bolt heads from sinking into the wood and turning therein.

Claim.—The vertical handle *A*, in combination with the cam *D*, formed in the horizontal plate *B*, and with that part of the gear designed to be moved or shifted out of gear, substantially as and for the purpose set forth.

Also, the employment of the bolt plate *L*, constructed as described for securing the bolt, substantially as and for the purposes specified.

Also, the location and arrangement of the spring *G*, upon the shifting lever and in relation to the shifting gear, substantially as and for the purposes described.

65,387.—WILLIAM W. HUBBELL, Philadelphia, Pa.—*Desulphurizing Ores and Extracting Gold and Silver.*—June 4, 1867.—The ore is pulverized, saturated with a solution of saltpeter, mixed with charcoal, and burnt. The heat leaves the ore desiccated and desulphurized. Ashes are removed by water; the remainder is amalgamated by quicksilver.

Claim.—Saturating the pulverized gold or silver ore with saltpeter, and uniting it with charcoal or carbon in other form, and applying fire to desulphurize and desiccate the ore, to extract the precious metal, substantially as described.

65,388.—HENRY JACKSON, Brooklyn, N. Y.—*Padlock.*—June 4, 1867.—The tumblers are attached to the sliding bolt. The spring on the guard drives it toward the serrated edges of the tumblers, and it catches upon them before they reach the stump, when the plate is pressed in that direction by the tentative picking process. The spring arm holds back the bolt when unlocked and is released therefrom as the shackle enters the case.

Claim.—First, the guard *E*, in combination with the tumblers *E* and plate *C*, all arranged to operate in the manner substantially as and for the purpose set forth.

Second, the arm *F*, in combination with the bolt *D*, arranged to operate in the manner substantially as and for the purpose specified.

65,389.—GUSTAVUS A. JASPER, Charlestown, Mass.—*Retort for Revivifying Bone Charcoal.*—June 4, 1867.—The foot of the upper section is contracted

and has ears by which it is bolted to the correspondingly-shaped upper end of the section below.

Claim.—The improvement in the construction of either or both of the two retort sections *A' B'*, as described, in order that they may be connected by screw bolts or screws and nuts, as set forth, and the upper section *A'* be rendered capable of being inserted into and withdrawn from the support plates *c d*, as explained, each section under such improvement being contracted or made with a neck *h* and provided with ears *e e*, or their equivalents, substantially as specified.

65,390.—GILBERT JESSUP, Shortsville, N. Y.—*Plaster Sifter.*—June 4, 1867.—The hopper is suspended between the wheels. The stirrer is suspended by straps to the front and rear sides of the hopper alternately; the parts are actuated by a pivoted yoke and a zigzag cam on one of the driving wheels. The gauge plate determines the size of the delivery openings.

Claim.—First, effecting a parallel adjustment of the delivery or discharge plate *G* by means of the bent or anchor levers *h j k*, as set forth.

Second, hanging the hopper *T* down between the carrier wheels, whereby it is balanced, or nearly so, upon the said wheels, substantially in the manner and for the purposes herein shown and described.

Third, the combination with the vibrating feed bar *D* having a serrated edge, the agitators *s*, when their lower ends are connected loosely to the said bar *D*, and the upper end of each alternate one is pivoted to the front side of the box *T*, and the others to the rear, as shown and for the purpose specified.

65,391.—JESSE JOHNSON, West Fallowfield township, Pa.—*Bolt Cutter.*—June 4, 1867.—The stationary and the movable knife are included between two plates, and the sliding knife is moved by its double rack and the segment gear of the two levers.

Claim.—The combination of knives *A* and *B* with levers *E* and *F*, screw *D*, frame *C*, and top and bottom plates, as in Figs. 3 and 4, all constructed, arranged, and employed in the manner and for the purpose shown and explained.

65,392.—WILLIAM KEISER, Stroudsburg, Pa.—*Grate.*—June 4, 1867.—The grate is made in two parts and each is operated from the outside of the stove. In dumping, the two parts move together when the rod is drawn. In shaking, the upper part moves on the under as the lever is reciprocated.

Claim.—The arrangement and combination of the parts *B* and *C* with the frame *A*, substantially as described; also the straps *d* and the wrench *D* with the pins *h n'*, as and for the purposes set forth.

65,393.—HENRY KELLOGG, New Haven, Conn.—*Machine for Making Paper Hats.*—June 4, 1867.—The article is formed of fiber suspended in water and deposited on the inner surface of a pervious "former," through which the water penetrates as the piston carrying the "former" rises. The pulp collected on the tip of the hat comes in contact with the elastic couching pad, which yields and extends its pressure toward the band; the annular pad couches the brim, and additional pressure consolidates the fibers. The hat is released by the resistance of the air in the cylinder on depression of the piston.

Claim.—First, the combination of the annular piston carrying the pervious former with the cylinder, and the means described, or the equivalent thereof, for controlling the water, substantially as and for the purposes described.

Second, the combination of the elastic couching pad, the annular piston carrying the pervious former and the cylinder, substantially as and for the purpose specified.

Third, the combination of the elastic couching pad, the annular piston carrying the pervious former, the cylinder, and the means for stopping the couching pad to compress the fibers, substantially as and for the purpose specified.

Fourth, the combination of the elastic couching pad, the couching annulus, the annular piston carrying the pervious former, and the cylinder, substantially as and for the purpose specified.

Fifth, the combination of the means for automatically controlling the water in the cylinder, of raising

and lowering the annular piston carrying the pervious former, and the cylinder, substantially as and for the purpose specified.

And finally, the combination of the cylinder, the annular piston carrying the pervious former, the elastic couching pad, and the means for stopping the upward movement of the couching pad, substantially as and for the purpose specified.

65,394.—TIMOTHY KENNEDY, Hamden, Conn., assignor to THOMAS KENNEDY, Branford, Conn.—*Machine for Turning the Heads of Screws.*—June 4, 1867.—The arc-shaped cutter occupies a slot in the holder, eccentric to the center of motion of its shaft, and is moved by a cam on another shaft so as to shave the head of the screw which protrudes from the tube on the standard.

Claim.—First, the combination of the cutter holder B with the cutter E' and the cam F, constructed and arranged so as to operate substantially in the manner herein set forth.

Second, the combination of the segmental cutter E, having its cutting edge formed as described, with the holder B, said holder being arranged to move the said cutter around a central point into cutting position, substantially as herein set forth.

65,395.—THEODORE E. KING, Painesville, Ohio.—*Spring for Holding Cloth in Sewing Machines.*—June 4, 1867.—The steel strip has teeth on the end which are pressed into the folded, or two thicknesses of cloth, to hold the fabric straight while sewing that length.

Claim.—The tension spring constructed substantially as set forth, for the purpose described.

65,396.—GEORGE V. B. LADD, Boston, Mass.—*Skate.*—June 4, 1867.—The runners are pivoted within slots in the pedestals below the sole, and have a certain freedom of motion therein, in a vertical plane.

Claim.—First, the combination of the sectional runners, as specified, with the recessed projection, within which they are hinged or pivoted under the arrangement herein described, so that the rocking motion of the runners shall be limited and stopped at certain points of the said projection or shoulder, as set forth.

Second, the combination of the sectional runners and recessed projections, within which they are hinged, as described, with the elastic foot rest, substantially in the manner and for the purpose set forth.

65,397.—R. M. LAFFERTY, Three Rivers, Mich., assignor to himself and J. E. and J. P. PRUTZMAN.—*Combined Cover Lifter, Hammer, &c.*—June 4, 1867.—Explained by the claim and illustration.

Claim.—The combination of the screw-driver E, tack-drawer G, lifter H, hammer-head I, the corrugation J of the jaw F, engaging with the extension piece K, to form pinners, knife-sharpening plate L, in one implement, constructed as herein described.

65,398.—EMILE LAMM, New Orleans, La.—*Making Crystal Shred Gold for Dentists.*—June 4, 1867.—To 3 parts nitro-muriate of gold add 2 parts of water and 1 part sugar; evaporate and lift the shreds of gold from the bath with an india-rubber spoon; filter, wash, dry, and heat to a dull red in a crucible.

Claim.—The above process, or any other process substantially the same, as specified.

65,399.—EMILE LAMM, New Orleans, La.—*Preparing Gold for Filling Teeth.*—June 4, 1867.—To the nitro-muriate of gold add boiling water and gum-arabic, evaporate in a bath; the gum causes the nitrous acid to pass off in fumes, and the fibers of gold are removed by a spoon or glass rod.

Claim.—The use of all organic substances soluble in solutions of gold, with the exception of saccharine substances, for making crystallized fibrous gold by any process, substantially the same as that herein described for the purpose set forth.

65,400.—THOMAS LEESON, Sharon, Wis.—*Post Hole Auger.*—June 4, 1867.—The pitch of the spiral blade is adjustable by means of the set nuts.

Claim.—The combination of the spiral spring plate C and nuts D and E with each other and with the

shank A, substantially as herein shown and described for the purpose set forth.

65,401.—GEORGE H. LEITHEAD, East Birmingham, Penn.—*Medical Compound.*—June 4, 1867.—Composed of refined sugar, 8 lbs.; alcohol, 2 oz.; borax, 1 oz.; gum-arabic, 1 oz.; laudanum, $\frac{1}{2}$ oz., and soft water, 2 $\frac{1}{2}$ qts.

Claim.—A medical compound consisting of water, sugar, borax, gum-arabic, laudanum or morphia, or other similar opiate, with or without alcohol, about in the proportion named, and for the purposes set forth.

65,402.—VOLNEY LEONARD, Springfield, Penn.—*Beehive.*—June 4, 1867.—The hinged metallic plate is let down to close the apertures, or raised to form an alighting board for the upper portion of the hive. The moth trap consists of grooved and notched strips. The spare honey boxes do not admit the queen.

Claim.—First, the plate D applied to the hive B in relation with the holes g, as shown, in combination with the fastenings or pivoted notched plates j j, substantially as and for the purpose set forth.

Second, the moth-trap composed of the grooved and notched strips h applied to the hive, substantially as shown and described.

65,403.—H. W. LIBBEY, Cleveland, Ohio.—*Carriage Top Prop-rest.*—June 4, 1867.—Formed with a rectangular metallic socket and a cylindrical cover of rubber.

Claim.—The metallic sleeve A, and cushion B, combined as and for the purpose set forth.

65,404.—HENRY LIGHTY, Attica, Ind.—*Evaporator.*—June 4, 1867.—The series of pans are connected together at alternate ends by means of short troughs with strainers. The perforated skimmer drives the scum into the overflow passages.

Claim.—The skimmer G, when constructed and operated, substantially as herein described and for the purpose set forth.

65,405.—WM. LOWE, Bridgeport Conn.—*Steam Generator.*—June 4, 1867.—Explained by the claim and illustration.

Claim.—Constructing cylindrical boilers, commonly known as plain horizontal tubular or flue boilers, with one or more openings in the sides or bottom of said boilers which shall communicate with a combustion chamber inside of the boiler, and connected by tubes or flues with the back end of the boiler, through which the products of combustion are made to pass, substantially in the manner and for the purposes herein shown and described.

65,406.—R. C. LUDLOW, St. Louis, Mo.—*Sifter.*—June 4, 1867.—A flange around the inside of the bottom affords a support for the wire cloth and the hoop.

Claim.—The combination of the batten a, head c, top e, and the sieve h, substantially as and for the purposes herein described.

65,407.—JOHN LUSK, Jr., Eckford, Mich.—*Tourniquet Clamp.*—June 4, 1867.—The metallic tourniquet clamp is furnished with set-screws and a peculiar pair of lips or guides, to be used in castrating animals.

Claim.—The tourniquet clamps A, provided with the guide lips C, and operated by thumb screws B, substantially in the manner and for the purpose herein set forth.

65,408.—ROBERT MACKENZIE and JAMES COOPER, New York, N. Y.—*Fire Escape.*—June 4, 1867.—Explained by the claim and illustration.

Claim.—The fire escape consisting of the inclined track ropes C C, their upper ends secured to the cross-bar B of the window frame, their lower ends to the ground bar D, and forming tracks upon which the car E slides to the latter, being guided by the ears a a fitting around said track ropes, and operated by means of the hoisting tackle F G b, when all are constructed and arranged as described, for the purpose specified.

65,409.—CARLILE MASON, Chicago, Ill.—*Safety Valve for Steam Generator.*—June 4, 1867.—The safety valve has an additional lever connected with the valves proper, so that when any jar deranges the weight or takes it from the main lever, so much of it is transferred to the additional lever and the pressure on the valve maintained equal, notwithstanding the disturbance of the weight. When the valve is lifted by the steam the additional lever does not interfere with its action.

Claim.—First, the lever C, arranged substantially as and for the purposes specified.

Second, the weight supporter D E, provided with a spring k, substantially as specified.

Third, the catches i, when so constructed as to remain in position when the weight is elevated by the main lever, and to project when the weight is elevated from any external disturbance, substantially as specified.

Fourth, the arrangement of the spring k with the lever C, or their equivalents, so as to prevent the escape of steam whenever the weight is agitated from any cause, such arrangement being substantially as specified.

Fifth, the combination of the lever C and spring k with the lever B and weight F, substantially as specified.

Sixth, the combination of the lever C, rod or rods c, and lever B with the valve a, substantially as specified.

Seventh, the combination of the cylinder D and cap E with the spring k and rod h, substantially as set forth.

Eighth, the combination of the weight supporter D E, provided with a spring k and catches i, lever C, and rod c, with the lever B, cylinder A, valve a, and weight F, substantially as and for the purposes specified.

65,410.—WM. MATHEWS, Bridgeport, Conn., assignor to himself and L. W. EATON, same place.—*Ratchet Drill.*—June 4, 1867.—The winch is connected to the operating bevel wheel by two pawls, one of which engages a spur ratchet and the other a crown ratchet to allow rotation in either direction.

Claim.—The combination of the pawl F and dog H with the ratchet wheel G, when constructed and arranged to operate as herein described and shown.

65,411.—F. MCMANUS, Ellenburgh Center, N. Y.—*Axle for Wagons, &c.*—June 4, 1867.—The spindle of the axle is wound with wire, which comes in contact with the boxing of the hub.

Claim.—Winding the part of a wooden axle upon which the wheel revolves with metallic wire, substantially as herein shown and described and for the purpose set forth.

65,412.—WM. D. MENDENHALL, Farmington, Ill.—*Plow Share.*—June 4, 1867.—The mold board and share are a segment of a cylinder whose axis is parallel with the share edge.

Claim.—The method of forming or shaping any plow share or mold board, or both combined, with a concave surface of any desired radius and area extending from the breast c of the plow towards the opposite side d, or in a line parallel, or nearly so, to the cut of the share.

65,413.—S. S. MIDDLEBROOK, Sandy Hook, Conn.—*Felting Machine.*—June 4, 1867.—The frames carrying the endless aprons are reciprocated by pitmans and cranks, and belts on the crank wheels turn spur wheels actuating the lower rollers of the endless aprons.

Claim.—The combination of the endless aprons C C', reciprocating and revolving at different velocities, as and for the purpose described.

65,414.—HENRY F. MOORE and JAMES S. BLAISDELL, Medford, Mass., assignors to HENRY F. MOORE, same place.—*Hanging Wagon Seats.*—June 4, 1867.—The upper leaves of the hinges are secured beneath, and the under leaves to strips which are adjustable by pins on the edge of the wagon box: when in the forward position the seat may be folded over in front.

Claim.—So attaching the hinges C to the body and seat of the wagon that the seat will be allowed to

slide back and forth, substantially as and for the purpose described.

Also, in combination with the above, the pins h, or their equivalents, for locking the seat B in place, substantially as set forth.

65,415.—THOMAS MORRIS, McGregor, Iowa.—*Fence.*—June 4, 1867.—The ends of the panels are joined by entering the end rails of one between the upright slats of the next; notched braces protrude between the upper rails and stay the fence laterally.

Claim.—The panels A and braces C, constructed and combined with each other, substantially in the manner herein shown and described, and for the purpose set forth.

65,416.—M. A. MORTON and D. F. MORTON, Angola, N. Y.—*Fruit Gatherer.*—June 4, 1867.—At the end of the pole is a jaw and bag attached; another jaw is pivoted to the pole and actuated by a rod.

Claim.—A fruit picker, constructed and operating substantially as herein set forth.

65,417.—JOHN NEAL, Sheboygan, Wis.—*Churn.*—June 4, 1867.—The earthenware churn is set within a tub of tempered water; from the sides of the tub rise the standards which support the gearing, giving motion to the rotary vertical dasher.

Claim.—The combination of the earthenware vessel A and the metallic bearing posts H, substantially as set forth and shown, for the purpose of adapting revolving dashers operated by gearing to an earthenware churn.

Also, in combination with the dashers F, the stripper D, substantially as and for the purposes set forth.

Also, in combination with posts H and earthenware vessel A, the hinged cap h, constructed and operated substantially as set forth.

Also, connecting the bearing posts H to the earthenware vessel A by passing a shank of the post through a vertical hole in a suitable lug or projection and securing said shank by a screw nut, or its equivalent, substantially as set forth.

65,418.—A. F. W. NEYENBER, Philadelphia, Pa.—*Boiler Feeder.*—June 4, 1867.—The fall of water from the lower ends of the pipes allows the steam to enter the pipes and the floats to fall; this opens a passage for the steam to the doctor engine and sets it in motion, which continues until the water entering the tubes raises the floats and cuts off the steam from the said engine.

Claim.—First, the construction of the valve A, with reference to the orifice of pipe B, whereby the steam is allowed to flow through pipe B, for the purpose of blowing an alarm whistle attached to pipe C, and raising the piston D, substantially as set forth.

Second, the arrangement of valve A', piston D, lever E, support F, weight G, pipes H and I, substantially in the manner and for the purpose as described.

65,419.—WM. H. NOYES, Franklin, Pa.—*Pump.*—June 4, 1867.—The lower valve is reciprocated, the upper one is stationary and the pitman rod slides through it. The whole valve apparatus may be introduced or withdrawn by the pitman, a collar on the same pushing the upper valve box down to place.

Claim.—The pump herein described, constructed with the collar E', upon the plunger rod E, valved plunger C D, and a valve box G, adapted to be removed by the plunger C, and forced down into the converging pump barrel by the collar E', all substantially as and for the purposes herein specified.

65,420.—LEVERETT H. OLMSTEAD, Newark, N. J., assignor to WRIGHT & SMITH, same place.—*Tightening and Loosening Wheels on Shafts.*—June 4, 1867.—Radially sliding blocks in the shaft are driven out against the inside of the pulley hub, by the conical end of an axial screw pin.

Claim.—The combination and arrangement of the slide B, screw y and pin or block X, constructed and operating as described, for the purpose of tightening or loosening wheels on shafts, as set forth.

65,421.—P. PARADIS and R. REILLY, Rochester, N. Y.—*Center Plate for Stove Tops.*—June 4, 1867.—

The plates are divided, as stated, to prevent straining of the metal when expanded by heat.

Claim.—Dividing the center plates of cooking-stove tops transversely through the narrow portion and connecting them by loose or sliding joints, substantially in the manner and for the purpose herein shown and described.

65,422.—GARDNER R. PARKER, Worcester, Mass., assignor to DODGE & WELLINGTON, same place.—*Centering and Squaring Chuck.*—June 4, 1867.—Improvement on the patent of N. F. Newell, January 29, 1861. Two cutters are used for squaring up the end of the bar, whose inner corners support the drill. The drill is held in the slotted socket, whose segments are sprung together upon it by a set screw.

Claim.—The particular combination and relative arrangement of the head A, slotted thimble B, drill *a*, and cutters A', substantially as and for the purposes above described.

65,423.—W. F. PARKER, Meriden, Conn.—*Automatic Feeder of Bolt Blanks.*—June 4, 1867.—As the slide is reciprocated the shanks of the blanks drop into the slot and the blanks are carried out of the hopper down the incline.

Claim.—Beveling the upper and slotted end of the vertically moving bar, as described and shown, in order that the screw blanks may, by the force of gravity, slide off the end of said bar, substantially as set forth.

65,424.—THOMAS PATTERSON, New York, N. Y.—*Pump.*—June 4, 1867.—The oscillation of the piston draws the water alternately through each side opening and discharges it through the other. The piston is actuated by the segmental rack attached to a lever and engaging a spur wheel on the piston shaft.

Claim.—First, a pump having an oscillating piston I within the cylinder A, which cylinder is provided with a partition or abutment E, and connected with two channels *c* and *d*, all arranged substantially as described.

Second, the semi-cylindrical chambers *c d e* and *f*, provided with the valves *g h i* and *k*, and divided by means of a partition E, all substantially as set forth.

65,425.—CASSIUS C. PECK and FRANCIS E. ENGLEHART, New York, N. Y.—*Manufacture of Durogel.*—June 4, 1867.—Artificial ivory; composed of glue, sulphuric acid, bichromate of potash, and sulphide of calcium.

Claim.—First, the use of bichromate of potassa with the addition of mineral acids, such as sulphuric or sulphurous acid, and in combination with pentasulphide of calcium, or their respective equivalents, substantially as and for the purpose set forth.

Second, the use of chloride of lime in addition and combination with common glue, substantially as set forth.

65,426.—RUFUS PEET, Castile, N. Y.—*Subsoil Plow.*—June 4, 1867.—The share and wearing parts of the landside and sole are made detachable for removal.

Claim.—First, the combination of the parts E F G H with each other and with the upright D and standard B, said parts being constructed and arranged substantially in the form and manner herein shown and described and for the purposes set forth.

Second, forming a projection *d* upon the landside of the forward edge of the upright D, substantially as herein shown and described and for the purpose set forth.

65,427.—HENRY PITCHFORTH and WM. BENSON, Muscatine, Iowa.—*Machine for Destroying Potato Bugs.*—June 4, 1867.—The reel whips the bugs from the vines, and they are crushed between the rollers in the box beneath the hopper.

Claim.—First, the combination of the reel P, hopper O, and rollers K with each other, substantially as herein shown and described and for the purpose set forth.

Second, operating the rollers K, from the drive wheel C, by means of the gear wheels E F N M L, substantially as herein shown and described.

Third, operating the reel P, from the rollers K, by means of the band R and pulleys S and T, substantially as herein shown and described.

65,428.—WM. H. POLLARD, Seneca Falls, N. Y., assignor to JAMES H. GOULD, same place.—*Axle Box.*—June 4, 1867.—The box has circumferential corrugations at each end and serrated leathers at the larger end, all to give firm bearing to the hub.

Claim.—The box A, provided with the corrugations *a a*, operating in connection with the hub, as herein set forth.

65,429.—FREDERICK B. PORTER, Detroit, Mich.—*Telegraph Signal Key.*—June 4, 1867.—An additional point of metal is placed above the key, similar, and connected similarly to the ordinary one beneath, so that the key can be worked in both directions, usually alternately, beginning, generally, with a downward movement after each pause.

Claim.—First, the supplemental point, or its equivalent, for the completion of the circuit O, connected, arranged, and operating substantially in the manner and for the purpose described.

Second, the additional spring, or its equivalent, R, arranged, and operating substantially in the manner and for the purpose described, in combination with the above.

65,430.—G. W. PUTNAM, Peterboro', N. Y.—*Dredging Box.*—June 4, 1867.—The box has a transverse partition containing a valve, and has side perforations.

Claim.—The sprinkle, consisting of the vessel A, having valve E and cross partition D, forming compartments B C, substantially as described.

65,431.—WM. H. RAGAN, Fillmore, Indiana, assignor to himself and N. R. JONES, Terre Haute, Ind.—*Cheese Press.*—June 4, 1867.—The screw is socketed in the follower and rotated by a fixed spur wheel, which engages the elongated pinion. The platforms rest on horizontal rails, on an inclined bed, having rollers resting on the latter during part of their movement towards the press.

Claim.—First, the arrangement of the vertical screw C in the frame A, in combination with the elongated pinion *p*, actuating it by means of the spur wheel *p'*, substantially as and for the purpose herein specified.

Second, the inclined bed E, provided with level rails *d d*, in combination with the platform *h*, arranged and operating substantially as and for the purposes set forth.

65,432.—JOHN RALSTON, Slippery Rock, Pa.—*Sheep Shears.*—June 4, 1867.—One of the arms carries a three-pointed cutter and the other is pivoted to and actuates the pivoted-cutter blade.

Claim.—First, the cutter C, when pivoted to the face of the cutter A and secured to the spring B, substantially as and for the purpose herein shown and described.

Second, the stationary notched bar A, when secured to the spring B, in combination with the movable cutter C, which is pivoted to the plate A and secured to the slotted end *e* of the opening B, all as set forth.

65,433.—WM. H. RANNELS, Oakland Mills, Pa.—*Harness Pad Block.*—June 4, 1867.—The pad leather is placed on the form, and the presser brought down upon its edges and clamped in place by the hinged link.

Claim.—The bow presser B, having its legs curved outwards and hinged to oblique staples *g g*, in combination with the block A, when constructed as herein specified.

65,434.—J. C. RICHARDSON, Benton, Maine, assignor to himself and WM. SIMPSON, same place.—*Potato Digger.*—June 4, 1867.—The machine is drawn across the rows, and when the digger teeth are inserted beneath the potatoes the axle is thrown around by the hand lever, to deposit the potatoes and earth upon the screen—an attendant raking the former into a box, the latter falling through the screen.

Claim.—First, attaching the teeth D of the digger

directly to the axle A of the machine, substantially as herein shown and described.

Second, operating the digger to lift the potatoes from the ground by means of the lever J attached to the axle A, substantially as herein shown and described.

Third, the combination of the screen G and receiving box H with the axle A and teeth D, substantially as herein shown and described and for the purposes set forth.

65,435.—F. RICHTER, Milwaukee, Wis.—*Pump*.—June 4, 1867.—The valve box is upon the side of the cylinder and contains an air chamber. The pump is double acting, the two pairs of valves being so arranged that while one end of the cylinder is filling the other is discharging, and *vice versa*.

Claim.—The arrangement of cylinder B, plunger L, valve chest C, and valves H with the water passages and air chamber K, as described.

65,436.—JOHN L. RILE, New York, N. Y., assignor to ASA L. SHIPMAN, same place.—*Paper for the Manufacture of Letter and Invoice Files*.—June 4, 1867.—The paper is prepared by coating one-half of each surface with mucilage in narrow strips. The coated strips on one side come opposite to the bare strips on the other.

Claim.—The preparation of paper and other similar sheets in the manner substantially as described and for the purposes specified.

65,437.—HENRY F. ROBERTS, Fayette City, Pa.—*Steam Engine*.—June 4, 1867.—The steam is exhausted from the smaller cylinder into the larger one, and acts on the piston therein, both by pressure and condensation.

Claim.—The large steam cylinder D, furnished with a piston and piston rod, and with the pipes k and m for admitting and discharging water alternately at its opposite ends, in combination with a high-pressure steam cylinder A, when such cylinders are connected together by exhaust steam pipes ff', substantially as and for the purposes hereinbefore described.

65,438.—J. H. SARDAM, Wellington, Ohio.—*Feather Cleaning Machine*.—June 4, 1867.—The rotating cylinder has doors for ingress, and contains steam pipes which may communicate with the inside of the cylinder by valve ports. The steam passes through the tubular journals of the cylinder.

Claim.—First, the pipes E, provided with holes H and valve I, as arranged, in combination with the central pipe E' and chambers E P', for the purposes and in the manner as described.

Second, the chambers F F' and pipes E E', in combination with the cylinder A, pipes G and G', and faucet R, as and for the purpose set forth.

65,439.—J. W. SHIVELEY, New York, N. Y.—*Railway Chair*.—June 4, 1867.—Improvement on his patent, July 10, 1866. The web of the rail is transversely slotted to embrace a rib upon one of the cheek pieces. The said rib has tenons which traverse the other cheek piece transversely and are secured by keys. The upper flange of the rails is partially cut away, counterpart inner projections of the cheek pieces entering these cavities. The rail ends are scraped together.

Claim.—First, the recesses in the rail ends, in combination with a cheek bar which fits into said recesses, substantially as and for the purpose herein shown and described.

Second, the combination of the longitudinal rib f, its equivalent with the cheek bar, substantially as and for the purpose herein shown and described.

Third, making the cheek bars B and B, and central rib f, one piece, with the chair C, substantially as and for the purpose herein shown and described.

65,440.—NELSON SYLVESTER, Weymouth, Ohio.—*Horse and Cattle Poke*.—June 4, 1867.—The tongue is held to a forward inclination by the spring, but when pressed against the fence, swings downward and uncovers the spikes, which are otherwise hidden in the cross-piece.

Claim.—The spring E, plate F, and spikes e, in combination with tongue C, cross-piece D, pin b, and bow A, substantially as and for the purpose set forth.

65,441.—S. D. SIMMONS, Brooklyn, N. Y.—*Bread Cutter*.—June 4, 1867.—Improvement on his patent, July 25, 1865. The knife is attached to the pivot bar and has a draw cut on the loaf set to a gauge on the box cover. The slices fall into the open compartment.

Claim.—The box A, provided with two compartments b b', in combination with the knife B, having the bar D attached about at right angles with pivots e, at its end, to work in bearings f, and a slit or space e, allowed at the top of the box for the knife, as it is brought down to work into the compartment d', substantially as and for the purpose specified.

65,442.—THOMAS P. SINK, Fairton, N. J.—*Roller for boarding Oyster Dredges*.—June 4, 1867.—Explained by the claim and illustration.

Claim.—The right and left hand screw roller, as attached to the gunwale of an oyster boat, for the purpose of boarding an oyster dredge, as herein described.

65,443.—GEORGE SPRAGUE, Spring Hill, Kan.—*Machine for Marking Corn Ground*.—June 4, 1867.—Of the four marking wheels the outer ones are axled on hinged wings and may be thrown up by levers.

Claim.—First, the hinged side wings E E, with wheels B' B', on their outer ends, combined with the truck frame A, with wheels B B, and levers a a, arranged and operating substantially as and for the purpose described.

Second, the guide rod d, on the tongue D, and the measuring line e, in combination with the truck frame A, employed as herein described.

65,444.—ROBERT STUART, Elmira, N. Y.—*Engine Governor*.—June 4, 1867.—The governor weights are attached to the elliptic springs at midlength and operate by the longitudinal contraction of the springs to decrease the ports of the throttle valve.

Claim.—First, the elliptical springs E E, and hinges c c, when attached to cross heads C D, constructed and operating as described and for the purposes set forth.

Second, the weight balls G, operating in combination with axes o, and hinged springs E, substantially as and for the purposes described.

Third, the combination and arrangement of the hinged springs E E, and cross heads C D, hollow shaft B, and valve-rod A, constructed and operating as described, and for the purposes set forth.

65,445.—CURTIS R. STICKNEY, Hartford, Conn.—*Match Box and Candlestick Combined*.—June 4, 1867.—The matches and candle are carried in parallel cases, and the cover of the former is adapted to protect the wick.

Claim.—First, the combination of a match box and a self-acting candlestick, when formed of two parallel tubes, substantially as herein set forth.

Second, the combination of the tube e with the outside shell d, and the cover D, substantially as herein described and for the purpose set forth.

Third, the cover D, having a receptacle for the wick of the candle, substantially as herein described.

Fourth, the placing of the roughened surface E in such a position that one of the tubes shall serve as a guide for the match when passed over its surface, substantially as herein described.

65,446.—EDWIN D. STURDEVANT, Germantown, Ohio.—*Revolving Stand for Pictures*.—June 4, 1867.

—The revoluble frame has several stories, and its various panels afford frames for the display of pictures.

Claim.—First, the rotary frame g' g', pivoted in the manner described, when arranged upon revolving chambers, substantially as and for the purpose specified.

Second, the series of revolving chambers furnished with brackets h h, and arranged to exhibit two or more tiers of rotary double picture frames, substantially as and for the purpose specified.

65,447.—SEMAN TABER, St. Joseph, Mo.—*Lifting Jack*.—June 4, 1867.—The foot of the standard and the hook of the lifting bar are inserted beneath the rail; the latter is raised by depressing the lever, which is suspended by a link from a tooth on the

rack of the standard. Spring pawls engage the rack to maintain the position attained.

Claim.—The construction and arrangement of the pawls or dogs F I, springs G M and *t*, levers H, lifting hook D, bar B, and socket K in the handle L, substantially as described for the purpose specified.

65,448.—VERLIN G. TANSEY, Quincy, Ill.—*Fire Kindler.*—June 4, 1867.—The wick receives burning fluid from the reservoir and sponge and is lighted and placed under fuel to kindle it.

Claim.—An improved fire kindler, constructed and arranged substantially as herein shown and described and for the purposes set forth.

65,449.—ISAAC C. TATE, New London, Conn.—*Vise for Holding Wood.*—June 4, 1867.—The bulb on the stem of the vise is held in a socket whose portions are clamped upon it by a set screw. The vise has thus a universal motion within a given range, to present the work as required.

Claim.—The universal joint D, constructed as described, consisting of the shank A, arm B, to which the cup lever C is pivoted and adjusted by means of the set screw *b*, adapted to support and adjust the ball G in any desired position, substantially as described for the purpose specified.

65,450.—HENRY THOMPSON, Rockland, Me.—*Windlass for Vessels.*—June 4, 1867.—The chain as it comes on board passes over a roller which is supported on a standard and moved by one of the pawl cases to which it is attached, so as to push the coil away by a succession of impulses and prevent the overriding of the chain.

Claim.—The arrangement as well as the combination of the vibratory standard F and its roller *c*, or the equivalent thereof, with the windlass A and one of its pawl cases C C, so as to be operated by such pawl case, substantially in the manner and for the purpose as hereinbefore specified.

Also, the combination and arrangement of the vibratory standard F, its roller *c*, or the equivalent thereof, the stay G, and the connection bar *d*, as described, the whole to be applied to the deck and windlass of a vessel, and the pawl case of such windlass of a vessel, substantially as and for the purpose hereinbefore explained.

65,451.—THEODORE R. TIMBY, Saratoga Springs, N. Y.—*Ventilating Door.*—June 4, 1867.—Explained by the claim and illustration.

Claim.—Ventilating rooms by means of the holes *a* or slots *a'* at the top or bottom of doors, provided upon each side with beveled or hollowed-out deflectors B or B', immediately above the said holes and projecting over them, substantially as herein shown and described.

65,452.—WM. H. TOPHAM, New Haven, Conn., assignor to himself and PECK, BROTHERS & Co., same place.—*Motor Regulator and Register Attachment for Organs.*—June 4, 1867.—To operate the bellows by water-power. The valve is connected to stops by which the power is regulated by the organist. The rising top of the bellows is connected by toggle levers to the connecting rod of two bell cranks, to change their position and regulate the flow of water through the valve.

Claim.—First, the combination of the plates K K with the plug G and cylinder D of the valve, substantially in the manner and for the purpose herein set forth.

Second, in combination with the plug G and its spindle H and bearing I, the cap *h*, and the nut or nuts upon the spindle, substantially as and for the purpose set forth.

Third, the combination of a regulator valve with an organ register V, when constructed and arranged so as to operate substantially in the manner set forth.

Fourth, the combination of the rod W, the register V, and the rod R, with a regulator valve and the bellows, when constructed and arranged so that the register operates substantially as set forth.

65,453.—J. F. TROXEL, Bloomsville, Ohio.—*Steam Engine.*—June 4, 1867.—The headless cylinder has three pistons, the outer two of which are attached to the axial piston rod which is connected to one

arm of an oscillating lever. The other piston has two rods attached to a cross-head which is connected to the other arm of the oscillating lever, said lever being connected to the crank. The outer pistons move the slide valve by pins in the same which enter the cylinder through slots.

Claim.—First, the special arrangement of the pistons B B', rods C C', cross-head G, and links F, in combination with the lever D, link H, and crank wheel I, for the purpose and in the manner substantially as described.

Second, the sliding valve *a*, as arranged in combination with the pistons B B', and operated in the manner as and for the purpose herein substantially set forth.

65,454.—SAMUEL VANSTONE, Providence, R. I., assignor to himself and JOHN STUART, same place.—*Making Car Wheels.*—June 4, 1867.—The rim and web of the wheel are forged from wrought-iron, and the hub cast thereto.

Claim.—Constructing a car wheel by first forging or stamping the part B with the lugs C around the central hole *b*, and then casting the hub thereon, substantially as described.

65,455.—ENOCH WAITE, South Natick, Mass.—*Felting Machine.*—June 4, 1867.—The material is placed on a feed apron, passes between two fluted rollers to a card cylinder, and is then taken between two endless aprons over the series of tables, and beneath the longitudinally and transversely reciprocating platens. A circumferentially grooved roller rests upon the endless apron and card cylinder housing, to arrest flying filaments blown up by the said cylinder and transfer them to the card surface.

Claim.—The combination of the card cylinder, the feeding mechanism, the carrying aprons, and one or more felting tables, and the platen or platens thereof, working longitudinally of the machine, the whole being arranged substantially as described.

Also, the combination of the transversely-grooved roller N, the card cylinder, the carrying aprons, and one or more sets of felting beds or platens, arranged substantially and so as to operate as specified.

Also, the combination of one or more sets of felting platens and mechanism for moving them transversely to the sheet of felt, with one or more sets of such platens and their mechanism for moving them longitudinally of the sheet or felt, the whole being substantially as and for the purpose as hereinbefore described.

Also, the combination of the feeding mechanism, the card cylinder, the two endless aprons, the beds, and longitudinally and transversely-working platens, provided with machinery for operating them, substantially as described.

65,456.—ENOCH WAITE, Franklin, Mass., assignor to himself and THE ELLIOTT FELTING MILLS, same place.—*Machine for forming Bats for Felting Wadding, &c.*—June 4, 1867.—The mechanism of the endless apron, and that of the auxiliary carder are so connected that the transverse bat will be delivered fairly on the other. The doffer of the auxiliary carder has a portion of its circumference equal to the width of the endless apron, unclothed. The bat is taken from the doffer of the feed roller and carried to the transverse card-clothed bars of endless belts running at right angles to and over the endless apron. The bat is removed from the card bars by a frame which is automatically depressed upon it.

Claim.—The combination of the endless apron C, and the feeding drum I, of the auxiliary carding engine, by or with mechanism, whereby the speed of the said drum may be controlled by, or increased or diminished with, that of the apron, substantially as and for the purpose specified.

Also, the endless carrier and the striker made and arranged in manner and provided with mechanism for operating them as described.

Also, the application of the projections of the striker to their bars by hinges, or mechanical equivalents therefor, in order that the projections may vibrate or move relatively to the bars so as not to impede the motion of the carrier.

Also, the combination of the endless apron C, the feeding drum I, and the doffer H, by or with mechanism whereby the speeds of both the drum and doffer are

varied with that of the endless apron, the same being for the purposes or objects explained.

65,457.—ADAM WEBER, New York, N. Y.—*Kiln for reburning and purifying bone black.*—June 4, 1867.—For revivifying bone charcoal. The furnace is erected on iron pillars. The retorts are so arranged in relation to each other and the fire flues that the heat is retained in contact with the retorts until it escapes to the chambers under the drying floor. The retorts are suspended on hanging rods.

Claim.—First, the columns *A'*, having cast upon their upper ends the plates *s*, in combination with the angle plates *p p*, supporting the fire bricks *q q*, the bed plates *a a*, and ash pan *L*, substantially as described for the purpose specified.

Second, the arrangement of the inclined partitions *h h* between the single retorts *D D*, and cast upon them and between the fire spaces *k k* and *m m*, in the rear of said retorts, substantially as described for the purpose specified.

Third, the horizontal fire flues *K K'*, and dampers *n n*, in combination with the retorts, substantially as described for the purposes specified.

Fourth, the hanging rods *e*, extending in sections from front to rear under the coolers, and suspended from the plates *a*, by means of the hangers *d*, arranged to support a series of retorts, as herein set forth for the purpose specified.

Fifth, the suspended iron ash pan *L*, in combination with the furnace *C*, substantially as described for the purpose specified.

Sixth, the flanges *v*, cast upon the upper ends of the lower sections of the retorts *E*, arranged in such a manner as to form partitions between the upper retorts and lower retorts *E* and *E'*, substantially as described for the purpose specified.

65,458.—WENDELIN WEIS, St. Paul, Minn.—*Apparatus for the Manufacture of Vinegar.*—June 4, 1867.—Improvement on his patent, March 5, 1867. The vertical series of shelves incline alternately in contrary directions, having passages on their lower sides for the overflow of the liquid, over which the hot and cold air is passed. The sides of the case open for convenience of cleaning.

Claim.—The vinegar apparatus which is constructed so that the vinegar and the air pass in zigzag lines over and around shelves *B*, in opposite directions to each other, and which is provided with hot and cold air pipes, and with removable end boards or such that can be opened, all substantially as and for the purpose herein shown and described.

65,459.—ABEL WHITLOCK, Danbury, Conn.—*Lamp Burner.*—June 4, 1867.—The flexible band passes through a loop on one side of the burner, and is tightened by a screw on the other side. It rests upon a foot flange of the chimney to maintain the latter in position.

Claim.—The flexible strap *B*, in combination with the screw *F*, or its equivalent for the purpose set forth.

65,460.—JOHN B. WILLETT, West Meriden, Conn.—*Plate Lifter.*—June 4, 1867.—The hooked arms pass through holes in the head plate of the handle and their upper ends are attached to the spring lever whose depression by the thumb draws up and contracts the hooks upon the plate.

Claim.—The combination of the handle *A*, the lever *D*, and hooked arms *C*, three or more constructed and operating substantially in the manner as herein set forth.

65,461.—EDWARD F. WOODWARD, Brooklyn, N. Y.—*Coffee Pot.*—June 4, 1867.—Improvement on his patent, March 25, 1862. The percolator is for use in an ordinary coffee pot. The heated water ascends through the central conical tube and is discharged through the foraminous plate, upon the coffee, from whence it drains, and again follows the same course.

Claim.—The detached fountain percolator constructed as described, consisting of the taper metal tube *A*, upon the inverted cup *B*, and supporting the cylindrical cap *C*, with the perforated bottom, through which the taper tube *e* passes, tube *i*, cap *D*, with the perforated plate *g*, tube *E F*, branch tubes *h'*, cup top *F*, and cover *k*, combined and operating substantially as described for the purpose specified.

65,462.—CHARLES F. WORCH, New York, N. Y.—*Apparatus for Destroying Moths.*—June 4, 1867.—The air-tight receptacle has a heating compartment below and a heated compartment above in which the infested article is placed and kept heated to 120° F., for a few hours.

Claim.—First, an apparatus for destroying moths that is made and operated substantially as herein shown and described.

Second, the device for regulating the heat in the box *A*, consisting of the box *E*, pipes *G* and *H*, dampers *a* and *c*, and door *F*, all made and operating substantially as shown and described.

Third, the use of the air-tight boxes in which racks or shelves *B*, are arranged for holding furniture and clothing from which all the moisture is removed without an excessive heat.

65,463.—JOHN ASHCROFT, New York, N. Y.—*Steam Engine Lubricator.*—June 4, 1867.—The cap has an annular rib which is pressed to the rubber ring in the cup edge by the projection and screw of the cap which engage a shoulder of the cup.

Claim.—First, the lid, or cover *B*, constructed and operating in the manner substantially as shown and described, and for the purpose set forth.

Second, the combination of cover *B*, and cup *A* constructed, arranged and operating in the manner substantially as shown and described and for the purpose set forth.

65,464.—HENRY B. BARBER, Scott, N. Y.—*Press.*—June 4, 1867.—The ratchet bar is fixed and is engaged by two pawls which are attached to sliding plates of the follower. These plates are actuated by a lever and each pawl operates alternately as a holder and a mover. When fully depressed a transverse key may be driven above the follower when the sliding plate and lever may be withdrawn for use upon another press.

Claim.—The sliding plate *C*, with its pawls *a e*, and eccentric lever *D*, when used in combination with the rack bar *B*, and follower *D*, and frame, substantially in the manner and for the purpose set forth.

65,465.—JOSHUA B. BARNES, Fort Wayne, Ind.—*Pipe and Stud Wrench.*—June 4, 1867.—The end of the handle has a serrated portion to form one jaw, in opposition to the pivoted jaw, whose position is maintained by a pawl engaging another serrated portion on the same end of the handle as the former.

Claim.—First, the handle *a* when the back portion of the upper end shall be provided with a rack, in combination with jaw *e* as and for the purpose specified.

Second, the pawl *d*, spring *e*, all combined and operated as and for the purpose described.

65,466.—E. E. BEAN and W. H. MUMLER, Boston, Mass., assignors to themselves and NATHANIEL CUMMINGS, same place.—*Lighting Gas by Electricity.*—June 4, 1867.—When the electric connection is made the rock shaft is vibrated, releasing the detent on the wheel, and also the escapement, allowing the train of clock gearing to rotate the gas cock 90°, turning the gas on or off as the case may be. The lighting wires are insulated by a non-conducting sleeve around the burner tip, and are connected to a separate circuit of wires by which the ignition is accomplished.

Claim.—First, in combination with the escape wheel *p*, the arm *n*, rock shaft *f*, and the detent *e*, when constructed and operated in the manner substantially as described.

Second, the non-conducting sleeve *H*, having the wires *l m* imbedded therein, in combination with the tip of the burner, substantially as described.

Third, imbedding the wires *l m* in a sleeve *H* of non-conducting material, surrounding the tip of the burner, or in the non-conducting tip of the burner itself, substantially as and for the purpose set forth.

65,467.—JOHN BELLERJEAN, Philadelphia, Pa.—*Lamp Chimney.*—June 4, 1867.—Explained by the claim and illustration.

Claim.—First, the metal chimney *E*, when supported by upright bars *D* and secured to an annular plate *C*, substantially as and for the purpose herein shown and described.

Second, a lamp chimney, consisting of the lower

glass or transparent chimney F and the upper metal chimney E, which are so arranged that the same do not come in direct contact with each other, substantially as herein shown and described.

Third, the glass chimney F in combination with the metal strips or bars D, arranged inside of the glass chimney, substantially as herein described, for the purpose specified.

65,468.—INNOCENT ANTONY BEGRATH, Nashville, Tenn.—*Toilet Powder.*—June 4, 1867.—The white clam or mussel shell is burnt and powdered for a cosmetic.

Claim.—The manufacture of this particular toilet powder, and from the material as herein set forth.

65,469.—VIRGIL W. BLANCHARD, Bridport, Vt.—*Stone Channelling Machine.*—June 4, 1867.—The frame is mounted on car wheels. The free end of its jointed section is supported by set screws engaging an arm pivoted to that section at the upper end and axled to a car wheel at the other. This section carries the rotating chisels and saws.

Claim.—First, the employment of a hinged frame when used substantially as and for the purpose set forth.

Second, the employment of one or more chisels, or one or more saws, to which a rotary motion is given for the purpose of channelling petrous substances, when attached to a hinged frame, substantially as described.

Third, the employment of a hinged frame to which are attached an elevating arm or arms and springs, as and for the purpose specified.

Fourth, the employment of a feed apparatus in combination with a hinged frame, substantially as and for the purpose described.

Fifth, the tooth rack L, on the track upon which the frame rests, in combination with said frame, substantially as set forth.

Sixth, the employment of the lever I, cog wheel H, when used as and for the purpose specified.

Seventh, in combination with the above the screw shaft E, substantially as and for the purpose set forth.

65,470.—P. BLOOMSBURG, Jr., and J. MOLYNEUX, Bordentown, N. J., assignors to BORDENTOWN MACHINE COMPANY.—*Rotary Valve for Steam Engines.*—June 4, 1867.—The valve has three disks. The inner one is actuated by the stem, and directs the passage of steam to and from the cylinder. The intermediate disk is fixed. The outer disk is fixed to a sleeve on the stem, and connected thereto by a pin that traverses a spiral groove in the sleeve. The longitudinal movement of the stem by adjusting collar, or governor, changes the relative position of the two outer disks and regulates the cut-off.

Claim.—First, a rotary valve composed of the disk F, with its passage *f* and opening *h*, and the disk D, with its opening *l*, in combination with the within described ports in the valve face of the cylinder, and the intermediate disk E, with its openings *j* and *j'*, the whole being constructed and operating substantially as and for the purpose herein set forth.

Second, the disk F and spindle G, with its vertical slot *g*, in combination with the disk D, the tubular spindle H and its spiral slot, and the adjustable collar I, the whole being arranged for altering the relative positions of the said disks, substantially as set forth.

65,471.—WM. F. BROWNE, Washington, D. C.—*Apparatus for Stacking Hay and Grain.*—June 4, 1867.—The haystack is built upon an elevated platform, which furnishes shelter for stock. The mast, crane and ladder, and incidents of the stack-building are explained by the claim and illustration.

Claim.—The combination and arrangement of the sheltering platform, the mast with its elevating crane, and the ladder for ascending the mast or stack, substantially as and for the purposes herein specified.

65,472.—R. W. CARPENTER, Brattleboro', Vt.—*Tremolo Attachment for Melodeons, &c.*—June 4, 1867.—The rotary valve of cut-off form is arranged within the main swell, is applicable to blast or suction, and is set in motion by a tremolo stop worked by a wheel and air blast.

Claim.—The attachment to a melodeon or other wind instrument of like character of a rotary tremolo

valve or swell, constructed to form an intermittent cut-off to the current and arranged to control the same in its action on the reeds, substantially as specified.

65,473.—THOS. J. CHUBB, Brooklyn, N. Y.—*Making Steel Direct from Ore.*—June 4, 1867.—Fully explained by the claims.

Claim.—First, treating purified iron sands or mechanically purified ore, by preparing, mixing, forming, or packing it into lumps, balls, or cylinders, and afterwards deoxidizing, carbonizing, melting, casting, and hammering or rolling the same at one, or continuous though varying, heat, substantially as described.

Second, the combination of the furnace A with the melting pot or chamber A', constructed and arranged for deoxidizing, carbonizing, converting, and melting iron ore into steel or metal having some of the properties of steel, substantially as described.

Third, preparing, mixing, and forming iron ore into lumps, balls, or cylinders, and packing the same into casings made of clay, cast or sheet iron, or any suitable material, for the purpose or purposes specified and substantially as described.

Fourth, the employment of a long, narrow, nearly horizontal or slightly inclined chamber A, so constructed that ore in the form of lumps, balls, or cylinders may be fed in at one end of the said chamber or furnace and discharged at the hollow end in the form of steel sponge, chemically changed as to the volatile matter combined with or contained in the said ore or metal, substantially as described.

Fifth, the employment of a long, narrow chamber A, so constructed that it may be opened or closed at either end by gates, or their equivalents, for the admission of the substances to be melted or converted into cast steel or similar metal, and for the admission and discharge of air and gases, and for manipulating with bars or otherwise the substances under treatment therein, said chambers being also provided with a tap hole and suitable movable partitions, or their equivalents, substantially as described.

Sixth, the arrangement of a mold chamber H, in combination with a melting chamber A', substantially as and for the purposes described.

Seventh, converting purified iron sands or mechanically purified iron ore into steel sponge or into a deoxidized spongy mass, by aid of a gas or gases arising from a gas generator when the same is passed through a reheating operation, substantially as described.

Eighth, the combination of a gas-generating furnace or apparatus, or passage leading therefrom, a gas and air heating or a heat reclaiming or regenerative furnace and apparatus with a chamber or chambers employed for chemically changing the volatile matter combined with iron ore or iron sponge, substantially as described.

Ninth, the combination of a gas-generating furnace or passage leading therefrom and a reheating or regenerating furnace and apparatus with a mold chamber H, for the purpose of heating or reheating this chamber, the mold or ingot or casting therein, for the purpose or purposes specified and substantially as described.

Tenth, the employment of intensely heated molds for casting ingots therein, when employed for retaining the heat in the castings preparatory to and for hammering or rolling the same, substantially as described.

Eleventh, the employment in a heated mold, while casting or pouring the melted metal therein, of gas or gases for excluding the atmospheric air therefrom, substantially as described.

Twelfth, the combination of a gas-generating furnace or apparatus operated in connection with a gas and air-heating or a heat-regenerating apparatus with a deoxidizing and carbonizing furnace or chamber for the purpose of heating the same, substantially as described.

Thirteenth, the combination of a gas-generating furnace operating in connection with a gas and air-heating or a heat-regenerating apparatus with a deoxidizing and carbonizing furnace or chamber, for the purpose of heating the same, substantially as described.

Fourteenth, the combination of a gas-generating furnace operating in connection with a gas and air-heating or regenerating apparatus with a melting

chamber, furnace, or pot employed for melting or reducing steel sponge and deoxidized sponge or carburet of iron in the form of sponge into cast steel, or metal similar to or having some of the properties of cast steel, substantially as described.

Fifteenth, the combination of a gas-generating furnace or apparatus, or passage leading therefrom, with a stationary chamber for deoxidizing magnetic proto or peroxide of iron containing or not the oxide of titanium or other metal or refractory matter.

Sixteenth, the combination of a gas-generating furnace or apparatus, or the passage leading therefrom, with a stationary chamber for reducing, heating, or melting of deoxidized sponge or ore in the form of sponge.

Seventeenth, the combination of a gas-generating furnace or apparatus, or passage leading therefrom, with a chamber for heating molds or the castings in the chamber in which they are formed.

Eighteenth, the combination of a gas-generating furnace or apparatus, or passage leading therefrom, with reheating tubes, or a chamber containing heated tubes, constructed for and applied to the deoxidizing, heating, melting, or reduction of ores or metallic substances containing iron and in the form of sponge, before, during, or after such treatment or treatments, substantially as described.

Nineteenth, the employment of a heat-reclaiming or a heat-regenerative furnace or apparatus, in combination with a chamber employed for heating a vessel or crucible containing iron ore or metallic sponge, converting, cementing, and melting the same into steel.

Twentieth, the combination of a heat-reclaiming or heat-regenerative furnace, or apparatus with a stationary vessel or chamber or chambers, employed for converting, melting, and cementing steel or metallic substances into steel.

Twenty-first, the immersion of steel sponge or carburet of iron sponge into a bath of molten steel, or metal similar in nature or quality to the sponge, so that the sponge may be melted and also a homogeneous liquid mass formed of it and the metal constituting the bath, substantially as described.

65,474.—DANIEL C. COLBY, Washington, D. C.—*Coffee Can and Crusher.*—June 4, 1867.—The coffee mill forms a base for the canister above and is charged therefrom.

Claim.—Combining with a coffee canister a grinding or crushing device of any desired structure, substantially as described and set forth.

65,475.—WM. DAVIS, Portland, Me.—*Beverage.*—June 4, 1867.—Composed of water, 1 gall.; sugar, 7 lbs.; essence of lemon, 64 oz.; citric acid solution, 1 oz.; tincture of ginger, 1 oz.; carbonate of magnesia, 2 oz. Fill into bottles containing 2 oz. simple sirup and charge with carbonic acid.

Claim.—The compound of ingredients herein specified, for a beverage, as set forth.

65,476.—FREDERICK W. DEVOE, New York, N. Y.—*Can and Box for Paints, &c.*—June 4, 1867.—The external groove forms a seat for the gasket, which is pressed by the rim of the can against the external bead.

Claim.—The groove *a*, external rib *b*, and gasket *c*, arranged in relation with each other and with the upper part *a'* of the body *A*, and the rim *b'* of the cover, substantially as herein set forth for the purpose specified.

65,477.—JAMES F. DRUMMOND, New York, N. Y.—*Can or Box for Holding Paints, &c.*—June 4, 1867.—The can has protruding and intruding circumferential beads. The rim of the cover fits down over the latter and forms an air-tight closure; being cut around at that level it subsequently forms a lid.

Claim.—First, the circumferential groove *a*, in combination with the overlapping rim *d* of the cover, and the soldered joint *a'*, substantially as herein set forth for the purpose specified.

Second, the external circumferential rib *b*, arranged with reference to the groove *a*, rim *d*, and soldered joint *a'*, substantially as herein set forth for the purpose specified.

65,478.—WM. H. ELLIOT, New York, N. Y., assignor to LOWELL L. JOHNSON, Binghamton, N. Y.—*Hay Loader.*—June 4, 1867.—The belt is run by power derived from the ground wheel, and the weight throws the windlass drum into action to lift the fork and its load.

Claim.—First, the combination of the swinging frame *g*, or its equivalent, a lifting rope *m*, and an elevating fork, so arranged that the loaded fork will operate the frame to produce the necessary friction to raise the load while said frame will drop, and the elevating mechanism cease to act, when the fork is unloaded.

Second, the combination of the lifting rope *m*, swinging frame *g*, pulley *h*, belt *k*, and tightening pulley *l*, arranged and operating substantially as described.

Third, the stop *m'* upon the rope *m*, in combination with ring *n'* and swinging frame *g*, for the purpose of decreasing the friction at the proper moment, so as to hold the fork suspended, as set forth.

Fourth, constructing a tripping fork so that it may be released for the discharge of the load by simply turning its handle and pressing against the same.

Fifth, the combination of the spring catch *r*, head *p*, and handle of the fork, substantially as and for the purpose set forth.

65,479.—HENRY FEYH, Columbus, Ohio, assignor to himself, GEORGE T. EMERY and WM. B. HAWKES, same place.—*Steam Generator.*—June 4, 1867.—Improvements on his patents Nos. 60,496 and 60,870. The pipes are inclined upward and forward and connected in front by coupling pipes running rectangularly to them; the lower ends of the coupling pipes are exposed outside the fire front, and are stopped with screw-plugs. The lower ends of the main pipes extend outside the furnace and have coupling caps, by whose removal they are exposed for cleaning.

Claim.—First, the arrangement of inclined pipes or cylinders of different diameters or capacities, communicating as described, for the purpose of producing a forced circulation of water in all parts when exposed to the action of heat, substantially in the manner shown.

Second, the arrangement of pipes *G H* with pipes *D* and *E*, the ends of said pipes projecting outside of the furnace walls, substantially as and for the purpose described.

Third, the arrangement of ball couplings *J*, and pipes *G H*, said pipes being of different diameters and in communication with one another by means of the chamber on which the ball-joint seats for the pipes are formed, substantially as and for the purpose herein described.

Fourth, a steam superheater *A*, in conjunction with a steam generator operating upon the principle substantially as specified.

Fifth, a steam receiving chamber *B*, in combination with a series of pipes of different diameters connected together at their ends and arranged substantially as described.

Sixth, the combination of pipes *G* and *H* with pipes *D E*, substantially in the manner and for the purpose described.

65,480.—EDMOND THEODORE GAMERON, Paris, France.—*Machine for Hulling Rice.*—June 4, 1867.—The rice from the hopper passes between several pairs of rollers, in which a fluted metallic and a rubber-covered roller are placed oppositely to pull the rice, which passes between them. Below each pair is a suction spout, which draws in the hull and chaff, allowing the grain to descend by its superior gravity.

Claim.—First, the arrangement of the suction chamber *I* and its nozzles or passages *H*, with relation to the cylinders *C D F G*, for operation substantially as specified.

Second, the valve *N*, in combination with the chamber *I* for regulating the draft through the passages *H*, without varying the velocity of the fan or other devices producing the suction.

65,481.—HENRY C. GEE, New York, N. Y.—*Apparatus for Annealing Wire.*—June 4, 1867.—The rotating longitudinally grooved cylinder has an outer jacket to keep the wires in the grooves, and a pipe conveying gas to be burned within it. Stationary

fingers run in circumferential scores of the cylinder to remove the wires at a certain point.

Claim.—First, the fluted chamber cylinder A, with hollow journals B B, perforated pipe E and jacket C, all arranged and operating substantially in the manner and for the purpose set forth.

Second, in connection with the annular *i i* in the cylinder A, and the stationary fingers *c c*, substantially as and for the purpose herein described.

65,482.—HUGH M. GIBSON, Grand Rapids, Mich.—*Stump Extractor.*—June 4, 1867.—The windlass to which the chain is attached is rotated by two ratchet wheels and pawls, actuated by levers.

Claim.—First, the arms C C, lever A A, connecting bars B B and pawls O O, all being combined, arranged, and operating as and for the purpose specified.

Second, the roller D, hooks G G, ratchet wheels K K, pawls O O and arms C C, when all arranged and operated as and for the purpose described.

65,483.—J. E. GILLESPIE, Boston, Mass.—*Rotary Steam Engine.*—June 4, 1867.—The cylindrical case has an inner, eccentric, rotating cylinder, and three radial pistons, whose guide rings are concentric with the outer case, and keep the edges of the pistons in contact with the inner periphery of the latter.

Claim.—First, the combination of the sliding and revolving radial wings or pistons, and loose eccentric rings E for operation, together essentially as specified.

Second, the loose eccentric rings E, made adjustable from the exterior of the cylinder or case, substantially as herein set forth.

Third, the blocks *a* to the wings or pistons F, made adjustable from the outside of the cylinder or case, essentially as described.

65,484.—RICHARD A. GILPIN, Chester county, Pa.—*Construction of Piers, Docks, and Wharves.*—June 4, 1867.—The main piles are driven accurately in the line of the face of the wharf, the plates are slipped into the grooves on the sides of the piles, and the combing is put on. The earth from behind the face wall is excavated, and a concrete wall backing is added, to which the face wall is tied by bolts.

Claim.—The construction, arrangement, and combination of piles *a a*, plates *b b*, ties *d d* and walls *h h*, in the manner and for the purpose herein described.

65,485.—J. T. GREENWOOD, J. WILSON, Beloit, Wis.—*Soap for Cleaning and Polishing Wood, Metals, and other Materials.*—June 4, 1867.—Composed of equal parts of pulverized quartz, Roman cement and bar soap.

Claim.—A new article of manufacture—an improved soap for cleaning painted work and polishing metals, tin, gold, silver, and plated ware, composed of the ingredients herein stated in about the proportions specified for the purpose set forth.

65,486.—JOHN L. HEALD, Boston, Mass.—*Winch or Capstan.*—June 4, 1867.—To dispense with the services of an attendant to take up the slack of the rope, a roller is brought up against it to prevent its retraction.

Claim.—First, a roller L, when employed in connection with the drum C, of a winch or capstan, substantially as and for the purpose set forth.

Second, supporting the shaft of the roller L in sliding bearings *n*, operated by levers K, or their equivalents, substantially in the manner and for the purpose described.

Third, the internal gearing F, in combination with the pinion E on the crank shaft D for reducing the speed of the revolution of the drum C of the winch, as and for the purpose specified.

Fourth, in combination with the above the gears H I for insuring the simultaneous revolution of the shafts B J, substantially as set forth.

65,487.—LOUIS HOFFMAN and AUGUSTUS A. HOFFMAN, Buffalo, N. Y.—*Boot Heel.*—June 4, 1867.—The heel has a plate, with spurs, which penetrate the tap secured thereto by a screw.

Claim.—The connecting plate C, constructed and applied as described, and provided with the spurs *ff*, in combination with the screw *e* and reversible or

removable outer portion A of a heel, arranged and operating substantially in the manner and for the purpose set forth.

65,488.—JAMES C. JAY and JOSEPH YOUNCE, Wabash, Ind.—*Churn.*—June 4, 1867.—As the chair rocks, the feet of the rods are brought to the ground alternately and move the dasher in the churn.

Claim.—First, the devices for giving motion to the dasher in combination with the chair.

Second, utilizing and applying the power of the rocking-chair in motion, and its easy and convenient motion for the purpose of churning.

65,489.—LUCIUS JORDAN, Southington, Conn.—*Wrench.*—June 4, 1867.—The square through-bar has the stationary head; the movable one is sleeved thereon and operated by a screw collar.

Claim.—The arrangement of the bar A, sleeves D and E, nuts F and H, and handle G, the several parts being constructed and arranged in the manner and for the purpose herein specified.

65,490.—JOHN V. KARR, Goshen, Ind.—*Gas Chamber and Valve for Forges.*—June 4, 1867.—The valve is placed between the bellows and the tuyere of the forge. A blast of air opens the valve; the latter prevents the reflux of heated air toward the bellows.

Claim.—The box A, made of any suitable shape and provided with an inlet and outlet pipe and air opening E, when used with the valve D, constructed and applied as and for the purpose specified.

65,491.—F. C. LA RIVIERE, Minneapolis, Minn., assignor to LUCIAN D. NEWALL and MOSES E. GREELEY, same place.—*Machine for Cutting the Locks in Hoops for Barrels.*—June 4, 1867.—The hoop is placed on the inclined part of the plate; the knife frame is brought down by the treadle; during the motion a pin on the frame actuates the lever to clamp the hoop.

Claim.—The use of the lever E, when constructed and operated to automatically clamp the hoop while the knife cuts the lock, in the manner and for the purpose substantially as set forth.

65,492.—CHARLES D. LETHERBURG, Chester, Pa.—*Shoe.*—June 4, 1867.—The leather on each side of the side seams is left full so as to form a gore and admit the foot with ease. It is formed into a fold by the contracting strap when the gaiter is on.

Claim.—The within covering for the foot, consisting of the parts B and C and the flap D, when cut of two pieces of material arranged as described.

65,493.—B. F. LIVINGSTON, Chicago, Ill.—*Cooking Stove.*—June 4, 1867.—The openings into the stove are all in the top plate, some of them being hinged. The oven door is also in the stove top. The fire pot is removable. The stove shell is double, allowing water between the two walls.

Claim.—First, the openings to the grate and the oven, arranged in the top of the stove, substantially as and for the purpose set forth.

Second, the combination of the plates C F with standards H, forming a double oven door, as and for the purpose set forth.

Third, the arrangement and combination of the ash pan R, fire box Q, and draft flue P, with the door O, substantially as described and set forth.

65,494.—ROBERT M. LIVINGSTON, Mobile, Ala.—*Composition or Paste for Articles of Food.*—June 4, 1867.—Composed of cheese, 32; olive oil, 5; mustard, 2; salt, 1½; pepper-vinegar, 1; and pulverized biscuit, 8 parts.

Claim.—A cheese compound or paste, substantially as above described.

65,495.—ELISHA MATTESON, South Brooklyn, N. Y.—*Paddle Wheel.*—June 4, 1867.—The paddles are obliquely placed on their arms, are divided and nearly meet at a median line. Their length depends on their position in reference to the crank, the longest ones being submerged when the crank is in the most effective positions.

Claim.—The use of two sets or series of paddles inclining inward, and arranged to gather and discharge the water, while they are made of gradually increasing and decreasing length to correspond with

the increasing and decreasing power of the crank, substantially as herein specified.

65,496.—WILLIAM R. McCUTCHEON, Washington, Iowa.—*Churn*.—June 4, 1867.—The respective dashers are connected to the central and the sleeve shafts, which are rotated in opposite directions by the single master wheel.

Claim.—In churns where there are two shafts rotated in opposite directions, the wheel dasher having the inclined faces on the one shaft and below the perforated dasher, having its inclined faces on the other shaft, the two being operated as and for the purposes herein set forth.

65,497.—GEO. W. MCGILL, Washington, D. C.—*Spike*.—June 4, 1867.—Explained by the claim.

Claim.—A split spike having one prong longer and larger than the other, and the smaller and shorter prong so bevelled at its point that on being driven into the wood it will diverge and spread from the main prong so as to operate as a brace and barb, substantially as and for the purpose described.

65,498.—CHAS. D. MILLER, West Meriden, Conn., assignor to himself and C. H. WARNER, same place.—*Attaching Thills to Carriages*.—June 4, 1867.—The thill iron has a cross-bar which enters through the opening in the shackle and occupies a slot in the pivot bolt; being then rotated, the front bar of the shackle passes through the slot in the thill iron, and the bar pulls against the hook of the shackle.

Claim.—First, the combination and arrangement of the bar *b*, extending between the heads *E*, with the socket *C* and pivot *D*, each constructed with a slot their entire length to receive the bar *b*, and so as to operate substantially in the manner herein set forth.

Second, the arrangement of the groove *h* on the pivot *D*, and the pin *e'* in combination with the socket *C*, substantially as and for the purpose specified.

65,499.—JAMES MILLER, Ovid, Michigan.—*Bag Fastener*.—June 4, 1867.—One end of the string is tied to the disk, and the string, after passing around the neck of the bag, is rove through the holes in the disk and the end secured by a hook to the bag.

Claim.—The piece of sole leather or other substantial material *a*, the leather strings or other strong cords *B* and *b*, and the iron hook *c*, combined and arranged substantially as described.

65,500.—DANIEL NEEDHAM, Groton, Mass., assignor to himself, JESSE A. LOCKE, and C. M. HOVEY.—*Apparatus for Charging Soda Fountains*.—June 4, 1867.—One of the gas-producing agents is enclosed in a tube which is screwed into the casing of the fountain, and a valve raised to allow its discharge to the other agent, in solution within said casing.

Claim.—The tube *B*, or its equivalent, for containing one of the gas-producing ingredients, operated in the manner substantially as described, in combination with the casing *A* of a fountain for soda and mineral waters and other effervescing beverages, substantially as set forth.

65,501.—W. NELSON, New York, N. Y.—*Machinery for Forming Molds for Stereotype or Electrotype Plates*.—June 4, 1867.—Impressions in a surface of soft material are made by types successively presented and impressed by keys struck by the compositor. The surface of soft material is moved progressively, and to the extent required for the reception of each type. The type are carried by a wheel, which is moved as required and stopped by pressure on a key, so that the corresponding type is brought into position to be impressed.

Claim.—First, communicating motion to the lever that impresses the types by an end motion of the pulley *9*, when the cylinder *e* is stopped, substantially as set forth.

Second, the lever *h*, incline *i*, and sliding pulleys *9*, in combination with the key barrel *l*, substantially as set forth.

Third, the projection *19*, swinging frame *20*, with diagonal cam *21*, actuating the lever *p*, in combination with the spacing block *g*, the parts being arranged and acting substantially as set forth.

Fourth, the auxiliary carriage *l'*, in combination

with the beds *k* and *l*, and levers *31* and table *m*, substantially as and for the purposes set forth.

Fifth, the scale boards *36*, keys *35*, and levers *31*, in combination with the auxiliary carriage *l'*, as and for the purposes set forth.

65,502.—JOHN W. POST, Castile, N. Y.—*Skate*.—June 4, 1867.—The screw shanks enter slots in the back edges of plates fixed to the heel and sole, the heads passing above the plates. The screws are kept in position by a spring which rises before the heel.

Claim.—First, the screw buttons *e' f' g'*, arranged substantially as and for the purposes described.

Second, the spring bar *i*, provided with a lug *h*, passing through a hole *e''* in the top part of the runner *B*, substantially as and for the purposes described.

Third, the combination of the spring bar *i*, provided with a lug *h*, with the screw buttons *e' f' g'* and plates *a'* and *d*, provided with slots *a'' b''*, and *c'*, substantially as and for the purpose described.

65,503.—JOSEPH M. PRUGGER, New York, N. Y.—*Button*.—June 4, 1867.—Explained by the claim.

Claim.—A button having a shank whose base *a* is concave, in the center of which is secured at an obtuse angle the wire coil *c*, whose convolutions are in the same plane with the base, whereby the button is uniformly supported while holding the cloth clamped in the concavity of the base, substantially as described.

65,504.—EDWARD F. PRYOR, Dayton, Ohio.—*Ice Crusher*.—June 4, 1867.—The ice chamber has a sliding floor, which is retracted to allow its discharge through the funnel at bottom. The top is hinged to the base, and its spring plunger has spikes which pass through the foraminous plate and traverse the ice chamber.

Claim.—The ice chamber *B*, when provided with the chambered cover or extension *A*, for containing the toothed plunger *D* and perforated diaphragm *F*, either with or without the hinge *C*, constructed substantially as described and set forth.

Second, the perforated diaphragm *F*, or its equivalent, when arranged for use in an ice crusher, substantially as and for the purposes specified.

65,505.—ANDREW RANKIN, New York, N. Y.—*Water Closet*.—June 4, 1867.—The disk discharges behind the partition, to which it is hinged, and is raised with the lid, before the partition is a receptacle to receive a deodorizing substance. The said receptacle has a perforated top to permit the escape of gases therefrom.

Claim.—The pan or dish *D* and perforated receptacle *E*, in combination with a water-closet bowl, all arranged together and operating substantially as and for the purpose described.

65,506.—JONAH L. REES, Peoria, Ill.—*Cog Gear- ing Spring*.—June 4, 1867.—The bevel wheel is on the shaft between a collar and a keyed hub, having arms inclined down between the arms of the bevel wheel and driving wheel, by rubber blocks impinging against the said arms. The arms are kept in position by screw bolts.

Claim.—The hub *D*, with its arms *E*, rubber spring *G*, adjusting bolt *I*, and tightening tap *L*, or their equivalent, in connection with the arms *F* of bevel wheel *A*, working in the manner and for the purpose specified.

65,507.—J. J. RIDDLE and W. S. GRAY, Pittsburgh, Pa.—*Petroleum Vapor Stove*.—June 4, 1867.—The petroleum is carried through a pipe coiled around the flame, where it is vaporized, the vapor passing to an adjustable discharge within a pipe covered by a foraminous plate, above which the gas is ignited. Water is brought to the flame by a pipe containing some capillary substance, and steam is furnished in fine jets. When the oil is heavy, water is mixed with it in small quantities by a pipe containing fibrous material.

Claim.—First, a coiled, curved, or other ordinary-shaped continuous conduit heater *P*, within the flame and of sufficient length to vaporize any of the different grades of petroleum oils, in combination with foraminous cap *E* and mixing chamber *H*, for the uses and purposes mentioned, substantially as described.

Second, the carrying of water from a vessel *R* into

the flame in chamber F, by means of tube W, filled with any ordinary capillary substance W, for the uses and purposes mentioned, substantially as described.

Third, the carrying of steam from a closed vessel C, by means of tube S, into the flame in chamber F, for the uses and purposes mentioned, substantially as described.

Fourth, the carrying of water into the cold oil from a vessel B by means of the capillary substance *d* and tube *h*, for the uses and purposes mentioned, substantially as described.

65,508.—AMOS C. RODGERS, Philadelphia, Pa.—*Sash Fastener.*—June 4, 1867.—The side of the sash is grooved and one side of the groove lined with metal to receive the impingement of a plate which is operated by a screw, whose head projects from the framing.

Claim.—A sliding frame or door B, with its plate *b* at the edge, in combination with a plate F and with screw D, whereby the plate F may be brought firmly against, or removed from contact with, the plate *b*, the whole being constructed and operating substantially as and for the purpose described.

65,509.—MATILDA C. ROOT and ELISHA COLT, Hartford, Conn., and HARRIS COLT, New York, N. Y., executors of E. K. ROOT, deceased.—*Revolving Fire Arm.*—June 4, 1867.—The breech piece is raised slightly to free it from its holding notch, and then slid back to expose the cartridge chamber, the extractor withdrawing the shell simultaneously. The needle slides in the breech piece and impinges against the cartridge near the flange edge. The seer spring has an upper arm engaging a dog which holds down the rear of the breech piece when the gun is charged. The hammer is enclosed in the lock, and the gun is cocked by a cock lever outside.

Claim.—First, the employment in construction with the open breech barrel and frame of a sliding breech piece, constructed and arranged to operate in the manner substantially as set forth.

Second, the extractor-shoe or piece, in combination with the sliding breech piece, and the frame in which both said parts work, arranged and operating substantially as set forth.

Third, the double-acting spring S, in combination with the seer R and catch bar T, the whole constructed to operate substantially as set forth.

Fourth, the hammer M, constructed as described, in combination with the sliding rod or bar *w* and check pin *n*, substantially as described, for the purpose set forth.

65,510.—MATILDA C. ROOT and ELISHA COLT, Hartford, Conn., and HARRIS COLT, New York city, executors of E. K. ROOT, deceased, assignors, as executors, to COLT'S PATENT FIRE-ARM COMPANY, Hartford, Conn.—*Revolving Fire-arm.*—June 4, 1867.—The cartridge cylinder is held in place by a pivoted front pin and a retractable base pin, which occupy an axial perforation through the said cylinder.

Claim.—First, the employment, in combination with a removable breech block or cylinder, of a vibratory base pin, substantially as and for the purpose set forth.

Second, the employment, in combination with a rotary base pin, of a cylinder bored through, when the whole is so constructed and arranged that the cylinder may be placed in the said base pin and engage therewith with either end forward, as and for the purpose set forth.

Third, the employment, in connection with the stock barrel and a swinging cylinder, of a frame A' of the shape substantially as described, so as to permit the removal and replacement of the cylinder, in the manner set forth.

65,511.—JAMES SANDERS, East Boston, Mass., assignor to himself and NOAH H. MARSTON, Boston, Mass.—*Steam Gauge Cock.*—June 4, 1867.—The conical plug is fitted to turn in a suitable bore of the shell, and has a discharge opening agreeing with the spout of the same.

Claim.—The hollow conical plug B, with its spindle C and opening *d*, in combination with the shell or casing A, the interior of which is of a tapering form, all arranged and operating substantially as and for the purpose set forth.

65,512.—THOS. SHEEHAN, Dunkirk, N. Y.—*Composition for Converting Iron into Steel.*—June 4, 1867.—The composition described in his patent, September 4, 1860, is saturated with carbonic acid gas. Lye is poured into the barrel in a small stream while the gas is passing from the retort.

Claim.—The saturation of the liquid combination described in my former patent with carbonic acid gas, substantially for the purpose set forth.

65,513.—G. W. SHINGLETON, Auburn, N. Y.—*Car Coupling.*—June 4, 1867.—The coupling link is held by a pin in one draw-head and its pivoted claw arms enter the other. They are dislodged from their engagement by the treadle, which acts upon two levers to press-in side springs of the draw-head for that purpose.

Claim.—First, the levers *k k*, in combination with the treadle B, operating substantially as and for the purpose set forth.

Second, the springs *n n*, when operated upon by levers *k k*, as and for the purpose specified.

Third, the pivoted connecting pin, when constructed and used substantially as and for the purpose described.

65,514.—TILMAN SHIVER, Newburgh, Ind.—*Lifting Jack.*—June 4, 1867.—The end of the vibrating bar is drawn so far back over the lever fulcrum as to render the device self-sustaining when in its raised position.

Claim.—The construction and arrangement of the laterally-vibrating bar C pivoted at its lower end to the part B and at its upper end to the lever G, which is pivoted to the part A of the jack, the said parts A and B being recessed as at *e d*, substantially as and for the purpose described.

65,515.—A. B. SPENCER, Rochester, N. Y.—*Filter for Pharmacists and Others.*—June 4, 1867.—The filter rests on a packing on the lip of the bottle. The air is withdrawn from this latter to increase the rate of filtering.

Claim.—First, in an atmospheric filter composed of the tunnel A, bottle or jar B, and air pump C, the employment of a packing *h* for the purpose of producing an air-tight joint between the tunnel and bottle, the whole combined and operating as herein set forth.

Second, the arrangement of the filtering medium *d d* with the removable perforated diaphragm *f*, when operating in connection with the shoulders *c c*, as herein set forth.

65,516.—BENJAMIN S. STOKES, Manchester, N. H.—*Furnace for Heating Articles of Steel in the Process of Tempering.*—June 4, 1867.—The muffle is of fire clay or iron and has a series of longitudinal cells to receive the articles to be tempered. The flue is over the front part of the furnace.

Claim.—The cellular muffle K, substantially as and for the purpose set forth.

Also, placing the flue C at or near the front of the furnace, for the purpose described.

Also, forming an air space *g* within the door F, substantially as and for the purpose set forth.

Also, the cellular muffle K, in combination with a furnace provided with a flue C and a double door F, constructed and operating substantially as described.

65,517.—J. B. SWEETLAND, Pontiac, Mich.—*Sawing Machine.*—June 4, 1867.—The circular saw is carried on a frame loosely pivoted to its driving pulley shaft, and may be swung around to bring it to act upon the wood in the trough. The drag pin is driven by a crank pin on the driving wheel, and a cam wheel on the same shaft has eccentric cam grooves operating the feed mechanism of the drag saw when the latter is raised.

Claim.—The arrangement of lever P with the cord S, box *d*, and pin *q*, and shaft M, for raising the saw and throwing the roller in gear to move the timber at the same operation, substantially as set forth.

65,518.—GEORGE L. WARNER, Rochester, N. Y., assignor to himself and CORNELIA HAWKS, same place.—*Railway Switch and Signal.*—June 4, 1867.—The switch lever has a cord connected to a transversely-sliding hanging signal; a weight keeps it taut. A transverse rock shaft has eccentric plates to

lock the rails in either position by the oscillation of a lever of the rock shaft.

Claim.—The combination and arrangement with the switch B C of the elevated and isolated signal L, connected by the cord *c* and provided with counter-balance weight *f*, operating in the manner and for the purpose specified.

Also, specially beating the cam shaft G in the ends of the shifting rails, and providing it with cams that couple the ends of the rails directly together, as herein set forth.

Also, the arrangement as a whole, consisting of the weighted signal L, cord *c*, switch B C, cam shaft and cams G *a*, and the standard frame I K, with guide B and screen *g*, as set forth.

65,519.—JAMES B. WEBB, Muscatine, Iowa.—*Farm Gate.*—June 4, 1867.—The upper journal of the gate passes through a pivoted head piece connected to a double crank bar in the track, over which the wheel of the vehicle passes; impact of the wheel changes the inclination of the hinge post and swings open the gate. A similar device on the other side closes the gate.

Claim.—The combination of the gate A, post B, adjustable head piece C with the rods and levers D E F and F' and double crank rods G and G', arranged to operate substantially in the manner and for the purpose set forth.

65,520.—GEORGE E. WHITMORE, Housatonic, Mass.—*Folding Chair.*—June 4, 1867.—The arms are attached to the side bars by straps whose slots permit their oscillation from an upright position when in use, to a position side by side when the chair is folded.

Claim.—The combination of the arm posts B, straps D, and headers A, with their stop pins and slots G, constructed and arranged in a folding chair, in the manner and for the purpose set forth.

65,521.—GEORGE E. WHITMORE, Housatonic, Mass.—*Hub for Wheels.*—June 4, 1867.—The inner flange is attached to the boxing, the outer one is sleeved thereon and tightened by a nut. The hub is clamped between the two to prevent splitting when the spokes are driven.

Claim.—The combination by which the wooden parts of the hub are encased and supported at both ends and on its periphery by the iron flanges, enabling the wheel makers to drive the spoke firmly into the smallest hub, and thus attaining the desired qualifications of elasticity and strength.

65,522.—A. T. WRIGHT, New Vienna, Ohio.—*Beehive.*—June 4, 1867.—The base chamber has a feed box and the place of entrance above this is a section containing the triangular comb-frames, and an upper section containing the rectangular frames having triangular upper bars.

Claim.—First, the honey-frames R and broad frames R', as constructed, when used in the manner herein specified, with the triangular strips *a*³, for closing the openings between the frame sections F F' as set forth.

Second, the combination and arrangement of the bars G, pieces K, and eccentrically-tenoned locks L with the frame sections and connecting boards X, as constructed, when used for the purposes set forth.

Third, the frame sections A, having a concavity *a*' at its top, slanting board *b*², and receptacle for feed box D, ventilating screens *h* and *e*, with door *b*, and adjustable bottom *c*¹ *c*², when constructed and arranged in the manner and for the purposes specified.

Fourth, providing the under part of the beehive stand with rubber bands *x*, or their equivalents, in the manner substantially as specified and for the purposes set forth.

Fifth, the feed box H, constructed as herein specified, having a lid with screen *v* and cleats on its under side for allowing a space between the said lid and box for the egress and ingress of the bees, as specified.

65,523.—WILLIAM W. WRIGHT and JOHN BOODY, Ellsworth, N. Y.—*Dolt Cutter.*—June 4, 1867.—The lower bar has a plate to which are pivoted the cam bar and upper jaw of the cutter. The latter is opened by a spring.

Claim.—The combination and arrangement of the

bars A and B, lever E, plates C and D, and spring F, constructed and operating in the manner and for the purpose specified.

65,524.—THOMAS YATES, Dubuque, Iowa.—*Heating Stove.*—June 4, 1867.—Used either as a heating drum or stove. For the former, there is a hole in the base plate with a collar to receive a stove pipe. When used as a stove this opening is closed. The caloric current passes into the annular chamber around the top, from whence it may, by dampers, be made to pass down the pipes of one side, across the base chamber, and up the pipes on the other side of the chimney.

Claim.—First, the arrangement of the open-top fire-chamber A in combination with the upper draft-chamber *f f*, so that the draft can be directed around the open-top fire-chamber A, as specified.

Second, the arrangement of the two dampers *g* and *h* in the upper draft-chamber *f f*, so that the draft can be changed in the different directions, as specified.

65,525.—P. M. ACKERMAN, Webster, N. Y.—*Ladder.*—June 11, 1867.—The hook by which the upper ladder is sustained from the rounds of the lower section is pivoted to a weighted tumbler, which, by striking the rounds of the lower section, raises the hook and permits it to pass in raising and lowering the upper section.

Claim.—First, the combination of the ladders A and B, the latter being provided with the flat windlass H and having the rope *b* arranged as shown and described.

Second, the hook D having the weighted tumbler E, provided with the pin or stop *o* pivoted to it, and arranged to strike the rounds of the ladder, and thereby raise the hook and let it pass the round both in ascending and descending, substantially as described.

Third, in combination with the ladders A and B and the flat windlass H, the ratchet *d* and pawl *e*, arranged as set forth.

65,526.—W. W. ANDREWS, J. CUMMER, J. F. GANWEILER, and JOST STENDEL, Croton, Mich.—*Fire Alarm.*—June 11, 1867.—Cords saturated with pitch are placed in various apartments, after passing out of which wires are substituted so as not to be severed by fires out of the special apartment of each. The different wires are conducted to one place and weighted to indicate the locality of a fire.

Claim.—First, the employment of cords B B, when said cords are saturated with some inflammable material, for the purpose of more effectually enabling them to be consumed or severed in case of fire, substantially as described.

Second, the employment of rods C C, in the manner specified, for the purpose of indicating the exact room or locality in which the fire originated, in combination with levers G and weights F F, substantially as described.

65,527.—GEORGE ASMUS, Houghton, Mich.—*Bottle Pump.*—June 11, 1867.—The elastic bulb drives air into the bottle and expels the liquid through the pipe and nozzle.

Claim.—A bottle pump, constructed and arranged substantially as described, as an article of manufacture.

65,528.—A. C. BACON, Cleveland, Ohio.—*Mop and Brush.*—June 11, 1867.—The scrubbing brush is clamped by its top and one edge between the frame and its finger, and by the other edge by the set screw. It is thus adapted to be used on the end of a long handle.

Claim.—First, the frame B, provided with the head B', fingers *b*, arms D C, screw E, and for the purpose substantially as set forth.

Second, the herein-described holder, in combination with the brush or mop, substantially as and for the purpose specified.

65,529.—EPHRAIM BALL, Jr., Canton, Ohio.—*Plow.*—June 11, 1867.—By the arrangement described the beam and handles remain unchanged, but the mold-board, point, and landside are shiftable, and may be all or either of steel or of iron.

Claim.—First, so conducting a metal plow beam

that the parts that are attached thereto can be made either of cast iron or steel, or of both, substantially in the manner herein specified.

Second, the combination of a steel mold-board, point, and landside with cast-iron plow beam, when said plow beam serves for the purpose of a support to the mold-board, point, and landside, and also for a plow beam, substantially in the manner herein specified.

Third, the brace K, and bar O, when used in connection with the plow beam A, substantially in the manner and for the purpose herein specified.

Fourth, the groove *t* in the plow beam A, when arranged in the manner and for the purpose herein specified.

Fifth, the dovetail at *h*, in the top of the groove *s*, when used in connection with the projections *n* on the landsides K and M, substantially in the manner and for the purpose herein specified.

Sixth, the attachment of the cutter P to the cast-iron plow beam A, in the grooves *a* in said beam, in the manner herein specified.

Seventh, the L-shaped block G in cast-iron point, when said point is used as a part of the cast-iron attachments, in the manner herein specified.

Eighth, the block H and I, the hooks L and N, constructed and arranged in the manner herein specified.

65,530.—JOSEPH B. BANCROFT, Hopedale, Mass.—*Lubricator for Spinning Machines.*—June 11, 1867.—The bracket has an annular oil chamber around the cylindrical sleeve, and the driving gear has a chamber similarly situated. The chambers are connected by a spiral groove on the sleeve, which is pierced with holes to lead the oil to the spindle.

Claim.—The combination and arrangement of the oil chambers *c d*, the groove *f*, and the hole or holes *e*, with the bracket D, the neck H', and the gear E, the whole being substantially as described.

65,531.—E. H. BARNEY and JOHN BERRY, Springfield, Mass.—*Skate.*—June 11, 1867.—Lips punched downward from the foot plate form guides for the clamp plates whose upturned ends clasp the sole of the boot. A collar on the clamping screw operates against a pin on the clamping plate to release the grasp.

Claim.—First, as a new article of manufacture, the pieces *f f*, when punched or upset from the foot plate A, in combination with the clamps *a* and *a'*, having beveled edges *h h*, all made substantially as herein described and for the purposes set forth.

Second, the pin *e*, when attached to the clamp *a*, and operating in the groove *e*, or against the collar *i*, on its outside, when made substantially as herein described and for the purpose herein set forth.

65,532.—SOLOMON E. BICKFORD and FREDERICK FLANDERS, Franklin, N. H.—*Graduated Bevel Square.*—June 11, 1867.—The two blades are pivoted together; one of them has an inner and outer scale, and the end of the other has indicator edges by which any required miter or bevel may be determined.

Claim.—The within-described bevel square, consisting of the blade A, with its inner and outer scales, and the blade B, with its indicators *e*, connected by the screw-pin *b* and nut C, or their equivalents, arranged and operating substantially as set forth.

65,533.—LEVERETT BISHOP, Paris, N. Y.—*Manufacture of Stopples for Bottles.*—June 11, 1867.—Artificial cork-wood is wrought into cylindrical pieces whose diameter is equal to the base of the conical stopple required. These are immersed in dilute sulphuric acid and compressed, to give them elasticity when coming in contact with liquid.

Claim.—The right to make and use in the fabrication of stopples for bottles a substance called lignine, or an approximation thereto; also light, porous, woody fiber, as both herein specified, by means of compression into molds or forms herein mentioned and described.

Also, compression as above only for the specific purpose of securing to such stopples the quality of rapid expansion by moisture, and somewhat of cork-like elasticity, and for giving them certain definite, artistic shapes.

65,534.—A. MCK. BLAIN, Deerfield, Va.—*Apple-paring, Coring, and Slicing Machine.*—June 11, 1867.—The apple is revolved on its shaft and pared by the knife which is applied by hand; is halved by the oscillating knife blade; is cored, and then cut into pieces by a knife with several blades.

Claim.—First, the coring blade L, shaft M, clutch pulley N, and bent spring P, in combination with the horizontal frame K, frame-work A, and prong shaft B, constructed and operating substantially as herein shown and described.

Second, the arrangement of the prong shaft B, halving knife H, coring knife L, and slicing blade T, with each other and with the frame A, when all are constructed and operating as herein described, and for the purpose specified.

65,535.—ALEXANDER BOUDROU, Philadelphia, Pa.—*Boot Blacking.*—June 11, 1867.—Composed of alcohol, 1 gall.; gum shellac, 2 lbs.; sweet oil, 20 drops; lampblack, 1 oz.; for boot blacking. Proportions varied for other purposes.

Claim.—The composition composed of the ingredients named, for blacking leather boots and other articles of leather, stoves and other articles of iron, and for coloring polished iron, substantially as described.

65,536.—R. BRAYTON, S. CURTIS, and DAVID JUNE, Fremont, Ohio.—*Steam Engine.*—June 11, 1867.—To change the engine from high pressure to low pressure, the link is hooked to the rock shaft, so as to throw up the puppet at the instant of exhaustion, and pass the steam to the condenser, thus diverting it from the outer exhaust pipe. Unhooking the link restores it to the high pressure.

Claim.—First, the cam *d*, yoke *e*, stem *b*, and valve *a*, as arranged in combination with the chamber P', valve *i*, and pipes O' and R, for the purpose and in the manner as herein described.

Second, the link K, rock shaft J, and link *e'*, as arranged in combination with the cam *d*, yoke *e*, stem *b*, and valve *a*, for the purpose and in the manner set forth.

65,537.—WM. D. BROWN, Milwaukee, Wis.—*Bottle Stopper and Coupling.*—June 11, 1867.—The coupling or stopper is made of rubber, and its extended elastic flange laps over the lip of the bottle.

Claim.—First, the bottle A, tube B, and coupling C, in combination, substantially as and for the purpose described.

Second, coupling C, when made with flange or flap D, as described.

Third, flexible stopple E, when made with flange or flap F, substantially as described.

65,538.—WM. BRUCKNER, San Francisco, Cal.—*Furnace for Desulphurizing Ores.*—June 11, 1867.—The inclined partition in the cylinder is of rhombal shape, and has obtuse ends; its office is to forward the roasting ore through the cylinder, the surfaces of each being lined with fire-resisting material.

Claim.—The inclined partition D, in the form of a deviating square, or any other shape, placed at any inclination or angle, to insure a constant passing around it of the material to be treated, said partition to be constructed of iron plates in sections or as a whole, and covered with fire-proof material, with surfaces flat or double concave, substantially as described, and for the purposes set forth.

65,539.—E. G. BUDD, Budd's Lake, N. J.—*Water Wheel.*—June 11, 1867.—The buckets rise, resting on the inner perimeter, and when they reach the top are tilted over by contact with a roller, which gives them a position to receive the water, the position being further removed from the axis than during their ascent.

Claim.—The wheel proper, C C C C, D D D D, E E E, and L, the leverage buckets H H H H with levers I I I I, the adjustable wheel F with arm G, constructed substantially as and for the purposes set forth.

65,540.—SAMUEL S. BURT, Marquette, Mich.—*Railway Chair.*—June 11, 1867.—Explained by the claims and illustration.

Claim.—First, a three-part railway chair which is adapted for a reversible H rail, and so constructed that the base of the rail will be received and closely held partly by a recess *e* in the chair base and partly by recess *j*, the side supports B, substantially as described.

Second, in combination with a double-headed rail, constructed with flat shoulders at *c c*, a three-part chair A B B, with the lower head or base of the rail fitted into a recess *e* in the chair base A, and the lips of the rail heads, sustained by the upper portion C' C' of the side plates B B, substantially as described.

65,541.—CORNELIUS L. CAMPBELL, Binghamton, N. Y.—*Wagon Axletree.*—June 11, 1867.—The hollow portion of the skein is a conical frustum in the main, and has flattened parts at the larger end to fit suitable spots in the axle. The butting flange is cast upon it.

Claim.—Making the skein of the same angle from end to end, in combination with the depressions G G on the large end or shank of the skein, substantially in the manner and for the purpose herein described.

65,542.—HENRY C. CARDEN, Paris, France.—*Metronome.*—June 11, 1867.—The verge wheel is attached to a wheel having equal raised surfaces and depressions around its periphery, and these act on one end of a pivoted lever, whose other end is connected by a fine thread to an indicator attached to a spiral spring.

Claim.—The combination of the ratchet wheel *f*, mounted on an escapement wheel *e*, with the rocking lever *u*, the thread *v*, and the spiral spring *z*, in the manner and for the purposes substantially as herein set forth and shown in figures of the annexed drawing.

65,543.—CYRUS CLAY, Scranton, Pa.—*Boot-jack.*—June 11, 1867.—The boot toe is depressed by the cup while removing the boot.

Claim.—The concave toe cup C, handle *d*, and bail *e e*, as constructed and attached to the prongs *a a*, in combination with the metallic bootjack A, substantially as herein described.

65,544.—GEORGE COLLYER, Philadelphia, Pa.—*Turning Curves of Railroads.*—June 11, 1867.—The outer tread of the wheel is of less diameter and traverses the correspondingly shorter main track, which is proportionately elevated.

Claim.—The main rails A and B and the auxiliary rail C, when used in combination with car wheels, each having two treads *e f*, the whole arranged and operating substantially as set forth.

65,545.—S. CONSTANT, Peekskill, N. Y., and JOHN SMITH, Brooklyn, N. Y.—*Seasoning and Preserving Wood.*—June 11, 1867; antedated March 17, 1867.—Heated air is driven from the generator into the chamber containing the wood, the vapor escaping from the upper pipe. When the wood is dry wood tar is introduced into the generator and the resulting fumes impregnate the wood.

Claim.—The chamber A, generator D, in combination with blowers, bellows, or other suitable device to drive the heated air and smoky vapor out of the generator into the chamber, the connecting pipes H and I, and escape pipe K, all arranged and applied substantially as and for the purpose specified.

65,546.—HIRAM A. COPPES, Greenville, Ohio.—*Machine for Draining Sugar.*—June 11, 1867.—The inclosing cylinder rests upon a frame, and the rotating strainer, formed as the frustum of a cone, is attached to the cone within. This cone is attached to the motive shaft, which is stepped in the frame and has a tight and loose pulley. The cone has radial ribs to throw out the sirup. The strainer is a foraminous plate lued with gauze.

Claim.—First, the rotating strainer of the form of the frustum of a cone, as and for the purpose described.

Second, the combination of the conical distributor with the radial ribs, substantially in set forth.

Third, the rotating strainer A, in combination with the conical distributor B, the vertical shaft S, the fast pulley H', and the loose pulley H, in the manner explained.

65,547.—WM. CRUGHTON, WM. WILLS, and LOUIS RASTETTER, Fort Wayne, Ind.—*Feed Water Heater.*—June 11, 1867.—The center pipe has alternating convex and concave-topped disks, which cause an alternate outward and central discharge of the water therefrom during its descent. The steam passes up the center pipe and issues through holes in the side thereof.

Claim.—The center pipe *c* in combination with concave and convex disks, for the purpose of distributing the water and steam, in the manner and for the purposes described.

Second, the water and steam distributor E, the same being constructed in the manner and for the purposes described.

Third, the concave disk D in combination with the water and steam distributor E, the same being constructed and operated in the manner and for the purpose described.

65,548.—A. P. CURRY, Chagrin Falls, Ohio.—*Milk Can.*—June 11, 1867.—Between the plates of the bottom, which are concave inside, is an interposed rubber packing.

Claim.—The concave bottom B, auxiliary bottom C, and packing D, as constructed and arranged in combination with the can H, for the purpose and in the manner set forth.

65,549.—GEORGE S. CURTIS, Chicago, Ill., assignor to himself and ELLIS G. L. FAXON, same place.—*Attaching Draft to Vehicles.*—June 11, 1867.—The double-tree acts upon the rubber blocks through the bolt attached to its holding jaws.

Claim.—The combination of the ordinary whiffletree M and pole A with the bed plate B, the jaw E, the rod C, the rubber spring G, and the washer J, and the nut N, for the purpose of tightening and loosening the spring G, when all are constructed and operate substantially as and for the purposes herein described.

65,550.—WM. P. DUNLAP, Maquoketa, Iowa.—*Wrench.*—June 11, 1867.—The socket plate is pivoted between the prongs to allow oscillation. The sides of the block have varying openings.

Claim.—A wrench constructed substantially as and for the purpose set forth.

65,551.—DANIEL S. EARLY, Hummelstown, Pa.—*Meat Cutter.*—June 11, 1867.—The gearing rotates the chopping block and the shaft above. The shaft has cams which raise the cutters consecutively, and the latter drop by gravity.

Claim.—The combination of the rotating cutter block D, gearing E F G I, cam shaft J, and vertical spring choppers F, constructed and operating substantially as described and represented.

65,552.—Cancelled.

65,553.—Cancelled.

65,554.—ADAM ERNST, Milwaukee, Wis.—*Stove-pipe Drum.*—June 11, 1867.—The drum is placed above the stove, the vertical axial pipe or the serpentine course in the annular outer chamber affording a passage for the caloric current according to the adjustment of the damper in the vertical pipe.

Claim.—First, the herein-described heating apparatus, the same consisting of a drum or radiator capable of being applied to a stove or pipe of ordinary construction and provided with flues, arranged substantially in the manner and for the purposes herein shown and described.

Second, the combination and arrangement of the inner or direct smoke flue and annular air chamber surrounding the same with the outer helical flue or radiator, and the pipes or tubes for connecting the sections into which the said flue is divided, substantially as herein described.

65,555.—JAMES B. EUSTIS, New Orleans, La.—*Change Box.*—June 11, 1867.—This is a means of communicating with the street-car driver. The money is placed in the hopper, which is then oscillated to expose its contents outside, striking the bell on its passage. The change or tickets are substituted for the money, and the box restored to its former position.

Claim.—First, the oscillating box C pivoted at its ends to the flanges of plates B B, substantially as and for the purpose set forth.

Second, the oscillating box C pivoted at its ends in plates B B, in combination with the bell D, or its equivalent, arranged and operating substantially as described and for the purpose set forth.

65,556.—J. S. FARRINGTON, Milwaukee, Wis.—*Bed Bottom.*—June 11, 1867.—The pendent guide rods pass through double conical openings, at whose waist is a transverse plate of india-rubber, to prevent creaking of two wooden surfaces together.

Claim.—Top and bottom frame E with bell-shaped openings, with rubber B, guide rods A and pins D, all combined and arranged substantially as and for the purpose described.

65,557.—W. M. H. FLINN, Nashua, N. H., assignor to himself and JAMES N. KENDALL, same place.—*Tool for Cutting Wire.*—June 11, 1867.—Improvement on his patent May 8, 1866.—The stationary and movable die plates have corresponding openings of diameter to suit varying sizes of wires. One is reciprocated upon the other by a segment lever. The obliquity of the holes compensates for the inclination of the wire due to the impact of the cutters upon its opposite sides when fitting loosely in the holes.

Claim.—An improved wire or rod cutter made as described, viz: with each cutting hole of each pair of such holes of the plates B and c, arranged obliquely to the touching faces of such plates, substantially as and for the purpose hereinbefore described.

65,558.—CHARLES W. GAGE and JAMES NOR THRUP, Homer, N. Y.—*Mop Wringer.*—June 11, 1867.—The roller jaws are attached to a pail, are approached by a clasp spring, and opened by pressure on a treadle.

Claim.—First, in connection with the mop pail A, stationary roller B and swinging roller b, operated by the foot levers D d and springs H, when so arranged that the rollers are opened by the foot levers and the wringing done by the springs, substantially as and for the purpose set forth.

Second, the joint formed between the levers D d, by severing them at the foot-rest f, and pivoting their ends thereto, substantially in the manner and for the purpose set forth.

Third, the employment of the C springs H, as herein shown, and the method for regulating the pressure, substantially as set forth and for the purpose described.

65,559.—CHARLES GOOCH, Cincinnati, Ohio.—*Ice Cream Freezer.*—June 11, 1867.—One of the scrapers gives a centrifugal and the other a centripetal motion to the cream.

Claim.—The combination of the concave scraper I, to remove the frozen cream from the walls of the can D, the convex agitator H, extending from near the center of said can, arranged with a space i between them, and adapted to operate as herein described.

65,560.—DENNIS GOODYEAR, Ithaca, N. Y.—*Last Lock.*—June 11, 1867.—The plug passes through the last block into the last and its spur is secured to the latter by a partial revolution.

Claim.—First, the described device, composed of the parts G, the plug or pin F, the sheath and its dog or tooth and handle D, or other convenient equivalent, for turning and thus locking the same in the last as described.

Second, the device of a pin or plug thrust through the last block into the last and held there by friction, a dog or tooth or other convenient means, when the locking is done by the cam-like action of the pin or plug, as described.

65,561.—S. W. GOODYEAR and W. F. PARKER, Meriden, Conn., assignors to CHARLES PARKER, same place.—*Bolt-heading Machine.*—June 11, 1867.—The wire is fed through an opening in one of the dies into the circular plate, whose movement cuts it and presents another die to the same wire, and so on. Two headers attached to the same slide successively upset

and finish the head. In the first operation a spindle forms the back of the die, and in the second the blank touches the plate behind the die. The blank is forced out of the die by a plunger.

Claim.—First, the combination of the two heading punches f and c and spindle I with the revolving die plate C, all constructed, arranged, and operating substantially as set forth.

Second, the combination of the solid movable dies with the upsetting spindle I, arranged as described, so as to recede after the blank is upset and allow the complete head to be formed after the said spindle has so receded.

Third, the cam h, slide m, and pawl n, in combination with the pawl P and ratchet R, arranged and operating substantially as herein described.

65,562.—ARTHUR GRAY, Naples, N. Y.—*Joiners' Plane.*—June 11, 1867.—The "back iron" is screwed to the stock, and projects within the aperture. The cutter is placed between the back iron and the clamp, passing through a stirrup in the latter, which catches on the projection of the back iron. A screw in the clamp binds against the cutter.

Claim.—The combination of projection e on the back iron with the staple k and thumb screw m on the clamp, when arranged as and for the purposes set forth.

65,563.—JULIUS HACKERT, New York, N. Y.—*Metallic Compound or Alloy.*—June 11, 1867.—Composed of cream of tartar, $\frac{1}{2}$ lb; saltpeter, 1 oz; copper, $\frac{1}{2}$ lb; borax, 1 oz; zinc, 1 oz; and tuty, (impure protoxide of zinc,) 1 oz.

Claim.—A metal compound, made of the ingredients herein specified, and mixed together, substantially in the manner and about in the proportions set forth.

Also, the addition of saltpeter and cream of tartar to a compound of copper and zinc, substantially as and for the purpose described.

65,564.—GEORGE HADLEY, Buffalo, N. Y.—*Still.*—June 11, 1867.—The pipe rising from the still has successive condensers in ascending series, the liquid in which is gradually cooler as they recede from the still.

Claim.—First, a series of jackets of graduated temperature applied to the pipe of a still to eliminate by successive stages a fluid of given tenuity, and return the heavier condensed vapors.

Second, a tube a, leading from the still, and provided at different points in its length with a succession of condensers adapted to condense successive portions of the vapor therein.

65,565.—JAMES HALL, Monroe Township, N. Y.—*Machine for Making Cordage.*—June 11, 1867.—The cords are fed by rollers on the truck, actuated by a belt upon a pulley of the axle, as the truck is drawn by the endless rope, and recedes from the revolving spindles.

Claim.—The arrangement of the spindles 1 2 3, drum D, truck T, ways W W and rollers E E', with the endless rope or belt B, all operating together in the manner and for the purpose set forth.

65,566.—JOHN J. HARRIS and ISAAC H. MOSHER, Greene, N. Y.—*Door Holder.*—June 11, 1867.—The bolt is pointed to engage the floor at any place, and hold the door in the required position.

Claim.—As a new article of manufacture the bolt A, constructed and operating substantially as and for the purposes specified.

65,567.—HARVEY J. HARWOOD, Utica, N. Y., assignor to himself and J. F. LYMAN, same place.—*Screw Machine.*—June 11, 1867.—The blank is passed between rotating dies, by which the thread is impressed upon it without removal of metal.

Claim.—First, the combination of the dies I and K and the guides M M, constructed and operating substantially as described, and for the uses and purposes mentioned.

Second, the combination of the said dies and guides, and the set screw M', constructed and operating substantially as described, and for the uses and purposes mentioned.

65,568.—HORACE R. HAWKINS, Akron, Ohio.—*Lathe for Turning Wood.*—June 11, 1867.—The driving center is placed eccentrically in the face plate.

Claim.—The combination with a turning lathe of ordinary or suitable construction of a face plate and eccentric or driving center under such an arrangement that the arm of the axle placed in the machine may be turned with a combined gather and pitch, in the manner herein shown and specified.

65,569.—AZRO HEALY, Kalamazoo, Mich.—*Lifting Jack.*—June 11, 1867.—The ratchet bar is raised to the axle by a draw cord and held up by the clevis pawl on the lifting bar, which is pivoted to and raised by the secondary lever, raised in turn by the hand lever and carrying a segmental ratchet engaged by a pawl. The ratchet bar is released by a draw rod which draws up the clevis pawl.

Claim.—First, the arrangement and combination of the prime lever L, lifting chain M, and secondary lever N, with the end ratchet R and foot pawl P', substantially as and for the uses herein set forth.

Second, the aforesaid arrangement of combined parts used in connection and combination with the lifting bars F and E, lifting pawl P², and manipulating cords or wires e and f, the several parts being arranged relatively with the frame of the jack and with each other, and constructed and operated substantially in the manner and for the purposes herein described.

65,570.—A. E. HEBERD, Homer, N. Y.—*Well Tube.*—June 11, 1867.—The tube is slotted vertically; has a spirally grooved drill point riveted to its lower end, and a cap to its upper end, over which may be placed an anvil block.

Claim.—The combination of the auger D secured to the tube C by bolt F, cap A, anvil B, bar G, with the tube, all constructed, arranged, and operated as described.

65,571.—HENRY HELM, Pittsburg, Pa.—*Feed Cutter.*—June 11, 1867.—The knife plate is curved on its cutting edge and is set eccentrically on its block by screws and slots, by which it may be set forward as it wears. Its prominent corner enters the guiding groove of a curved bar attached to the box.

Claim.—First, the rotary eccentric knife g provided with slots h h', in combination with the knife block f, substantially as and for the purposes described.

Second, the projection p on the knife of a feed cutter in combination with the curved bar l provided with a notch or groove l', substantially as and for the purpose above described.

65,572.—GEORGE WM. HOLDEN, Claremont, N. H., assignor to himself and JAMES P. UPHAM, same place.—*Water Wheel.*—June 11, 1867.—The wheel has a central discharge. A guide at the rear side of each bucket directs the water to the next. A gate at the end of the scroll water-way gives passage to obstructions. The step is restricted to a vertical path and adjusted by a rack and pinion.

Claim.—First, the guides m applied at the backs of the buckets of the water wheel, substantially as and for the purposes specified.

Second, the reverse curves l at the outer ends of the water wheel buckets, in combination with the guides m at the back and outer ends of the buckets, substantially as and for the purposes set forth.

Third, the curved lower edge n of the bucket in combination with the guide m, substantially as and for the purposes specified.

Fourth, the movable curved section u hinged to the swinging section s that moves with the shaft t, substantially as and for the purposes set forth.

Fifth, the segmental gate p in combination with the movable curb section u and swinging section s, as and for the purposes specified.

Sixth, the lever v, fitted substantially as specified, in combination with the swinging section s and curb section e, for the purposes set forth.

Seventh, a horizontal shaft x extending from the step for the shaft c to the outside of the water-way, to one end of which mechanism is applied to turn the same, substantially as specified, and the other end is fitted to act upon the step to raise or lower the same, by substantially the means specified.

65,573.—JAMES HOLLINGSWORTH, Chicago, Ill., assignor to J. M. WANZEI, same place.—*Horse Rake.*—June 11, 1867.—The rake teeth pass through blocks which are strung on their pivot bar and are held by set screws. The teeth have an upper bearing in a perforated flanged pin, one end of which is surrounded by a spiral spring, by which a certain oscillation is allowed to the teeth. The rake is thrown up for discharge by a pivoted lever.

Claim.—First, the construction of a rake tooth bearing J with three passages at right angles to each other, when said bearings are of a form to abut directly against one another and the teeth extend clear through the top passage of the bearing, substantially in the manner and for the purposes described.

Second, the construction of the eye bearings g for supporting the rake teeth T, and holding the spring, substantially as described.

Third, the combination of the jointed bearings J and eye bearings g with a rake tooth of the form substantially as herein described.

Fourth, the combination of the bearings J with set screws l, the rocking frame with its arms and the eye bearings g, with their springs, substantially in the manner and for the purposes described.

65,574.—EDWIN J. HORNER, Wilmington, Del.—*Car Spring.*—June 11, 1867.—A semicircular notch in the side of each plate at its mid-length engages the vertical rib of the box.

Claim.—A series of oblong metallic semi-elliptical plates, each having an opening x near its center arranged together, as herein shown, with full elongated ellipses between semi-elongated ellipses placed within a box A, having a vertical rib d, whereby they are alone secured in their proper places and held by the pressure of a grooved block B, in the manner as herein specified.

65,575.—JOHN S. HOWELL and CHARLES W. CARTER, Portsmouth, N. H.—*Lozenge Machine.*—June 11, 1867.—The cutters on the traversing carriage pass up into holes in the clearing board, which is supported on springs and depressed by the roller to sufficiently unmask the cutters. The lozenges fall upon the receiving board beneath.

Claim.—The combination and the arrangement of the roller a and the traversing carriage f, carrying the cutters c, clearing board e, and receiving board g, all combined for joint operation, substantially as set forth.

65,576.—H. P. JONES, Davenport, Iowa.—*Wind-ing Tattling Shuttles.*—June 11, 1867.—The tattling shuttle is secured to the rotating arm by thimbles which slip on the arm and clasp the points on each end of one shell of the shuttle. The thread is guided by an eye as it comes from the spool.

Claim.—The employment of sliding tubes or rings a a, upon the ends of the rotating rod D, so as to receive and secure in place tattling shuttles of different lengths, substantially as and for the purpose described.

65,577.—JOHN KILLGORE, G. D. CLAPSADDLE, and EDWARD SNART, Arcola, Ill.—*Post-hole Auger.*—June 11, 1867.—The pin in driving sinks into its socket and the wings enter the soil. In raising, the pin slips out partially and allows air to enter below the auger, which is lifted by throwing the band-wheel into engagement.

Claim.—The arrangement of the sleeve J, and its pin K, with the shaft H, frame B, and band G, substantially as and for the purpose herein specified.

65,578.—ROBERT B. KILLIN, Canton, Ohio.—*Corn Dropper.*—June 11, 1867.—The separator may be used to keep the seeds from falling together or by removal allow them to fall in a bunch. The spring prevents the leakage of seeds when the valve standard is pushed up. The latter is made partly of wrought and partly of cast iron.

Claim.—First, the separator J, attached to the valve standard B, in the manner and for the purpose herein specified.

Second, the spring H, attached to the valve standard of this or any other seeding machine, substantially in the manner and for the purpose herein set forth.

Third, the mode of construction of the valve stand-

ard B, the red X being made of wrought iron and the part Y of cast iron, substantially in the manner and for the purpose herein specified.

65,579.—GEORGE W. LADD, Providence, R. I., assignor to JOHN A. BROWN, same place.—*Making Side Bands of Watch Cases.*—June 11, 1867.—The side band is made of three portions; a central band and two rims, one on each side; the latter have grooves into which the snapping edges of the lids fit. The pieces are made separately, and they are afterwards soldered together.

Claim.—The method of constructing the side bands for watch cases, substantially as herein described for the purposes specified.

65,580.—CHARLES L. LEGE, San Antonio, Texas.—*Medical Preparation.*—June 11, 1867.—For the preparation of poultices, or as a medicine, for the remedy of scurvy. The fleshy parts of the cactus opuntia are dried and reduced to powder.

Claim.—The invention of making this powder and its application as a poultice and a medicinal remedy against the scurvy, as herein described.

65,581.—WILLIAM P. LEWIS, Pittsburg, Pa., assignor to himself and WILLIAM H. SIMS.—*Casting Tweers.*—June 11, 1867.—The central pipe has a groove around its outer surface on which the heads of the outer shell are cast, making a water-tight joint. One or both ends of the centre pipe have a removable tip.

Claim.—The method of beveling the ends of the centre pipe of a twee, substantially as described, and casting the ends of the outer shell of the twee onto and around the surfaces so beveled or flanged, substantially as and for the purposes set forth.

65,582.—SAMUEL MALES, Cincinnati, Ohio.—*Safety Guard for Railway Cars.*—June 11, 1867.—The guard casing extends in front of both wheels, and between the pedestals it is vertically adjustable on its supporting eye bolts.

Claim.—First, the adjustable guard made in sections encasing the wheels, substantially as and for the purpose set forth.

Second, the arrangement of ratchet bow, catch, links, bolts, nuts and springs which admit of the perpendicular adjustment of the guard, substantially as described.

65,583.—GEORGE MEADER, Prairie Centre, Ill.—*Potato Digger.*—June 11, 1867.—The two outer tines form the ends of a yale pivoted to a foot-bar, and act as a support to the other tines when the potatoes are raised from the ground.

Claim.—The combination of the standards D, and the fork C, or its equivalent, provided with suitable handles, and arranged and operating substantially as and for the purposes specified.

65,584.—GEORGE MEADER, Prairie Centre, Ill.—*Mop Head.*—June 11, 1867.—The pivoted jaw is oscillated so as to clamp the cloth against the cross-head, where it is maintained by a latch.

Claim.—The combination of the handle A, plate B, jaw C, and latch D, all arranged and operating substantially in the manner and for the purposes specified.

65,585.—ISAAC M. MILBANK, Greenfield Hill, Conn.—*Breech-loading Fire-arm.*—June 11, 1867.—The breech-block is held down by a segmental pin having a lever which is held between a projection of the cock and a pin in the stock to prevent its turning when the cock is down. At half-cock the lever may be thrown up to release the breech-block.

Claim.—First, the segment of a cylinder *i*, within a recess at the rear end of the swinging breech-block *c*, in combination with the lever *f*, that is employed for both turning the said segment *i* and opening or closing the breech by the block *c*, substantially as and for the purpose set forth.

Second, supporting and guiding said segment *i*, by the cylindrical portion at *z*, as set forth.

65,586.—EUGENE WILLIAM NOHI, Ripon, Wis., assignor to himself and EDWARD DANIELS, Chicago,

Ill.—*Furnace for Reducing Metallic Ores.*—June 11, 1867.—Explained by the claims.

Claim.—First, a furnace provided with short pipes or passages for introducing the gas, hot from the generator, into the furnace, and also with a blast of air, the meeting currents of gas and air directing the flames upon the ore, substantially in the manner and for the purposes set forth.

Second, the raised center of the bed of the furnace for supporting the ore, and allowing the fused metal to flow away from the central heat and be drawn off without being overheated or burnt, substantially as described.

Third, a gas generator provided with a blast, in combination with a furnace for burning the gas before cooling, substantially in the manner and for the purpose specified.

65,587.—I. G. NORTHWAY, Kenosha, Wis.—*Brace for Supporting Thrashing Machines.*—June 11, 1867.—The brace and dog are hinged to the base piece, the latter engaging a ratchet of the former.

Claim.—The combination of bed A, brace B, and dog C, when arranged substantially as set forth.

65,588.—A. M. OLDS, New York, N. Y.—*Self-adjusting Wrench.*—June 11, 1867; antedated May 27, 1867.—The outer jaw is pivoted to the shank, and has a rectangular inner bend to engage the nut which is forced in contact with the serrated surface of the other jaw.

Claim.—The above-described wrench as an improved article of manufacture.

65,589.—A. M. OLDS, New York, N. Y.—*Pliers.*—June 11, 1867; antedated May 27, 1867.—The segmental arm on one of the handles passes through a slot in the removable jaw, and by its spiral form opens or closes the jaw and retains it in the position to which it is adjusted.

Claim.—The combination of the handles, segmental spiral arm, and movable jaw, substantially as arranged and described.

65,590.—JAMES A. OLNEY, Providence, R. I.—*Machine for Making Paper Tubes.*—June 11, 1867.—A strip of paper of the requisite width is fed from a roller, passed between the presser and the gummy, endless belt, and is wound upon the fluted roller, coil upon coil, the surfaces adhering. The fluted roller is then raised above the shears which cuts the strip; the discharger slips the paper tube from its mandrel, which is then lowered upon the strip and the work is resumed.

Claim.—The combination as well as the arrangement of the endless pasting or covering belt B, the trough F, the presser G, the fluted roller H, the discharger K, and the scissors O, the said belt, scissors, roller and discharger being provided with mechanism for operating them, substantially as described.

Also, the combination as well as the arrangement of the endless pasting belt B, the trough F, the feed roller M, the fluted roller H, the discharger K, and the scissors O, the said belt, feed roller, scissors roller and discharger being provided with mechanism for operating them, substantially as described.

Also, the combination as well as the arrangement of either or both of the devices *t u*, the endless carrying and pasting belt B, the trough F, the presser G, the fluted roller H, the discharger K, the scissors O, such belt, scissors, roller, and discharger being provided with mechanism for operating substantially as hereinbefore described.

65,591.—CALVIN H. PAINE, Providence, R. I., assignor to himself and WM. D. HILTON, same place.—*Gate.*—June 11, 1867.—The gate is made on the principle of the lazy tongs, and when fully expanded or retracted its ends enter recesses in the posts.

Claim.—The combination of the chambered posts, or their equivalents, and the folding gate made of the crossed bars connected as described.

Also, the combination of the chambered posts, or their equivalents, the folding gate and mechanism, substantially as described, for operating such gate in manner as explained.

65,592.—CALVIN H. PAINE, Providence, R. I., assignor to himself and WM. D. HILTON, same place.

—*Fence*.—June 11, 1867.—The filling of the panel consists of pivoted strips which are expanded from post to post and between the upper and lower rail when in use; but may be removed from their adjuncts and collapsed for transportation.

Claim.—The fence as made with the lazy tonges, or folding section or body, arranged and combined either with grooved posts or the same and rails, substantially as specified.

65,593.—WM. P. PARROTT and J. J. BORDMAN, Boston, Mass.—*Apparatus for Amalgamating and Collecting Gold and Silver from Ores*.—June 11, 1867.—Explained by the claims and illustrations.

Claim.—A combination consisting of not only one or more rollers and one or more troughs of mercury or for holding mercury, but of one or more scrapers, or their equivalents, for removing the amalgam from the surface or surfaces of such roller or rollers, the whole being substantially as described.

Also, the arrangement of two rollers and their mercury troughs, so that the said rollers while in revolution may take up the mercury from the troughs, and by their combined action press it against or cause it to adhere to and spread evenly on their surfaces.

Also, the construction of the mercury trough so as to extend up between the two rollers and guide the mercury up to their bite while they are in revolution, the same being as exhibited in Fig. 6.

Also, the combination of the heating chamber E, or a means of heating the trough of mercury or the same and its roller or rollers, with the said trough, the roller or rollers, and the scraper or scrapers thereof, as specified.

Also, the arrangement of the auxiliary rollers R R with the main rollers B C, their scrapers, and mercury trough, as explained.

Also, the combination as well as the arrangement of the riddle O with the trough D, one or more rollers B C, and one or more scrapers N N.

Also, the combination of mechanism for imparting to either or both of the rollers B C endwise movements under circumstances as set forth, with such rollers, the mercury trough, and the scrapers or their equivalents, the whole being substantially as specified.

65,594.—F. S. PEASE, Buffalo, N. Y.—*Blast Apparatus for Carbureters*.—June 11, 1867.—The four cams, at 90° apart on the shaft, come consecutively into action upon the bellows, and thus keep a constant tension of air in the main air chamber above.

Claim.—The arrangement of the shaft A, cams B B, dividing the circle and operating the bellows of corresponding numbers, which are adjusted as to capacity by the check string c, the whole constructed and operated substantially as described and represented.

65,595.—F. S. PEASE, Buffalo, N. Y.—*Blast Apparatus for Carbureters*.—June 11, 1867.—The eccentrics on the rotating shaft divide the circle, so as to give a continuous blast of air from the upper bellows, which receives air from the lower bellows consecutively.

Claim.—First, the double bellows A, so constructed that the sections are reciprocally operated by the same impulse from crank or eccentric on a rotary or vibrating shaft, substantially as described.

Second, the combination of the rotary or vibrating shaft G, provided with cranks or eccentrics, the connecting rods H, and series of double bellows A A, substantially as described.

65,596.—GEORGE B. PERKINS, Bridgeport, Conn., assignor to BURLOCK MANUFACTURING COMPANY, same place.—*Shirt Bosom*.—June 11, 1867.—The supplemental bosom consists of two side pieces with corded edges, which are attached to the shirt by their outer sides.

Claim.—A bosom attached to the shirt over the bosom proper thereof, expanding in width from its attachment to the collar band, and narrowing in its approach to the waist, as shown, and strengthened longitudinally by cording, all substantially as described.

65,597.—C. W. PIERCE, Albany, N. Y.—*Construction of Pots for Charring or Burning Bones*.—

June 11, 1867.—The bottom is radially slotted to prevent fracture by unequal expansion from heat.

Claim.—In the construction of pots for use as described, the division of the bottoms of the pot into parts, separated from each other by slots, constructed and arranged as described and for the purposes set forth.

65,598.—EDWIN S. PIPER, Indianapolis, Ind., assignor to himself and ATKINS & Co., same place.—*Hardenings Saws*.—June 11, 1867.—The saw plate is clasped and rigidly held while being lowered into and during immersion in the oil baths.

Claim.—First, the preventing of springing of saws during the process of hardening.

Second, the construction of the clamps.

Third, the combination of the lever N, cam M, hook K, rim L, double hook T, plunger G, and knuckle joints H H with the clamp D and clamp F, all arranged and operating substantially as set forth and for the purpose described.

65,599.—JOHN PLAYER, Norton, England.—*Hot Blast Stove*.—June 11, 1867; antedated April 21, 1866.—Improvement on his patent March 29, 1865. From the fire chamber the calorific current passes to a combustion chamber, and from thence through apertures in a brickwork arch to the chamber containing the heating pipes.

Claim.—The constructing and arranging of a hot blast stove to be used with coal or solid fuel, with three distinct chambers, in the manner herein described.

Also, the use, in conjunction therewith, of a steam jet as herein described.

Also, the use of a steam jet to draw down the gases from the top of the blast furnace and to force it into the stove for heating the blast.

65,600.—JOHN PLAYER, Norton, England.—*Apparatus for Heating the Blast for Furnaces*.—June 11, 1867; antedated March 25, 1865.—The gases from the blast furnace pass into a combustion chamber, and from thence through openings in the arch of the same to the chamber containing the air-heating pipes.

Claim.—The constructing or arranging of a hot blast stove in the manner herein described, whereby the waste gases are ignited and consumed in a chamber separate from the chamber within which the pipes are contained.

65,601.—JAY W. POWERS, Evanston, Ill.—*Hinge*.—June 11, 1867; antedated May 28, 1867.—The cam is pivoted to two leaves of the hinge, passes through a long slot in the other one, and has a vertical pin engaging its further side. The said cam governs the relative movement of the leaves.

Claim.—The cam D, applied to a triplicate hinge, constructed and operating substantially as and for the purposes herein set forth.

65,602.—STEPHEN PUFFER, Oxford, N. Y.—*Car Coupling*.—June 11, 1867.—The ends of the coupling link are extended beyond the pivot, to be acted on by the detachable cam block of the other bumper, to cause automatic coupling.

Claim.—First, the combination of cams c with the pivot ends of a detachable swivel-jointed coupling link E, when said ends are so arranged as to be struck by the collision of the cars when thrown back upon the bumper.

Second, the combination of a detachable bumper block with either bumper of a railway car and with a swinging coupling link, all substantially in the manner and for the purposes set forth.

65,603.—PATRICK QUINN, South Newmarket, N. H.—*Ferrule for Stopping Leaks in Boiler Tubes*.—June 11, 1867.—Improvement on patent No. 39,717. The expander is conical on its outer side and screws into the inner end of the gland, and is made hexagonal on the inner side to enable it to be turned by a key.

Claim.—The gland and the expander, as made not only with the male and female screws, and with either or both tapering as specified, but as having a keyhole formed in the bore of the expander, as set forth.

65,604.—N. B. REYNOLDS, Auburn, N. Y.—*Forming Projections on the Caps of Plane Irons.*—June 11, 1867.—The buttons made by punching rivet holes in boiler plates are inserted in the chamfered holes in the caps for plane irons. They are settled therein by a savage blow and then bored and dressed.

Claim.—The method of construction substantially as described.

65,605.—SAMUEL RICHARDS, Philadelphia, Pa.—*Snow Ploa.*—June 11, 1867.—The wedge and its pivoted flap may be used on either side or centrally and is moved by an endless chain and windlass.

Claim.—The combination of the inclined plane A, A', and the movable wedge block B, and the pivoted flap c, arranged and operating substantially as described.

65,606.—GEORGE RICHARDSON, Lowell, Mass.—*Let-off for Looms.*—June 11, 1867.—The whip-roll finger rests on a spring bar connected to one end of a strap brake on a grooved pulley whose shaft is engaged to the yarn roller.

Claim.—The combination of the whip-roll finger e, tension rod f, tension spring k, grooved or equivalent shaped wheel o, and strap or band n, arranged and operating together substantially as and for the purpose herein specified.

Also, the combination of the cam h, adjustable finger g, rod j, and strap n, for producing a positive stop to the let-off motion while beating up the woof, substantially as herein specified.

65,607.—B. S. ROBERTS, United States Army.—*Breech-loading Fire-arm.*—June 11, 1867.—The breech block swings vertically on a curved abutment formed on the frame to which the barrel is secured. On the front end of the breech piece is a rocking block which fits against the rear of the bore, and a groove on the block operates the cartridge-case loosener.

Claim.—First, the combination with a breech piece B, which springs about a curved abutment e, a rocking block g, so applied to said breech piece as to allow of the opening and closing of the breech of the barrel for the insertion or withdrawal of a cartridge, substantially as described.

Second, the lever B', formed on the rear curved end of the swinging breech piece B, and adapted to move about the solid abutment e, in combination with a rocking block g, which will admit of the opening and closing of the breech, substantially as described.

Third, the groove m, in the rocking block g, operating on the lever at the shoulder n, so as to extract the cartridge, substantially as described.

65,608.—WILLIAM ROBERTSON, Plymouth, Ind.—*Hanging Window Sash.*—June 11, 1867.—The pulley block is fitted in the top of the groove in the jamb casing and affords a means of hanging the sash so as to be removable, the pulley block occupying the same groove as the parting strip.

Claim.—The pulley block F, when constructed and arranged substantially as and for the purpose set forth.

65,609.—ROBERT ROSS and B. E. LEHMAN, Bethlehem, Pa.—*Lubricator.*—June 11, 1867.—Oil is admitted from the mouth to the reservoir, by depressing the spindle which opens the oil communication, and turning the upper set screw which permits the passage of air. Turning the spindle brings into correspondence the openings in the cap of the spindle and the branch which leads to the machinery and permits oil to flow to the latter.

Claim.—First, the combination of the spindle D, its valve f, cap k, spring m, projection n, and passages p p', the whole being constructed and arranged in respect to the mouth and reservoir of the oil cup, substantially as and for the purpose herein set forth.

Second, the combination of the above and the hollow spindle D, its vent hole b, and the set screw F, for the purpose specified.

Third, the ring C, resting with its notched under edge in the mouth A, and forming a rest for the spring I, all as set forth.

Fourth, the detachable annular strainer H, constructed and combined with the ring C, spindle D, and spring I, as described.

65,610.—A. P. ROUTH, Liberty Mills, Va.—*Seeding Machine and Fertilizer.*—June 11, 1867.—The rotating seed roller carries down the fertilizer and seed to a common spout. A brush clears the seed from the top of the seed cavities, and a reciprocating agitator having two upper and two under projections acts on the fertilizer.

Claim.—First, the furrowing tooth C, having the broad reversible plate or shovel w, and the brace v, substantially as and for the purpose specified.

Second, the agitator M, in the fertilizer box, having the arms z z' z'' z''', substantially as and for the purpose described.

Third, the construction of the conducting tubes, feed box, and distributing roller in such a manner as to show at S the distributing roller N, and the interior of the conducting tube H, substantially in the manner and for the purpose specified.

65,611.—JOSEPH RYAN, St. Louis, Mo.—*Scuttle Door for Buildings, Dry Docks, and Vessels.*—June 11, 1867.—The scuttle door admits of inspection of the enclosed space and permits the entrance of nozzles or hose for extinguishing fire; they are otherwise water tight.

Claim.—The combination and arrangement of a scuttle door B, having one or more fire safety openings d', and conducting and distributing hose or pipes d² d³ d⁴, with decks, ropes, &c., substantially in the manner and for the purposes herein set forth.

65,612.—HENRY C. SERGEANT, Columbus, Ohio.—*Brick Machine.*—June 11, 1867.—The clay is pressed from the pug mill into the mold, while the latter is underneath and the follower depressed. The follower travels on a track by which it is raised to press the brick against the arm, which travels with it a short distance. The bricks then pass below the striker and are ejected by another rise of the follower.

Claim.—First, lowering the followers at intervals, or continuing the lowering while under the pug mill as the molds are being filled, to facilitate the filling of the corners of the molds.

Second, the adjustable striker plate, having a bolt or slot for clamping, as shown and described.

Third, the arm D, having an intermittent motion in combination with the rise in the track, as shown and described.

Fourth, the pins or projections on the rim of the mold wheel for giving motion to a pressure plate or arm D, or its equivalent, as shown and described.

65,613.—HENRY C. SERGEANT, Columbus, Ohio.—*Brick Machine.*—June 11, 1867.—The mold wheel has a series of inclined tracks on its periphery which come beneath the axis of the roller to raise it from the face of the mold wheel. The axis of the roller is hinged to a collar on the central shaft and the action of the roller is to press the upper faces of the bricks.

Claim.—First, the weight E, with its arm when made to hinge and turn upon the shaft of the mold wheel for the purpose specified.

Second, the inclined tracks when attached to the periphery of the mold wheel for raising or dropping a weight upon the face of the brick for finishing, as shown and described.

Third, the arm, toe, and incline on the end of arm for facilitating the rising and getting the weight back to its place.

Fourth, the stop i, attached to the arm or weight E, when operated to drop into holes or notches for the purpose of preventing the weight from sliding on the brick when being raised up, as shown and described.

65,614.—REUBEN SHALER, Madison, Conn.—*Cover for Gridirons.*—June 11, 1867.—The recessed cover has a central hole with a disk attached below it.

Claim.—A cover having an opening C, and protected from below by a plate D, substantially as and for the purpose specified.

65,615.—WILLIAM H. SHURTLEFF, Providence, R. I.—*Button-lacing Hook.*—June 11, 1867; antedated May 9, 1867.—The disk-shaped end has prongs, for attachment to the garment; the shank is bent into a hook form and the end turned up and attached to a button.

Claim.—First, making a button hook, in which the hook is within the periphery of and eccentric to the bottom of two, separate and distinct, united together at or near the center of the button, substantially as herein shown and described.

Second, as a new article of manufacture, a lacing hook and button, in which the button is made of horn, hoof, rubber, or other like material, and the hook of metal, the two being combined together, substantially in the manner herein shown and described.

65,616.—DANIEL M. SKINNER, Sandwich Center, N. H.—*Plate Lifter.*—June 11, 1867.—The loop jaws embrace the rim of the plate when the spring handle is compressed.

Claim.—The plate lifter, made as described, viz: Of a wire, bent as shown at *a b c d f g h i k l*, so as to form the elastic handle portion *A*, and two open jaws *B B*, as represented.

65,617.—AMBROSE TOWER, New York, N. Y.—*Cap for Upholsters' Springs.*—June 11, 1867.—The cap rests upon the upper coil, has arms to afford extended bearing for the mattress, and eyes by which it is attached to similar, neighboring caps.

Claim.—A grooved metallic cap for upholstery springs, having arms *A* and *B*, eyes *G*, and attachments *D*, constructed and arranged substantially as herein specified.

65,618.—JOHN H. TREADWELL, Swampscott, Mass.—*Tart Cutter.*—June 11, 1867.—The outer cylinder cuts the margin and the inner block makes the depression to hold the jam.

Claim.—The tart cutter, as made with the die *C* and the cutter box *A*, arranged as specified.

Also, the combination of the handle *B*, the cutter box *A*, and the die *C*, arranged as specified, the said box being provided or not with air holes, as described.

65,619.—H. B. VAN VOORHIS, Pittsburg, Pa.—*Gate.*—June 11, 1867.—The upper pintle of the gate moves in an oblique slot in a horizontal plate on the top of the post, and is moved by a slotted, oscillating lever, which is actuated by wires from distant levers, within reach of an equestrian. The action is to tilt the gate in one direction or the other to open or close it.

Claim.—First, the combination of the slotted plate *A*, slotted lever *B*, and pin *C*, substantially as and for the purpose set forth.

Second, the combination of these devices with the catches *L* and *N*, as and for the purpose set forth.

65,620.—AARON VOTAW, New Garden, Ohio.—*Churn.*—June 11, 1867.—The case is charged with cream and the lid fastened; it is then rotated and the cream dashes against the ribs and beaters.

Claim.—The arrangement of the breakers *E* and ribs *H I*, in combination with the case *C*, when operated in the manner and for the purpose substantially as set forth.

65,621.—W. W. WAKEMAN, JR., New York, N. Y.—*Lamp for Burning of Paint.*—June 11, 1867.—The alcohol, vaporized by the lamp, passed in a stream across the flame, and being lighted, impinges in a jet upon the surface of paint.

Claim.—First, the reservoir *A* placed over the lamp *L*, substantially as and for the purposes herein set forth.

Second, the expanded mouth *G* of the pipe *F*, or its equivalent, substantially as herein described.

Third, the independent lamp *L*, operating substantially as and for the purpose herein specified.

65,622.—JOHN N. and THEODORE WALLIS, Fleming, N. Y.—*Wagon Axle and Box.*—June 11, 1867.—A collar is screwed to the inner end of the axle arm, and a thimble on the axle is screwed into the box of the hub.

Claim.—First, the collar *D*, in combination with the thimble *E*, and box *B*, when all are constructed, arranged, and operated substantially in the manner and used for the purpose specified.

Second, securing the sand band *C* to the box *B*, as and for the purpose specified.

65,623.—CHAUNCEY E. WARNER, Syracuse, N. Y.—*Churn.*—June 11, 1867.—The central axis and its sleeve are revolved in different directions by their pinions and the master wheel. The dashers are pivoted and expand as they revolve.

Claim.—First, the hinged beaters *e f*, in combination with the shafts *B C*, and gears *b c d*, all constructed and operating as and for the purpose herein shown and described.

Second, in connection with the above, also the sliding hub *m*, for adjusting the upper beaters to varying quantities of cream, as and for the purpose set forth.

65,624.—JAMES WHAIT, Springfield, Mo.—*Foot Scraper.*—June 11, 1867.—Shucks or fiber are clamped in the jaws which rise from each end of the scraper plate.

Claim.—The hinged hollow sides *D D*, in combination with the scraper *B*, all constructed and arranged as and for the purpose set forth.

65,625.—NORMAN W. WHEELER, Brooklyn, N. Y.—*Water Anchor.*—June 11, 1867.—The cruciform frame has (when in use) a belying canvas attached, to whose middle portion is suspended a ballast weight. The frame spreads by tension of its ropes, and is collapsed by the spilling line to be hauled on board.

Claim.—First, the water anchor herein described, when the ropes *f f* are so arranged in reference to the cross-pieces *C D* as to expand the anchor by their tension, in the manner and for the purposes described.

Second, in combination with the above, the spilling line attached, and operating substantially as and for the purposes described.

Third, the combination of the weight *l*, canvas *E*, and cross-pieces *A A*, when arranged in the manner described.

65,626.—WM. H. WHITE, Kent Island, Md., assignor to himself and GEORGE W. WHITE.—*Dish Cover.*—June 11, 1867.—The wire skeleton is covered with netting.

Claim.—The combination of a skeleton frame and a fabric cover, when the former is shaped and constructed to hold in place a fabric cover, and the latter made detachable from the frame, for the purposes herein shown and described.

65,627.—AARON S. WINNER, Clark county, Ill.—*Quilting Frame.*—June 11, 1867.—Gains in the benches receive the shafts of the roller on which the quilt is wound. Ratchets on the ends of the rollers and pawls on the benches admit of and then maintain the required adjustment of the rollers.

Claim.—The construction of the self-supporting trestles or benches with the gains, in combination with the wheels and catches, arranged in the manner and for the purpose described.

65,628.—LEWIS W. WORTH, Sonoma, Cal.—*Paper Reel for Telegraphic Register.*—June 11, 1867.

—The ribbon of paper issuing from the telegraph register is strained by winding upon a drum, which is revolved by a weighted cord which passes around a pulley and is then wound round the axis of the drum. The latter is secured by pawl and ratchet to its axis, which permits the cord to be wound on the latter.

Claim.—The reels *B C*, adjustable drum *F*, with ratchet *P*, pawl *R*, and spring *S*, with cord *L*, arm weight *W*, for the purpose herein specified as set forth.

65,629.—WM. J. ANDREWS, Columbia, Tenn.—*Beehive.*—June 11, 1867.—The boxes are detachable, and the intercommunication is governed by a slide to each; the slides are moved simultaneously to confine the bees in each apartment, the grated cover stopping exit from the chamber at the entrance while the transfer of boxes or bees is being made.

Claim.—First, the semicircular pieces *F F*, the movable covers or caps *G G*, and the upright bar *H*, when used in the manner and for the purpose as herein specified.

Second, the moth trap *K*, when it is provided with the grated cover *I*, and feeding trough *L*, arranged in the manner and for the purpose specified.

65,630.—JONAS C. BAGNALL, St. Louis, Mo.—*Checking the Draft in Furnaces.*—June 11, 1867.—By opening the door in the smoke stack, atmospheric air is admitted, and the draft of the furnace checked.

Claim.—The arrangement of a door *b* in the smoke stack of a reverberatory furnace, and above the reverberatory line thereof, substantially as and for the purpose described.

65,631.—D. A. B. BAILEY, St. Johnsbury, Vt.—*Combination Square.*—June 11, 1867.—The triangular frame slides upon one arm of the square, and has an adjustable face hinged at one end, and secured by a set screw on its arc guides, and carrying a point which acts in apposition to a corresponding one on the face, which stands rectangularly to the arm of the square.

Claim.—The frame B B', the face pieces D, the circle E, and the points *g g*, the whole constructed, arranged, and held in position substantially as herein shown and described, in combination with the square, for the purposes set forth.

65,632.—D. B. BAKER, Rollersville, Ohio.—*Bag Fastener or Tie.*—June 11, 1867.—The halves of the clasp are hinged to a loop, and the hook of one engages one of the series of holes in the other to tie the neck of the bag.

Claim.—The metallic clasp for bags, constructed as described, consisting of the semicircular parts A A', whose wide sides rest against the bag, connected at one end by the link B, the opposite ends fastened by means of the triangular projections *b*, catching into the perforations *c*, the part A provided with the finger rest *d*, as herein shown and described.

65,633.—JOHN BANNIER, Hempstead, N. Y.—*Velocipede Sled.*—June 11, 1867.—The segment rack of the lever rotates the wheel, whose pivoted claws engage the ground and propel the sled.

Claim.—The claws *n*, pivoted on wheel C, on each side of a sled, in combination with the levers D, or their equivalent, for rotating the wheels, constructed and operating substantially as herein set forth.

65,634.—N. S. BEAN, Manchester, N. H.—*Hose Carriage.*—June 11, 1867.—Explained by the claims and illustration.

Claim.—First, in combination with the reel and its shaft, a winding shaft *i*, arranged upon the frame *a*, and connected to and rotating the reel shaft through the pulleys and their chains, substantially as shown and described.

Second, the arrangement of the reel shaft in bearings directly on the frame *a*, and directly over the carriage axle, when such axle is bent to permit the reel heads to run free from the same, substantially as set forth.

Third, the construction of each reel head of a concave disk, having shrunk upon the perimeter thereof a grooved ring or tire, substantially as shown and described.

Fourth, in combination with the reel the fuel boxes arranged on each side thereof, and under the frame of each box, having a discharge opening and a gate in its bottom, substantially as set forth.

65,635.—CHRISTOPHER BECKER, Flint, Mich.—*Brick Press.*—June 11, 1867.—Three sides of the mold are movable; one is formed by the horizontal presser, one by the movable top, and the lower one by the plunger, which rises to eject the brick when the cover is removed. The movable portions are actuated by levers, and the action is alternate in the two molds.

Claim.—A brick press, consisting of a combination of the box A, block B, plungers D D', and sliding covers H H', with each other, and with a suitable mechanism for operating the same, all made substantially as herein shown and described, and operating in such a manner that the bricks are pressed alternately in the molds G G', as set forth.

65,636.—MYRON H. BECKWORTH, Camden, N. Y.—*Corset.*—June 11, 1867.—The parts of the corset are sewed together by a seam which encircles the waist, and the seam is strengthened by a belt.

Claim.—A belt applied over and upon the seam around the waist part of the corsets, substantially as and for the purposes set forth.

65,637.—E. L. BOLSTER, Waterbury, Conn.—*Blacking Dish and Knife.*—June 11, 1867.—The sharpened end of the handle affords a cutting edge for stove blacking, &c., and the fragments fall into the dish.

Claim.—A dish provided with a knife or cutter blade, substantially as and for the purpose described.

65,638.—PETER BROADBOOKS, Batavia, N. Y.—*Wire Cutting Pincers.*—June 11, 1867.—The jaws are closed by the motion of the leg, which is shackled to the head of the stationary jaw, and presses by a knuckle joint upon the head of the movable one.

Claim.—The legs *b b'* and spring *d*, secured together by means of the rectangular collar *a* fitting over and working upon the heads *c c* of the legs *b b'* and spring *d*, the latter connected to the leg *b'* by means of the knuckle joint composed of the knuckle *g* and socket *h*, all constructed and arranged substantially as described for the purpose specified.

65,639.—GEORGE BROWN, EDWARD E. BURNHAM, and JOHN MORRISSE, Gloucester, Mass.—*Metallic Surface Coating Composition.*—June 11, 1867.—To protect from atmospheric influences and oxidation. Composed of rosin, 200; carbonate of lime, 300; linseed oil, 20; native oxide of copper, 5; sulphuric acid, 5 parts. For use, dissolve in naphtha.

Claim.—The composition made substantially in manner and of the ingredients set forth, and especially its combination with naphtha or the equivalents thereof, the whole being substantially as and for the purpose as hereinbefore specified.

65,640.—HENRY BUEHLER, New York, N. Y.—*Divan and Bed.*—June 11, 1867.—The back is lowered to form a head piece, and is supported by a hinged leg; when raised it is sustained by a bolt. The seat folds over forward and exposes two sections, which compose the body of the bedstead.

Claim.—A divan constructed substantially in its seat and back portions so as to be used and adjusted substantially as described for the purposes specified.

65,641.—L. BURNS, Portchester, N. Y., assignor to himself and JOSIAH WILCOX, same place.—*Dies for Forming Thill Couplings.*—June 11, 1867.—The coupling is formed of one piece by swaging it from a blank in a succession of dies, which form the tail piece and also the ears between which the thill iron is fastened by a bolt.

Claim.—First, the thill coupling constructed as described, by swaging the blank A in the dies D E and M N, as herein shown and described for the purpose specified.

Second, the dies D E, provided with the holes F and opening H, the dies M N, with equal shoulders L, all constructed as described for the purpose of forming the thill coupling, substantially as herein set forth.

65,642.—WILLIAM BUTCHER, JR., Sheffield, England, and THOMAS SHAW, Philadelphia, Pa.—*Forming Wheels, Tires, &c., by Castings.*—June 11, 1867.—The metal is cast in a revolving mold, which purifies the metals of their gases and brings the atoms in proper relation in respect to their affinities, making it more homogeneous. The metal is rubbed and wrought until its inertia is overcome, and then consolidated by the centrifugal pressure.

Claim.—First, the method of forming tires, wheels, and other articles of metal by casting, supporting the mold while the melted metal is being poured into it, upon being unconfined to a revolving disk, substantially as and for the purposes specified.

Second, in combination with a mold and revolving disk as set forth in the foregoing clause, the two rings *h* and *i*, or their equivalents, substantially as and for the purposes specified.

65,643.—JULES ALFRED CHAUFOURIER, Paris, France.—*Cotton Gin.*—June 11, 1867.—The cotton is fed automatically by oscillating combs operated by an eccentric rod. The bellows is actuated by an eccentric on the main shaft. Further explained by the claims.

Claim.—First, the self-feeding apparatus, consisting of the racks or combs *k*, N, and P, and the manner of operating the same, substantially as shown and described.

Second, the self-operating refrigerator or bellows I, for the purpose of conducting a current of air towards the driving or carrying cylinder H, substantially as herein shown and described.

Third, one or more supporting cylinders R, for the purpose of preventing a deflection of the shelling cylinders, substantially as herein shown and described.

65,644.—DOMINICO CHEEKINI, Brooklyn, N. Y.—*Toy Rope Dancer.*—June 11, 1867; antedated June 5, 1867.—The thumb knob in front of the platform is attached to a lever beneath, which is connected by a cord to the figure, so that the rapid depressions of the thumb knob cause the figure to dance.

Claim.—The lever E, the bells H, the rope D, and the figure I, or its equivalent, in combination with the cross trees B B and platform A, substantially as and for the purposes described and set forth.

65,645.—CHARLES B. CLARK, Buffalo, N. Y.—*Sash Lock.*—June 11, 1867.—Improvement on the patent of E. L. Ferguson, No. 59,505. The rollers are manipulated by pins which slide in guide slots of the case, which is attached to the sash face.

Claim.—First, the combination of the eccentric roller D, for sustaining the sash, with the weighted roller F and case C, for holding the sash up and locking the same down, substantially as described.

Second, in combination with the eccentric roller D the hollow cylindrical stud E, forming a portion of the case and receiving the screw c, arranged substantially as and for the purposes set forth.

65,646.—RICHARD COLBURN, Norwich, Conn.—*Steam Trap.*—June 11, 1867.—Explained by the claims and illustration.

Claim.—The arrangement of the valve, its case, and induction and ejection passages, substantially in manner as described, in order that the valve when in use with a cylinder and piston, as explained, will be closed by the pressure of steam, and when relieved therefrom will be opened by its own weight, the whole being in manner and under circumstances as explained.

Also, the combination of the screw I, or its equivalent, with the valve, its seat, chamber, and induction and ejection passages, arranged substantially as explained.

65,647.—J. A. COX, Humboldt, Tenn.—*Cotton Seed Planter.*—June 11, 1867.—The coulters and opener precede the drill spout, which is flanked by the harrow teeth and succeeded by the concave-edged coverer.

Claim.—First, the combination with a seed box E and hopper F of the coulters C and opener D, substantially as and for the purpose set forth.

Second, the combination with the coulters C and opener D of two harrow teeth J J, substantially as and for the purpose specified.

Third, the combination with the opener D and hopper F of the coverer I, substantially as and for the purposes herein above set forth.

65,648.—S. F. CRAIG, Eddyville, Iowa.—*Well Tube.*—June 11, 1867.—Explained by the claim. The air passage in the point is to allow flow of air beneath it on retraction.

Claim.—The combination and arrangement of the perforated end A of the well tube, around which the wire screen or gauze B is placed, point D secured to the end of said tube, forming the chamber E, and air passage G, as herein set forth, for the purpose specified.

65,649.—GEORGE H. CROSS, Montpelier, Vt.—*Rotary Dough Dresser.*—June 11, 1867.—The rotary brush removes the flour from the surface of the rolled dough, preparatory to cutting up.

Claim.—The revolving brush A upon the shaft b b, in combination with the box B, adapted for dressing dough to prepare it for the manufacture of crackers, as herein shown and described.

65,650.—J. E. CROWELL, Chelsea, Mass.—*Spinning Frame.*—June 11, 1867.—Drawing rolls are placed within the flyers to receive the sliver directly from the spool producing the draw and twist thereof without intervention of drawing rolls. The threads

are in contact with a bar, which prevents the twist from running back to the spool.

Claim.—In combination with the flyer of a spinning frame, drawing rolls arranged within the flyers, when one of said rolls in each flyer is directly upon the spindle and meshes into and drives the others, substantially as shown and described.

Also, combining with the drawing rolls and the flyer of a spinning frame a detainer bar, interposed between the drawing and twisting mechanism and the delivery rolls, substantially as and for the purpose described.

65,651.—GEORGE C. DAVIES, Dayton, Ohio, assignor to the DAVIES SCREW COMPANY, same place.—*Wood Screw.*—June 11, 1867.—The shank is a lengthened conoid and the general outside form of the thread portion of the screw is of a more convex conoidal form; the depth of thread increases from its butt end to near the point.

Claim.—First, making wood screws with a tapering core from neck to point, with threads of equal pitch and external diameter, but of gradually but more rapidly increasing depth from the base to near the apex of the said core, where they again diminish and die out into a central point.

Second, making wood screws with a core tapering from its base to its point, with threads of equal pitch and external diameter, but of gradually increasing depth from its base to near the point where it again diminishes and dies out, in combination with a shank with parallel sides or tapered form about its centre, where it joins the core, substantially as set forth.

65,652.—ADOLPH DELKESAMP, Brooklyn, N. Y., assignor to JOHN A. NEWBOULD, New York, N. Y.—*Machine for Making Clasps for Hoop Skirts.*—June 11, 1867.—The blank is punched out, and, dropping through the die, is forwarded to a reciprocating bar, by which it is bent to form.

Claim.—The swinging bending bar o, in combination with the slide i, dies d and n, and punch e, substantially as and for the purposes set forth.

65,653.—WILLIAM L. DEWEY, Bridgeport, Conn.—*Napkin Holder.*—June 11, 1867.—Explained by the claim and illustration.

Claim.—As a new article of manufacture, a napkin holder, constructed as described, consisting of the pedestal A, into which are screwed or riveted spring arms B in one piece, and forming nearly a circle, with their ends bent over at D, as herein shown and described.

65,654.—GEORGE DOWLING, Fair Haven, Conn.—*Compasses used in Calking Seams.*—June 11, 1867.—The additional leg is pivoted to a pin attached to one of the main legs, and is adjusted by a thumb nut on a curved screw rod projecting from the same.

Claim.—In combination with the compass A, the additional or adjustable leg f and adjusting arc d, when constructed and operating substantially as described.

65,655.—JAMES C. DUVOLL, Sardis, Miss.—*Cotton Press.*—June 11, 1867.—The press is operated by horse-power, the falling and rising of the follower being attained by reversing the direction of the revolution of the sweep of the horse-power whose ropes wind upon the wheel. The follower is depressed by ropes at its ends, which are wound upon the shaft beneath as the power revolves, and are raised by another rope which passes to another portion of the shaft.

Claim.—Operating the follower or plate H, through which the medium of the ropes E I K, applied in connection with the wheel and shaft C D and the capstan F, all arranged to operate in the manner substantially as and for the purpose set forth.

65,656.—S. P. DYER, Prairie Depot, Ohio.—*Evaporating Pan.*—June 11, 1867.—Foraminous skimmer plates are pivoted over the receiving pan and are operated by levers. This pan discharges through the perforations of a plate dividing it from the other partitions. The sirup runs through a strainer-plate in entering the last pan of the series. The dampers are so arranged beneath the pan that the middle portion, or the finishing pan, may have the caloric current turned from contact with their bottoms.

Claim.—First, the skimmers C, constructed, arranged, and operated substantially as herein shown and described, and for the purpose set forth.

Second, the combination and arrangement of the strainer G, gates H R S T, and operating levers I L M N with the partitions G U V M of the pan, substantially as herein shown and described and for the purpose set forth.

Third, the combination of the stationary strainer A' with the finishing pan X, substantially as herein shown and described and for the purpose set forth.

Fourth, the arrangement of the dampers G' H' I' and flue partitions E' F' with each other, substantially as herein shown and described and for the purpose set forth.

65,657.—CHARLES JAMES EAMES, New York, N. Y.—*Preventing Incrustation in Steam Boilers.*—June 11, 1867.—The water is filtered successively through a stratum of carbonate of barytes, oxalate of barytes, and animal charcoal or other ordinary filter. The effect is a double decomposition of the sulphate and carbonate of lime, which renders them insoluble and removable by precipitation.

Claim.—The mode of preventing the incrustation in steam boilers substantially as herein described.

65,658.—EDWARD P. EASTWICK, Baltimore, Md.—*Manufacture of Refined Sugar.*—June 11, 1867.—The object is not to discharge from the magma the semi-fluid portion, to leave a residue of crystallized sugar, but the sugar is moistened by successive additions of water, which dissolve it by degrees, the solution obtained at each step of the process being removed by the centrifugal machine and conducted to a separate tank, to be converted by the ordinary process into such a grade of sugar as its quality permits.

Claim.—The mode, substantially as herein described, of obtaining from sugar of one quality solutions of different qualities for the purpose specified.

65,659.—N. EYINGER, Sandford, Ind.—*Road Scraper.*—June 11, 1867.—A team is attached to the plow, and a horse before the frame of the scraper, which extends obliquely in the rear of the plow, to remove the dirt thrown up by the latter. The draft power is attached to the fore carriage, to which the plow and scraper are each connected.

Claim.—First, the combination and arrangement of the scraper-plate A, beams C, chains D, draft bar E, and connecting bar L with an ordinary plow N, substantially as herein shown and described.

Second, the combination of the pivoted arm H and castor wheel G with the beam C, substantially in the manner herein shown and described and for the purpose set forth.

Third, the combination of the lever R with the plow beam m' and draft bar E, substantially as herein shown and described and for the purpose set forth.

65,660.—W. P. FORD and A. A. MOORE, Concord, N. H.—*Composition for Pavements.*—June 11, 1867.—Into a tank containing a mixture of 3 parts gravel and 1 part cinders pour a composition of 25 parts melted resin and 40 parts coal tar, to cover the said gravel. Mix and spread over a suitable foundation; sift on coal dust and roll.

Claim.—A composition for pavements, &c., made up of the specific ingredients combined together, substantially as set forth.

65,661.—A. FROST, Seymour, Ind.—*Animal Trap.*—June 11, 1867.—The weight of the animal on the platform releases the lever from the slot, and the doors close. The animal escapes through the hole into the secured chamber and, in raising the wire door, resets the trap.

Claim.—First, the plate levers a a', constructed and arranged so as to open or close simultaneously the doors b b', substantially as set forth.

Second, the doors b b', provided with loops i i, in combination with levers a a', as and for the purpose set forth.

Third, the spring platform or treadle d, provided with a slot o for engaging with the lever a', as and for the purpose described.

65,662.—O. S. GARRETSON, Buffalo, N. Y.—*Mop Head.*—June 11, 1867.—The revolution of the nut on

the screw moves the cross-head and jaw frame relatively.

Claim.—The jaw frame and socket C D, composed of a single piece of malleable metal, in combination with the cross-head B and screw shank A, or its equivalent, when said jaw and socket have a reciprocating movement in consequence of the revolving of the socket, or of a nut connected therewith, or of the screw within the same, substantially as herein described.

65,663.—AMOS D. GEORGE, Mass.—*Scarf Supporter.*—June 11, 1867.—The two horns that tuck beneath the collar are elastic so as to enable them to be drawn back to enter the fold at its front edge; the tie is supported by the elastic connecting band which unites the ends of the horns.

Claim.—A scarf or neck-tie supporter, constructed to operate substantially as set forth.

65,664.—J. J. GILBERT, Little Falls, N. Y.—*Manufacture of Starch.*—June 11, 1867.—The prepared grain and water passes to the vibrating separator which has a sieve of bolting cloth; from thence it is received in a settling vat. The water is decanted and caustic alkali added, 60 pounds to the result of 60 bushels of corn in 1,000 gallons of water. The contents of the vat are agitated and pumped into the depositor, in which it follows a sinuous descending course, the starch depositing, and the gluten dissolved by the alkali passing off. The starch is again mixed with water and agitated, settled, and drained.

Claim.—First, the separator D, constructed and arranged substantially as herein shown and described for the purposes set forth.

Second, the depositor H, constructed substantially as described for the purposes set forth.

Third, in combination with the separator the vats arranged substantially as described and for the method herein described of manufacturing starch.

65,665.—WM. SMITH HALL, Quincy, Mass.—*Treadle Mechanism for Sewing Machines.*—June 11, 1867.—The treadles operate levers whose spring pawls engage a ratchet wheel alternately, and cause a continuous rotation of the same.

Claim.—Combining a machine shaft with a treadle by a ratchet, pawl-lever, and connecting rod, arranged to operate together substantially as described.

Also the double sets of treadle levers, pawl levers, pawls, and ratchets, arranged to operate both independently or in conjunction substantially as set forth.

65,666.—R. HAMMILL, Mineral Point, Wis.—*Extension Horse.*—June 11, 1867.—Adapted for supporting scaffolding. It can be raised, lowered, lengthened, or folded.

Claim.—First, the manner of attaching the folding legs A A to the beam B of a horse or trestle by means of slotted pins b, staples c, and keys d, all made and operating substantially as herein shown and described.

Second, the extension beam B, in combination with the legs A D, all made and operating substantially as herein shown and described.

Third, the braces C and E, in combination with the legs A and beam B, made so as to be folded to the beam and legs if desired as set forth.

Fourth, connecting and supporting the inner ends of the two halves of the extension beam B, by means of bands a and a tongue h, which is provided with pins i i, and which is confined in grooves g between stops k substantially as set forth.

Fifth, an extension and folding horse or trestle made and operating substantially as herein shown and described.

65,667.—S. T. HARKER, Milwaukee, Wis.—*Steam Heating Apparatus.*—June 11, 1867.—Explained by the claim and illustration.

Claim.—A steam heating apparatus consisting of fire chambers A, with coil C, on three sides, water and steam dome B on the fire chamber, with a smoke passage through it large at the bottom and contracted at the top, and both ends of the coil C entering the dome below the water line, all arranged and combined substantially as described.

65,668.—HARVEY J. HARWOOD, Utica, N. Y.—*Wood Screw.*—June 11, 1867.—The thread is carried forward in advance of the central part to form cutting wings.

Claim.—First, forming the end of the screw into a lip or lips, substantially as described.

Second, extending the lip or lips of the screws beyond the terminus of the core, substantially as described.

Third, retaining the full size of the screw at the point without continuing the core to the point.

Fourth, increasing the pitch between the lip and first thread, substantially as described.

65,669.—HENRY HAFENPFLUG, Huntington, Pa., assignor to himself and EDWARD HAFENPFLUG.—*Sewing Machine.*—June 11, 1867.—Motion is imparted to the saw sash by side rod, actuated by a shaft beneath. The carriage is fed by a rock shaft and system of connections between a pawl which engages a ratchet on the carriage and a rotating slotted lever attached radially to the driving shaft. The shaft if desired may be reciprocated by connection to the rock shaft.

Claim.—The arrangement of the lever *m*, plate *n*, shaft *i*, levers *j k* and *l*, by which motion is imparted from the shaft *C* to the reciprocating frame *G*, as herein set forth for the purpose specified.

65,670.—JOEL HEACOCK, Marlboro, Ohio.—*Field Fence.*—June 11, 1867.—The brace is attached to the sill and to the butted ends of the next rail to the top on each panel, its upper end engaged in a notch of the top rail. The panels stand on the sills, their ends lapping past each other.

Claim.—The combination and arrangement herein described of the rails *A A*, battens *B B*, braces *C*, and sill *D*, when all are constructed of the ordinary split rails to form the panels of a field fence, substantially in the manner and for the purpose set forth as described.

65,671.—HERRMAN HEMPEL, New York, N. Y.—*Button-hole Cutter.*—June 11, 1867.—The block is moved longitudinally on the jaw according to the length of cut required.

Claim.—The sliding block *D*, when secured to the jaw *d*, by means of straps *g g*, and when held in position by a spring catch *h*, fitting into one of a series of holes arranged on one side of the jaw *d*, all as set forth.

65,672.—F. L. HILBRIGHT and F. REYNOLD, Newark, N. J.—*Rosette.*—June 11, 1867.—Explained by the claim and illustration.

Claim.—The die *A*, consisting of the part *B* fixed to the flanged rod, the part *C* hinged to the part *B*, their pieces in contact with each other, constructed to receive and hold the metallic loop of rosettes, said die *A* being brought down upon the rosette in the lower die, and uniting the loop thereto, as herein set forth for the purpose specified.

65,673.—R. M. HOLLAND and A. J. HIBBS, Philadelphia, Pa.—*Elastic Frame for Mosquito Bar Netting.*—June 11, 1867.—The radial spring bars are attached to the corners of the marginal tapes to extend the same.

Claim.—The socket pieces *A A*, with their enclosed springs *B*, together supporting the stems *C C C*, classically, in combination with the listing *D*, or its equivalent, for holding the mosquito netting *E*, the said parts being constructed and arranged to operate together, substantially as and for the purpose described.

65,674.—H. L. HOUGHTON, Morrison, Ill.—*Composition for Hardening and Preserving Wood.*—June 11, 1867.—Equal parts of saltpetre, alum, and sulphate of iron, dissolved in water.

Claim.—A wood-preserving composition formed of the ingredients herein named, and in about the proportions mentioned, and applied to wood, substantially as herein described.

65,675.—WILLIAM WHEELER HUBBELL and JAMES M. PATTON, Philadelphia, Pa.—*Quartz Mill.*—June 11, 1867.—The ore is broken and thrown into the hopper, and passes between the vertical con-

pound wheel of the hopper and the concave, which is formed of segmental blocks. From thence it passes to the final reducing stones.

Claim.—First, the edged toothed sections or plates *p*, firmly bolted and fitted to the rectangular surfaces or corners of the pot, and used in combination with the central revolving nuts, diminishing in their size and increasing in their number of teeth downward towards the bottom of the pot, substantially as described.

Second, discharging the ground quartz from the bottom of the pot *e* into the inclined conduit, by means of the arm *n* attached to the rim or collar *m*, and below the teeth *l* and plates *p*, substantially as described.

Third, the series of circular movable toothed sections or nuts above each other vertically, the teeth of the separate nuts diminishing in size, but increasing in number as they are placed one below the other when used in combination with the interior vertical toothed plates *p* within the pot, constructed and operating substantially as described.

Fourth, the furrows in the stones cut in two distinct series, the inner series upon radial lines extending outward to or near the half diameter of the stone, the outer series in toward the centre, on lines tangential to the inner furrows, and entirely separate and distinct from each other, with a plain attrition or uncut face between them, substantially as described.

Fifth, in a mill for grinding quartz, the combination of the elevated pot *e*, with its plates and nuts, arms *n*, aperture *z*, inclined conduit *l*, and the lower stones *y z*, constructed, proportioned, and operating substantially as described.

Sixth, the removable steel cup or shoe *19*, constructed, applied and used between the vertical shaft and removable step *21*, in the manner and for this purpose as described.

65,676.—A. JAMESON, Trenton, N. J., assignor to himself, T. S. MURRAY, and J. H. MURRAY, same place.—*Screw Box for Vises.*—June 11, 1867.—Two tubes of varying diameter are united by a collar piece and the parts welded together on a former mandrel; the feather and cascabel are added, and the screw is cut in the smaller tube.

Claim.—The method, substantially as above described, of making screw boxes for vises.

65,677.—JOHN JOHNSON, Saco, Maine, and R. C. OVERTON, New York.—*Disintegrating Rocks.*—June 11, 1867.—Air, steam, and a hydrocarbon vapor are forced in a stream against the rock to be heated; a stream of cold water is then dashed against it, the rapid change of temperature disintegrating the rock.

Claim.—Liquid and gaseous hydro-carbon and air, or air and steam, as fuel, for the purpose herein set forth, and when employed with the agents for the reduction of temperature, substantially as specified.

65,678.—G. B. KEELER, Greenwich, Conn.—*Wrench.*—June 11, 1867.—The handle has an adjustable spring-hook, which clasps the pipe against the notches as the wrench is rotated.

Claim.—The shank or bar *A*, notched at one end, in combination with the adjustable spring-hook *F*, substantially as and for the purpose described.

65,679.—DENNIS A. KELLOGG, Valparaiso, Ind.—*Wrench.*—June 11, 1867.—The slots in the nuts are made by cutting out the threads wide enough to allow the narrow edges of the main bar to pass. The sliding jaw has two threaded segments that fit on the wide sides of the bar. By turning the slots of the nut to the narrow side of the bar, the jaw is slipped to place, and when the threads of the nut engage those of the bar and the segments of the jaw, the latter is tightened against the object.

Claim.—A wrench constructed, arranged, and operating as and for the purpose herein set forth.

65,680.—PATRICK KENNEDY, New York, N. Y.—*Cement for Fixing Door Knobs, &c.*—June 11, 1867.—For securing door knobs to shanks, and similar purposes. Composed of alum, 2 parts; coppers, 1; fine white sand, 1; water, 4; boiled to consistency of gruel.

Claim.—A cement composed of the ingredients substantially in the manner herein set forth.

65,681.—GARRET C. LANSING and JOHN G. OSTROM, Rhinebeck, N. Y.—*Wagon Spring.*—June 11, 1867.—Explained by the claim and illustration.

Claim.—The flat wooden springs *a a' a''*, &c., when arranged in pairs, each pair at right angles across the other, substantially as and for the purpose herein shown and described.

65,682.—RUFUS LAPHAM, New York, N. Y.—*Automatic Fire Extinguisher.*—June 11, 1867.—The expansion of mercury causes it to reach a wire whose integrity is destroyed by the contact, and thus the alarm is given. The release of the wire also mixes chemicals which generate carbonic acid gas to extinguish the fire.

Claim.—First, the application of the expansion of mercury by the heat produced by the breaking out of a fire in a room to cause an alarm to be given.

Second, the application of the expansion of mercury by the heat produced by the breaking out of a fire in a room, to cause chemicals that produce carbonic acid gas to be brought together for the purpose set forth.

Third, the application of the expansion of mercury by the heat produced by the breaking out of a fire in a room, to cause a cock or its equivalent to open for the purpose of letting in an extinguisher agent kept in reserve.

Fourth, the application of the expansion of mercury by the heat produced by the breaking out of a fire in a room, to sever a wire or its equivalent with which mercury readily amalgamates for the purposes set forth.

Fifth, generally for all purposes to which it is adapted, arranging a wire or its equivalent with which mercury readily amalgamates, in such a relation to the mercury that when expanded by heat it shall unite with said wire or its equivalent, and cause it to be separated.

65,683.—THEODOR LUKE, St. Louis, Mo.—*Carpet Cleaner.*—June 11, 1867.—The carpet passes over a roller, being moved and wound on a windlass, and is exposed as it traverses to rotary beaters and a revolving brush.

Claim.—The combination of the frame *b b*, shaft *a*, revolving arms *h*, rotary brush *e*, and windlass *k*, as herein described and for the purpose specified.

65,684.—ALEXANDER MOON, Maquoketa, Iowa.—*Pump.*—June 11, 1867.—The barrel is vertically reciprocated in the well and has also a reciprocating piston. The barrel and piston both discharge through tubular pump stocks, having valves at their lower ends.

Claim.—The combination of the pumping cylinder or barrel *A*, plunger *C*, and tubes *D* and *J*, when all constructed with valves and arranged together so as to operate substantially as and for the purpose described.

65,685.—H. C. MOORE, Springfield, Mass., assignor to himself and CHAS. ROBINSON, same place.—*Skate.*—June 11, 1867.—The shanks of the sole clamps are notched, so as to engage each other beneath the sole plate, in which position they are fastened by set screws. The shank of the heel clamp is held by notches which engage corresponding ones in the heel plate. A notched eccentric clamps against the front of the heel.

Claim.—The hook notches *l l* in the adjacent edges of the flanches of the toe clamps, in combination with the thumb screw *S* which holds the flanches together, substantially as and for the purpose specified.

Also, the combination of the hook notches *f f* in the edges of the flanch of the heel clamp, the corresponding notched opening in the heel plate *D*, the bolt *g*, and nut *t*, substantially as and for the purpose herein specified.

Also, the notched eccentric *G*, with its handle *p*, turning up and down under the foot, and arranged so that it tightens more securely as the heel tends to work out, substantially as herein specified.

65,686.—J. S. MUNGER, Olean, N. Y.—*Carpet Stretcher and Holder.*—June 11, 1867.—The holding

strip has hooks which catch in the carpet, and while the claws of the pointed dogs are stuck in the floor at a distance, the other ends of the dogs engage the strip and hold it in position to strain the carpet into place.

Claim.—First, the pointed dogs *B*, adapted for use in the operation of stretching carpets, and constructed substantially as described.

Second, the combination of hooked holding plates *A* with curved dogs *B*, substantially as described.

65,687.—JAMES NEALE, Trenton, N. J., assignor to himself and MATHEW T. HIGGINS, New York, N. Y.—*Saw.*—June 11, 1867.—The back of the tooth is grooved and fits in a counterpart ridge on one side of the socket. The front edge of the tooth is reduced in thickness and its dovetailed edge occupies one face of the ridge, while the clamping plate fills the hiatus in the tooth and is secured thereto, fitting against the other face of the ridge on the saw plate.

Claim.—A saw tooth, formed with a dovetailed base and grooved back, setting within the recess of the saw plate and secured by the clamping plate *D* within a recess at the front portion of the base of the tooth, in the manner set forth.

65,688.—RACHEL NEWCOMB, South Brooklyn, N. Y.—*Liniment.*—June 11, 1867.—Composed of alcohol, 1 pint; and 1 oz. each of oil of spearmint, oil of thyme, oil of rosemary, oil of saffras, laudanum, tincture of cayenne, spirits of hartshorn, camphor gum, and oil of pennyroyal.

Claim.—The liniment, made of the ingredients mixed together in and about the proportions herein above described,

65,689.—W. H. NICHOLS, East Hampton, Conn.—*Sleigh Bell.*—June 11, 1867.—The attaching staple is fixed in the mold and the bell cast on to it.

Claim.—Casting a shank of two or more or less pins *a*, in and with the sleigh bell *A*, substantially as and for the purposes herein shown and described.

65,690.—HIRAM PARKS, Athens, N. Y.—*Pump.*—June 11, 1867.—The pump rod is attached to a bell crank that is operated by a wire from a distance, passing around bends in its course. Draft on the wire raises the piston, which is depressed by a weight attached.

Claim.—The arrangement of the pump *A*, sinker *H*, piston rod *B*, crank or elbow pieces *C C*, wires or rods *D*, and lever *E*, as herein described, operating as and for the purpose specified.

65,691.—JOSEPH THOMAS PARLOUR, Brooklyn, N. Y.—*Keel Block or Rest.*—June 11, 1867.—The keel is supported on a block, limited to vertical movement and adjustable by a wedge block held by a pawl and rack, and moved by ropes and pulleys.

Claim.—First, a block or support for the keel of a vessel, &c., when made in separate parts or sections, constructed and arranged together, so as to be operated substantially as and for the purpose described.

Second, the upper or cap section *B* of a keel block, so arranged that as it is raised or lowered it will move and be guided in a vertical plane or direction, substantially as described.

65,692.—WM. G. PERKINS, Walden, Vt.—*Rolling Screen for Doors, Windows, &c.*—June 11, 1867.—The respective edges of the slats are convex and concave and present no visible fissures, while they roll on each other as they wind on the shaft, to which they are connected by suspending straps.

Claim.—The winding screen, made up of slats with edges as described, when arranged on suspensories, as specified.

65,693.—H. G. POPE and H. F. HERRICK, New Berlin, N. Y.—*Medical Compound.*—June 11, 1867.—For the cure of spavin, &c. Composed of tallow, 4 oz.; lard, 4 oz.; oil of origanum, $\frac{1}{2}$ oz.; oil of lavender, $\frac{1}{2}$ oz.; cantharides, $\frac{1}{2}$ oz.; iodine ointment, $1\frac{1}{2}$ oz.; blue mass, 1 oz.; protochloride of mercury, 15 grs.; and extract of logwood, to color the compound.

Claim.—A medical compound, made of the ingredients mixed together in and about the proportions, substantially as and for the purpose described.

65,694.—ESEK C. ROBERTS, Salem, Mich.—*Fence.*—June 11, 1867.—The rail ends are built upon each other and supported by vertical stakes planted on each side. Inclined stakes rest against the fence and support at their intersection the lower rider; the upper rider rests between the vertical and inclined stakes.

Claim.—The combination of the top rails or riders E with the stakes B and C, substantially in the manner herein shown and described and for the purpose set forth.

65,695.—JOHN P. SCUDDER, Lawtenceville, N. J.—*Potato Planter.*—June 11, 1867.—The potatoes pass by an adjustable opening into the inclined wheel and are raised by revolving scoops and dropped into the furrow in the rear of the share.

Claim.—First, the inclined cylinder E, in combination with the revolving scoops *g*, and adjustable valve H, all made and operating substantially as herein shown and described.

Second, the hopper N, and gate *h*, in combination with the inclined cylinder E, scoop *g*, and valve H, all made and operating substantially as herein shown and described.

Third, the adjustable plow J, in combination with the inclined cylinder, scoops *g* and valve H, all made and operating substantially as herein shown and described.

65,696.—EDWARD SHAW, Portland, Me.—*Lamp Extinguisher.*—June 11, 1867.—A strip of metal, bent to fit the cone, is hinged so as to swing up and cover the flame slot.

Claim.—The curved extinguisher for lamp, of the kind described, when constructed and applied as and for the purposes set forth.

65,697.—J. W. SHIRLEY and WILLIAM H. FASIG, Terre Haute, Ind.—*Steam Engine Governor.*—June 11, 1867.—The governor stem has inclined wings to move it longitudinally against the pressure of a spring.

Claim.—The wind wheel A, the shaft B, and the spring F, arranged and operating substantially as herein shown and described for the purposes set forth.

65,698.—JACOB SILVINS and WILLIAM T. HAIN, Sunbury, Pa.—*Lantern Lamp.*—June 11, 1867.—The curved arm is oscillated above the wick tube to remove the crust of the wick. The arm is in the rear of a shaft which passes through a tube in the reservoir and is operated by a knurled head below the lamp bottom.

Claim.—The crust remover *g*, on the upper end of a vertical shaft E, which passes through a tube F, in the lamp, substantially as and for the purpose specified.

65,699.—P. L. SLAYTON, New York, N. Y., assignor to himself and ALMET REED, same place.—*Apparatus for Tempering Wire.*—June 11, 1867.—The wires are placed between the converging edges of radially adjustable bars, which are heated by jets of gas.

Claim.—First, the radially adjustable strips or bars E, arranged between the guide bars C, and provided with holes or gas passages *c*, communicating with recesses *e*, in the guide-bars C, all arranged substantially in the manner as and for the purpose set forth.

Second, the central passage formed by the strips or bars E, of such a size as to receive the wire to be tempered, and to permit a current of air to pass to the gas jets, and this whether said strips E are adjustable or stationary.

65,700.—WILLIAM SLOAN, Highland, Iowa.—*Sleigh Brake.*—June 11, 1867.—The spurs of the brake are pivoted to and operate on each side of the runner; they are brought into operation by a lever handle and prevented from passing beyond the vertical by the prong which collides with the runner.

Claim.—First, the jaws E, pivoted to and straddling the runner A, prong G, and handle F, when constructed and arranged as herein set forth for the purpose specified.

Second, attaching an arm or prong G to the brake E F, substantially as herein shown and described and for the purpose set forth.

65,701.—SHERMAN SMITH, Presque Isle, Me.—*Window Sash Fastener.*—June 11, 1867.—The upper sash has a bar which slides in a band and is engaged by a thumb-screw. The lower sash has a spur-wheel which engages a rack-bar attached to the frame and by which it is adjusted.

Claim.—the combination of the bar *a*, the rack *c*, and the thumb-screw *d*, the wheel *g*, on the plate *e*, and the catch-rod *v'*, arranged and operating as and for the purpose specified.

65,702.—W. C. SMITH, Warrensburgh, Mo.—*Sugar Evaporator.*—June 11, 1867.—The fire chamber is beneath the highest pan, which is the nearest to the chimney. Dampers allow the direct communication of the fire-space and the chimney, or the caloric current may be forced under the centre of two, or all the pans, and under the sides of the same to the chimney. A cooling pan beneath the flues is connected by a pipe to the lower pan of the series.

Claim.—The pans F G H, arranged at different heights on the body A of the device, when used in combination with the flues J J' J'', dampers M M N O O, arranged relatively with the smoke-stack K and fire-box B, substantially as and for the purpose set forth.

Also, the adjustable wheels C C, and folding legs or supports D D, when used in combination with or applied to a sugar evaporator, substantially as and for the purpose specified.

65,703.—WILLIAM W. SPALDING, Greenland, Mich.—*Jigging Machine for Dressing Ores.*—June 11, 1867.—The pulverized ore falls on to a sieve, where it is agitated by a rake, in water which is caused to pulsate by an intermittent plunger. The small and heavy particles fall through and are sorted by an opposing stream of water; the heavy and larger fall into a ragging box and the light are washed off.

Claim.—First, the main box A, in combination with the plunger box B, having a water passage or throat *a* connecting them, and divided into two compartments with the water passage *d* between them and the discharge pipes *e e'* leading from them, arranged and operating substantially as and for the purposes herein described.

Second, the plunger C, pivoted or hinged at one side, in combination with the box B, the main box A, and the sieve *b*, arranged and operating substantially as and for the purposes specified.

Third, the combination of the closed ragging box E, attached to the front side of the main box A, the self-regulating gate *p*, and the guard F, constructed, arranged and operating substantially as and for the purposes set forth.

Fourth, the rake *k*, in combination with the counter-shaft *l*, the crank shaft *h*, and the sieve *b*, arranged and operating as and for the purpose described.

Fifth, the combination and arrangement of the main box A, the plunger box B, the plunger C, the bail *g*, the apron D, the rake *k*, the guard F, the gate *p*, and the ragging box E, substantially as and for the purposes herein described.

65,704.—R. E. STEPHENS, Owen Sound, Canada.—*Breach-loading Fire-arm.*—June 11, 1867.—The action of cocking throws open the breech and dislodges the shell simultaneously. The breech opens to the right by the leverage of the cam on the spiral-shaped shoulder on the connecting rod. The cartridge being inserted the thumb-bit is compressed, the breech block is shut and secured by the latch.

Claim.—First, the construction and manner of operation in a breach-loading fire-arm of the hammer C, in combination with the cam rod G, working by the double link M.

Second, the construction of the extractor in two parts or sections E F, in combination with the cam rod and springs J S and X.

Third, the combination of the latch O, and its operation automatically, and by the spring *z*, and cam rod.

Fourth, the tripping box I, and its notched key H, operating therein in combination with the cam rod.

Fifth, the cam P, in combination with the spiral-shaped shoulder Q, on the connecting rod R, and working by the cam rod, in combination with the double link and hammer or its equivalent.

Sixth, the combination of the connecting rod R with the thumb-bit D and breech block A, and the spiral springs J S and X, operating substantially as described and for the purpose set forth.

65,705.—LEVI STEVENS, Fitchburg, Mass.—*Apparatus for Treating Air and Hydrocarbon Vapor for Illuminating Gas.*—June 11, 1867.—The float is an inverted vessel, whose edges are submerged in the water between the two cylinders. Air or gas is forced into the machine, and the raising of the float, when charged, shuts the valve. The gas passes through an involute chamber, and is exposed to alcohol and lime.

Claim.—The apparatus for treating air and hydrocarbon vapor for illuminating gas, substantially as described and for the purposes specified.

Also, the combination of the float *k k*, with the rod *a* and head *c*, arranged substantially as described and for the purposes set forth.

Also, the use of alcohol for improving the quality of gas for combustion, in combination with the use of lime, substantially as described and for the purposes set forth.

65,706.—THOMAS B. STOUT, Keyport, N. J.—*Tack Hammer.*—June 11, 1867.—Explained by the claims.

Claim.—The arrangement of the hammer head oblique to the handle, substantially as and for the purpose herein specified.

Also, the claws arranged on the front side of the hammer head at the upper end thereof, and in line parallel with the handle, in combination with the oblique arrangement of the head and handle, for the purpose set forth.

Also, the combination of the oblique head and handle, and magnetized claws, substantially as herein specified.

65,707.—JOHN G. TALBOT, Sloansville, N. Y.—*Farm Gate.*—June 11, 1867.—The gate runs horizontally on a pulley, whose bearing bracket is hooked into a socket on the post. After traversing half its length it is rotated 90°.

Claim.—The single post F, provided with the eye or socket E D and hook J, and suspended roller or pulley I, in combination with the gate A B, the several parts being arranged and operating as and for the purpose set forth.

65,708.—JOHN K. UNDERHILL, Brooklyn, N. Y.—*Button Fastening.*—June 11, 1867.—The two arms are hinged together, and one of them to the rear of the button. They are brought nearly in line with each to enter the button-hole, and are then spread apart, the slotted one engaging a catch on the button, which is vibrated into contact with it.

Claim.—The button A, plate B and slotted plate C, when the same are connected and combined with each other, and made and operating substantially as and for the purposes herein shown and described.

65,709.—F. VOLKMAN, Hoboken, N. J.—*Plow.*—June 11, 1867.—The fore end of the plow beam is supported on a vertical screw, which is planted in a clamp, adjustable horizontally on the perforated axle. The draft and horizontal adjustment is by a rod, adjustable in the segment bar and in the axle, and by the chain passing thence to the beam. Vertical adjustment is by the screw.

Claim.—First, securing the upright screw shaft D in the axle A, in the manner set forth, and clamping it by means of a set screw *a'* and clamp E, substantially as herein shown and described.

Second, the link J, when arranged laterally adjustable on the plow beam, substantially as herein shown and described, and for the purpose of changing the draft of the chain I.

Third, the adjustable draft bar G, when secured by a bolt *i* to the solid axle A, and when connected with the draft chain I, substantially as set forth.

Fourth, securing the front end of the plow beam to a vertical rod D, which projects from the axle of a cart, substantially as herein shown and described, the said rod not being secured or supported in any frame or other device that is ranged above the axle A, and in contact with the same, substantially as set forth,

and for the purpose of making the whole cart lighter and of simpler construction.

65,710.—ISAAC M. WELLS, Jeffersonville, Ohio, assignor to himself and WILLIAM WOOD, same place.—*Burglar Alarm.*—June 11, 1867.—Cords proceeding from different windows and doors converge upon a disk, and are attached to pins thereon. Tension on either cord upsets the disk shaft, trips the escapement and sounds the alarm.

Claim.—First, the post or shaft B, wheel or disk H, with cords J, operating to free the verge wheel M, as and for the purpose stated.

Third, in combination with the shaft B, disk H, cords J and pivoted lever K, the pin or pins E, allowing the cords G to be self-detaching, when they have performed their duty of starting the alarm.

65,711.—CHARLES S. WESTLAND, Providence, R. I.—*Stop Motion for Steam Engines.*—June 11, 1867.—A cylinder is connected with the air chamber of a pump, and its piston with a valve in the steam pipe, so that the steam is shut off when the pressure is removed from the air chamber, as by the bursting of the hose.

Claim.—First, the combination of the air chamber B, pipe C, regulating cylinder A, containing the piston D and spiral spring E, piston rod F, with or without the sliding stop *c* and graduations, steam pipe G, containing the valve H, lever J, double-slotted graduated arm K, holding the adjustable index *a* and pipe *m*, substantially as described for the purpose specified.

Second, the arrangement of the spring on the cylinder, communicating action to the piston by a ratchet wheel and pawl, as shown in Fig. 5, said ratchet wheel held in position by a dog, substantially as described and for the purpose specified.

65,712.—HORACE WESTON, Boston, Mass.—*Sky-light.*—June 11, 1867.—Gutters are cut in the edges of the sash below the lights to collect the moisture condensed upon the glass.

Claim.—Forming grooves or gutters *a c* in the bars B and at the sides of the sash, substantially as and for the purpose described.

Also, so forming or cutting away the upper surface of the bottom rail D, that the moisture will run down into the grooves *a c*, substantially as set forth.

65,713.—E. F. WHEELER, Sag Harbor, N. Y.—*Washing Machine.*—June 11, 1867.—The tub has ribs on the bottom, against which the clothes are rubbed, as they are dashed to and fro by the teeth on the sliding head, which is reciprocated by the segment rack of the lever.

Claim.—The slide D, having prongs or fingers E projecting downward from its lower part, and rack teeth upon its upper part, in combination with the cover C, lever G, and box or tub A, substantially as herein shown and described and for the purpose set forth.

65,714.—SAMUEL M. WILLIAMS, Pine Village, Ind.—*Evaporator.*—June 11, 1867.—The pans are arranged parallel above the direct and return flues of the furnace. One is arranged higher, so as to discharge into a lower one. The finishing pan is heated by hot water in its lower chamber; steam from the latter forms a coil in the pan above and escapes to the chimney. The dampers direct the calorific to any pan or to all. The skimmer is hinged to the rod, and is oscillated by a supplementary rod.

Claim.—First, an improved evaporator, formed by the combination of the pans C D and E with the furnace A, when said furnace is constructed and arranged substantially as herein described and for the purposes set forth.

Second, the skimmer F, formed by the combination of the perforated or wire-gauze plate *f'*, the handle *f²*, and the sliding rod *f³*, substantially as described and for the purpose set forth.

65,715.—JAMES WRIGHT, New York, N. Y., assignor to himself and FRANCIS BLESSING, same place.—*Device for Cleaning the Traps of Water Closets.*—June 11, 1867.—Links with rollers at the joints form a flexible thrusting rod to remove obstructions from the bends of pipes.

Claim.—First, the flexible rod E, when made as described, in combination with the tubular guide B and inflexible handle C D, all made and operating substantially as and for the purpose herein shown and described.

Second, the friction rollers F, in combination with the links E of the flexible rod, and with the handle C D, all made and operating substantially as herein shown and described.

65,716.—A. J. ALEXANDER, Chicago, Ill.—*Grain Separator.*—June 11, 1867.—The grain is fed in at one end of the inclined cylinder; the small grain and offal fall through and are removed by the conveyer below, while the plump grain is discharged at the end into a separate spout.

Claim.—Winding the cylinder C with wire in spiral form, leaving the intervals between the threads of wire somewhat less than the transverse diameter of the grade of grain to be passed through said cylinder, substantially as and for the purpose herein specified.

65,717.—MASON C. AMES, Hartford, Conn.—*Butt Hinge.*—June 11, 1867.—The whole diameter of the joint is outside or flush with one side of one leaf of the hinge, the other leaf fitting against the former, on what is ordinarily the outside.

Claim.—The arrangement of the hinge joint b in its relative position with the plates a' a, substantially as and for the purpose described.

65,718.—CHARLES BEMIS, Mishawaka, Ind.—*Pump.*—June 11, 1867.—The vibrating lever actuates the two valved pistons, which reciprocate in the respective cylinders and drive the water through the valved passages toward the exit.

Claim.—The arrangement herein set forth of the cylinders B B', with their piston heads and rods, the pipes D and H, with their valves, and the slotted lever E, with its crank, all constructed and used with the boxes A A', as and for the purpose herein specified.

65,719.—JOSEPH C. BIRD, Rising Sun, Md.—*Cultivator.*—June 11, 1867.—The front and rear of the trapezoidal share frame may be lifted simultaneously or separately. The share is a bent plate whose flaring ends are reversible, and whose waist embraces the standard at the point traversed by the bolt of the stirrup brace.

Claim.—First, the arrangement of the share frame E, supported from the lever H H' and pivoted frame l p, in such a manner as to lift vertically or independently, as described.

Second, the trapezoid-shaped cultivator frame, consisting of the portions a a b b c c, arranged substantially as described.

Third, the share e, formed double without a weld, pinched in at the center to embrace the standard F, and with flaring ends, in combination with the stirrup brace, substantially as represented in fig. 4.

65,720.—LOUIS BRAUER, Memphis, Tenn.—*Hydraulic Weighing Apparatus.*—June 11, 1867.—The rotary scale has a continuously acting counterbalancing weight on one side of its axis, and buckets of known capacity on its circumference, to receive the liquid which flows in a regular stream. The revolutions are recorded. The liquid escapes to a drop chamber, with sample chamber and hydrometer chamber attached.

Claim.—First, a wheel which is provided with buckets or chambers upon its circumference, and also with a continuously acting counterbalance, and which is adapted for weighing, substantially as described.

Second, the combination of a registering or recording mechanism, with a continuously rotating weighing apparatus, operating substantially as described.

Third, sustaining a rotary weighing wheel, which is provided with a continuously acting counterbalance upon anti-friction rollers at both ends of its axle, and connecting such wheel directly to the registering mechanism, substantially as described.

Fourth, the case I, adapted for receiving the registering mechanism when it extends from the face plate of the wheel case A into the space surrounding the center of the weighing wheel, all constructed and arranged substantially as described.

Fifth, the trap K and overflow l, substantially as

described and shown, for conducting the fluid to be weighed upon the weighing wheel and into the buckets thereof, substantially as described.

Sixth, the arrangement of the receiving chamber below the wheel case A, substantially as and for the purpose described.

Seventh, the sample chamber F with the outlet F' and valve t, substantially as and for the purposes described.

Eighth, hydrometer receiver or receivers, for the purpose specified.

65,721.—FRANK W. BROOKS, Washington, D. C.—*Slide for Safety Reins.*—June 11, 1867.—The draw-slide of the supplementary rein runs upon the driving rein, and the safety rein connects through the gag loop with the bit ring, so as to be used in emergencies.

Claim.—First, metallic slide, which is adapted for being attached to the safety lines A of the reins B, and which is provided with a ring or loop c, substantially as and for the purposes described.

Second, the construction of an arresting hook upon the sliding portion a, substantially as described.

65,722.—CHARLES BÜNGER, New Haven, Conn.—*Match Safe.*—June 11, 1867.—The matches slide down the inclined bottom and issue consecutively through the opening into the trough, the removal of one giving place to another.

Claim.—The match safe constructed substantially as herein described, provided with an inclined bottom B, and the trough D, into which an opening through the front permits a single match to enter the said trough, and constructed so as to remove the match from the said trough, substantially as and for the purpose specified.

65,723.—R. B. CASWELL, Palmer, Mass.—*Blank for Calks of Horseshoes.*—June 11, 1867.—The bar of steel is so formed that lengths cut therefrom furnish calks ready for welding to the shoe.

Claim.—A new article of manufacture, bars of steel formed for toe calks, substantially in the manner herein described.

65,724.—GEORGE CHAMBERLAIN, Olean, N. Y.—*Stump Extractor.*—June 11, 1867.—The socket joint on which the rotating nut rests, allows it accommodation to the line of draft. The inner screw takes up the slack of the chain, and is turned by the hand wheel.

Claim.—First, the metal cap flange or head as constructed, having a concave socket, into which is fitted a concave washer to reduce the friction and allow changing the position of the line of draft on the screw, in the manner and for the purposes herein described.

Second, the flange cap C and socket concave washer E, in combination with the rotating screw box or nut F, and lever sweep K, substantially as and for the purposes set forth.

Third, the construction of the cast-iron double-headed screw, with its wrought-iron central supporting rod to give strength and durability, as described.

Fourth, the screw rod H, hand wheel k, and double hooked swivel j, in combination with the main screw D for taking up the slack in litching, as specified.

Fifth, supporting the lever sweep G on the rim of the flange cap C, so that it will operate substantially as and for the purposes herein set forth.

65,725.—JOHN M. CLARK, Somerville, Ohio.—*Corn Plow.*—June 11, 1867.—The plows are adjustable laterally and the rear end of the beam vertically by two diagonal bars running from standard to standard, the beam being pivoted to their intersection. The draw bars are adjustable on a ratchet beneath the beam. The tongue is adjustable between vertical bars on the same.

Claim.—First, the adjustable cross-braces B B connected with the rear end of the beam D in combination with the standards A A, constructed, arranged, and operating conjointly in the manner and for the purpose specified.

Second, the combination of the ratchet and latch represented in Fig. 5, with the adjustable link j and draw bars i i, arranged in the manner and for the purpose described.

Third, the guard *o* and detent *m* in combination with the tongue *k*, bars *a'*, and wooden pin *n*, arranged and operating substantially as and for the purpose described.

Fourth, the construction of the plows of a single sheet of metal in the manner represented in Fig. 3, for the purpose described.

65,726.—PATRICK CLIFFORD, Holyoke, Mass.—*Combined Level and Plumb.*—June 11, 1867.—The spirit level is attached to one end of the transverse spindle and an index finger to the other. The device may be used as a level or clinometer.

Claim.—The spindle *D* passing through the stock *M*, having secured to it at one end the case *A*, its other end bearing the index *I* on its conical part, and tightening nut *S*, all constructed and arranged substantially as herein described and set forth.

65,727.—WILLIAM S. COLBURN, Loami, Ill.—*Cant Hook.*—June 11, 1867.—The hook has rectangular notches on its lower side, engaged by the sliding bolt to allow adjustment.

Claim.—The cant hook consisting of the forked slide *D*, bolt *C*, hook *B*, and lever *A*, constructed and operating in the manner herein described.

65,728.—GEORGE W. COOPER, Ogeechee, Ga., assignor to himself and JAMES V. JONES, same place.—*Horse Hoe.*—June 11, 1867.—Explained by the claims and illustration.

Claim.—First, a plow or horse hoe of four separate sections, viz: base *A*, center plate *B*, and shares *C C*, constructed and arranged substantially as described and for the purpose specified.

Second, the shoulders *a* formed in the opposite sides of the plate *B*, substantially as described and for the purpose specified.

Third, the metallic sole *D* secured to the base plate *A*, for regulating the depth of furrow, substantially as described.

65,729.—J. H. Dallmeyer, London, England.—*Compound Lens for Photographic Portraiture.*—June 11, 1867.—Explained by the claims and illustration.

Claim.—The construction of lenses or objectives suitable for photographic purposes, the component parts of which are of such form and so positioned that by a slight variation of distance between the lenses of one of the combinations, as by means of a screw movement, the operator can produce at will any desired amount of spherical aberrations or diffusion of focus, without at the same time materially deranging the other necessary corrections of photographic lens, substantially as herein described.

Also, the combining lenses *a a' b b'*, substantially as herein described.

65,730.—GEO. W. DAY, Charlestown, Mass.—*Articles of Paper Wearing Apparel.*—June 11, 1867.—The strip of paper and woven fabric may be passed between pressure rollers together, the paper receiving impression from said fabric.

Claim.—As an article of manufacture, paper either plain or enameled, embossed or imprinted by means of a woven fabric applied to its surface under pressure, either before or after its conversion into articles of wearing, applied substantially as set forth.

65,731.—GEORGE H. DOW, Freeport, Ill.—*Bed Bottom.*—June 11, 1867.—The longitudinal slats rest near each end and at midlength on rubber blocks upon traverse slats, which are in turn supported at their ends on similar blocks upon slats beneath.

Claim.—The arrangement of the sectional rubber springs *G H*, between the single slats *E, I*, and *J*, forming a vertical series held together by the straps *K*, constituting the bed bottom, in the manner described.

65,732.—MATTHEW EASTERBROOK, Jr., Geneva, N. Y.—*Harvester.*—June 11, 1867.—Two loose pinions are arranged upon the crank shaft to engage gears of different radii on the face of a bevel wheel on the counter shaft. Clutches are feathered to the crank shaft and operated by a hand lever, whereby either pinion may be locked to the crank shaft, and its speed be thus regulated.

Claim.—The arrangement of the two loose pinions

f g, on the crank shaft *C*, in combination with the bevel, having two sets of teeth *b* and *d*, when the said pinions are locked to the shaft by a clutch or clutches, substantially as herein shown and described, and for the purposes set forth.

65,733.—WILLIAM ELMER, New York, N. Y.—*Manufacturing Illuminating Gas.*—June 11, 1867.—Explained by the claims.

Claim.—First, the construction of a tube attached to the mouth piece of each retort, and terminating in a gas-tight rotary supply valve, through which coal or other material for generating inflammable gases is introduced out of contact with the atmosphere into the retorts, and moved forward by means of a receiver and slide situated within the mouth piece, substantially as set forth, and this whether accomplished by a rotary valve or otherwise.

Second, the construction of an outlet tube from the further or back end of each retort, the end of which tube is sealed by dipping into a reservoir of coal tar or other suitable substance, so as to exclude the air from entering the retorts, and to prevent the escape of the gases generated in the retorts, by which the coke is discharged without opening the retorts, substantially as above set forth.

Third, the method of subjecting the gas material within the retorts in a gradual manner to the heat, and as the process advances and the volatile products are given off, the gas material is moved forward until brought in contact with the highest heat, where it is converted into gases, substantially as above set forth; and this whether the coal or other material employed in gas-making is conveyed into the retorts in the precise manner described or otherwise.

Fourth, the application of a current of electricity introduced into the retorts for the purpose of decomposing the aqueous vapor formed in the process of gas-making, and also for the purpose of inducing the chemical affinities of certain elementary bodies present, by which a gaseous compound is formed, as above described.

Fifth, the combination of the gas-making retort with an electric battery, excited either by heat or by chemical solutions, substantially as above described.

65,734.—JOSEPH FANYOU, Bridgeport, Conn.—*Lubricator.*—June 11, 1867.—Near the bottom of the cup is a transverse bar, which is brought against or raised from the upper end of the hollow spindle, to stop or admit the flow of oil, as the cup is screwed up or down.

Claim.—The combination, as described, of the cup and the transverse bar with the screwed spindle and regulating nut.

65,735.—GEORGE FAVINGER, Pittsford, Mich.—*Clothes Dryer and Stand Combined.*—June 11, 1867.—The "lazy-tongs" frame is retained at a definite extension by a board with hooks beneath, which catch upon the rounds.

Claim.—The cover *D*, provided with its hooks *E E*, for holding the frame as constructed in the desired position, and forming a stand for the clothes, when combined and used for the purposes specified.

65,736.—JOHN S. FIFIELD, Westerly, R. I.—*Coal Sifter.*—June 11, 1867.—The cinders revolve in the sifter until the ashes are separated, and then the revolution of the wheel in the opposite direction discharges the cinders.

Claim.—The arrangement of the box *A* with wheel *E*, as constructed, sieve *H*, spout *D*, and drawer *C*, in the manner and for the purposes substantially as set forth.

65,737.—W. W. FINCH, Mishawaka, Ind.—*Mop Wringer.*—June 11, 1867.—The mop cloth is secured to the end of the frame and to the cross-head of the sliding rod. By slipping the latter from the contracted portion of the frame it may be rotated to wring the mop cloth.

Claim.—The forked bar *E* upon the end of the rod *D*, used in combination with the frame *A*, contracted at the end in the manner and for the purposes specified.

65,738.—ADDISON L. FOLGER, Sumner, Ind.—*Sorghum Evaporator.*—June 11, 1867.—The fire cham-

ber has a longitudinal division extending from the back of the furnace to the chimney. Transverse overhanging pans are above the furnace, and longitudinal pans over the divided portion of the fire chamber; the calorific current is directed through either chamber by dampers. The pans connect by gated openings, with strainers arranged in intermediate plates which span the spaces between them.

Claim.—First, the combination of the furnace A, having a longitudinal partition A³, the transverse overhanging pans E E¹ E², and longitudinal pans M and N, substantially as described.

Second, the furnace A, constructed with double flues A¹ and A², which are independently regulated by means of the dampers C and D, arranged to operate in relation to the pans M and N, substantially as described.

Third, the arrangement of the pans E E¹ E², gates F, screen G, lever I, rod K, nut K', and springs L, substantially as described.

Fourth, the arrangement of the transverse and longitudinal pan with flanges H H, intermediate plate H', and gates F and screens G, substantially as set forth.

65,739.—CHARLES H. FOWLER, West Roxbury, Mass.—*Parlor Ten-Pin Alley.*—June 11, 1867.—Cords are attached at the base of each pin and, passing through the floor, are conducted to the player, as a means of restoring the pins to upright position. The front end of the floor behind the balls is inclined forwards by pulling on the same cord, as a means of throwing the balls on to an inclined track which returns them to the player.

Claim.—The application and arrangement of the trap floor *f* in such a manner that it shall be lowered simultaneously with the act of raising the pins, and returned to place when such act has been accomplished, essentially in the manner and for the purpose set forth.

Also, the mechanism for operating the pins and trap floor, consisting of the cords *n n n*, &c., block and wedge *v* and *c*, ropes *w g a'* and *b'*, pulley *i*, and spring *d'*, combining and operating together to produce the effects substantially as before described.

65,740.—NICOLAI C. FRANZEN, Hamburg, Germany.—*Steering Indicator.*—June 11, 1867.—Explained by the claims and illustration.

Claim.—First, the combination with a rudder of steering gear of vessels of a dial plate and index, or their equivalents, so connected with the steering apparatus that any movement of the rudder will be indicated on such dial when such dial and index or indicator are so placed in respect to the deck of the vessel as to be plainly visible from different parts of the vessel, for the purposes set forth.

Second, the combination and arrangement in such an indicator, when so located with the steering gear of a vessel, of an index moving over a dial, such index and dial being of strong contrasting colors to indicate by day the position and movement of the rudder, substantially as and for the purposes set forth.

Third, the combination and arrangement in such an indicator, so located and connected with the steering gear, of plates of differently colored glass, or other transparent material, with a movable opaque plate or surface having a suitable aperture cut therein, and with a light or lamp, arranged and combined substantially as described, to indicate at night, by differently colored lights, the position and movements of the rudder, for the purpose set forth.

Fourth, the combination in one and the same indicator of an index moving over a differently colored surface, or their equivalents, and of colored transparent plates, in connection with a movable opaque perforated plate and with any light, the several parts arranged and operating severally and in combination substantially as described, thereby rendering the same instrument either a day or night indicator of the movements of the rudder, for the purposes set forth.

65,741.—JOHN A. FREY, New York, N. Y.—*Metal Barrel.*—June 11, 1867.—The wooden hoops are driven over the corrugations and cemented to the barrel. The end hoops are secured by swaging out the chime.

Claim.—First, strengthening and protecting metallic barrels by making their hoops of wood, substantially in the manner and for the purpose described.

Second, the mode herein set forth of placing the end hoops to secure the chimes from indentations, and also the mode of securing the end hoops in place by swaging out the chimes, substantially in the manner and for the purpose set forth.

65,742.—EDWARD J. FROST, New York, N. Y.—*Magazine Revolving Fire-arm.*—June 11, 1867.—The magazine tube below the barrel communicates with the chamber of the revolving breach, into which a cartridge is forced by the magazine spring, aided by a pawl operated by the tumbler. As the hammer strikes, the shell of the previous cartridge is expelled by a sliding piston operated by the tumbler.

Claim.—First, the pawl K, in combination with the magazine spring *e*, as and for the purpose set forth.

Second, the plunger *h*, spiral spring *h'*, and thumb catch *h²*, arranged for engaging with the hammer, substantially as explained.

65,743.—FERDINAND HAASE and WILLIAM ROST, Oak Park, Ill.—*Unloading Railroad Cars.*—June 11, 1867.—The rotation of the brake drum acts by chains upon levers to which the oscillating segmental racks are pivoted, to engage said racks with spur wheels on the axles. The rack frames have anti-friction rollers, which impinge against the hinged plates and by them raise the tilting car platforms and discharge the load.

Claim.—First, the folding platform A, constructed and operating substantially as set forth.

Second, the pulley E F F, rod *g'*, and chains G G, in combination with plates H H, lever I I, cog-wheels K K, and the drum O of the brake, the whole arranged so as to bring down the cog-wheels K K, when desirable, and mesh their teeth into the teeth of the pinions R R of the car-axle, substantially as herein described and specified.

Third, the pinions R R set on the car-axes, in combination with the described device, to automatically unload the folding platform A, substantially as set forth.

Fourth, the device to gradually fold the platform A, consisting of brackets *l l* and *m n*, rods *v v*, ratchet wheel *p*, and lever *q*, constructed as described, the whole arranged and operating substantially as herein described and for the purpose specified.

Fifth, the plates T T hinged to the car frame to raise the platform B B, in combination with the said platform, substantially as described and specified.

65,744.—WILLIAM HAY, Dumbarton, Scotland, assignor to ROBERT HAY, Mineral Point, Wis.—*Scale Rule.*—June 11, 1867.—Explained by the claims.

Claim.—First, providing a rule with a fixed scale *b b* indicating the circumference of circles arranged in relation with the ordinary measuring scale *a a*, substantially as herein set forth for the purposes specified.

Second, providing a rule with a chord scale *a c*, arranged in combination with the radius scales *d d*, substantially as herein set forth for the purpose specified.

Third, providing a rule with the scale *e c*, arranged in relation with the radius scales *d d*, substantially as herein set forth for the purpose specified.

Fourth, the construction of a rule with the scales *b b c c d d* and *e e* arranged in relation with each other and with the scale of inches or other measurement, substantially as herein set forth for the purpose specified.

65,745.—JOHN E. HEATH, Niles, Mich.—*Device for Shearing Metals.*—June 11, 1867.—The jaws are shackled together and are moved by the engagement of their segment racks by the pinions on the shafts of the handles.

Claim.—The racks E G P and pinions F H, provided with the handles N N, constructed and combined substantially as set forth.

Also, the set screw O, in combination with the arms A B, provided with the racks E G P and pinions, for the purpose of limiting the movement of the arms away from each other and the movement of the operative lever.

Also, the slotted cutters J J, in combination with the screw L L, set screw M M, and jaws A B, substantially as and for the purpose set forth.

65,746.—**SOLOMON T. HOLLY**, Rockford, Ill.—*Grain Binder*.—June 11, 1867.—The band securing instrument and devices for applying the binding material to the gavel, and for compressing the same, are operated by a single driving shaft. The gavel band is tied, while the securing, applying, and compressing devices are at rest. The devices are explained in the claim.

Claim.—First, the arrangement in binding apparatus of the band-securing instrument and compressing strap-holder at opposite sides of the ring-carrier, substantially as set forth.

Second, the combination in binding apparatus of the jaws of the cord-holder with a shear blade, substantially as set forth.

Third, a cord-twister for binding apparatus, composed of an arbor and jaws, one of which is movable toward and from the other in the direction of the length of the arbor, substantially as set forth.

Fourth, the combination in binding apparatus of the following instrumentalities, viz: the ring-carrier, driving shaft thereof, band-securing instrument, and connecting and disconnecting mechanism, all operating in the combination, substantially as set forth.

Fifth, the combination in binding apparatus of the following instrumentalities, viz: the band-securing instrument, ring carrier, gearing ring, and connecting and disconnecting mechanism, all operating in combination substantially as set forth.

Sixth, the combination in binding apparatus of the following instrumentalities, viz: the band-securing instrument and gearing ring, the latter operating the former substantially as set forth.

Seventh, the combination in binding apparatus of the following instrumentalities, viz: a detachable strap-holder, detent therefor, gearing ring and ring-carrier, all operating in the combination substantially as set forth.

Eighth, the combination in binding apparatus of the following instrumentalities, viz: a detachable strap-holder, detent therefor, ring-carrier, and driving shaft therefor, all operating in the combination substantially as set forth.

Ninth, the combination in binding apparatus of the following instrumentalities, viz: the appurtenance of the band-securing instrument, gearing ring, and ring-carrier, all operating in the combination substantially as set forth.

Tenth, the combination in binding apparatus of the following instrumentalities, viz: the appurtenance of the band-securing instrument, ring-carrier, and driving shaft thereof, all operating in the combination substantially as set forth.

Eleventh, the combination in binding apparatus of the following instrumentalities, viz: the latch of the connecting mechanism of the ring-carrier and band-securing instrument, the former operating upon the latter substantially as set forth.

Twelfth, the combination in the binding apparatus of the following instrumentalities, viz: the gearing-ring, the detent of a detachable strap-holder, the detachable strap-holder, ring-carrier, and connecting and disconnecting mechanism, all operating in the combination substantially as set forth.

Thirteenth, the combination of a stop mechanism of a ring-carrier and the cord-holder of binding apparatus in such manner that the first instrumentality operates the second, substantially as set forth.

Fourteenth, the combination of the stop mechanism of a ring-carrier and the shear-blade of a binding apparatus, substantially as set forth.

Fifteenth, the combination of the stop-latches of the ring-carrier of a binding apparatus with a stop formed of parts, one of which is movable, the whole operating substantially as set forth.

Sixteenth, the combination of the movable jaw of the band-securing instrument of a binding apparatus with a hand lever, so that it may be readily opened, substantially as set forth.

Seventeenth, the guide for the binding material, consisting substantially of a V-formed instrument and gate, substantially as set forth.

Eighteenth, the combination in binding apparatus of the tongue that retains the binding material in the track of the movable instrument that is to seize it, with the driving shaft of the apparatus, through the intervention of a cam, substantially as set forth.

Nineteenth, the combination of the tongue that retains the binding material with the cord-carrier in

such manner that the former may be moved laterally to the track of the binding material to remove it from its path at one period and to insert it in its path at another in the operation of binding, substantially as set forth.

65,747.—**EDWIN B. HORN**, Boston, Mass.—*Stem Winding Watch*.—June 11, 1867.—The inner spindle is turned by its head, at the same time pushing in a pin at the edge of the watch to throw the spindle in connection with the hand-setting wheels. The watch is wound by the rotation of the middle head attached to a sleeve of the spindle, and engages a ring gear let into the face plate and engaging a pinion on the barrel arbor.

Claim.—First, the ring gear D, when arranged in combination with the face of a watch, substantially as described and for the purpose set forth.

Second, the auxiliary stem L' L passing through the center of the stem A, substantially as described and for the purpose set forth.

Third, the combination as well as the arrangement of the auxiliary stem L with the gear wheel K K and the lever M M, substantially as described and for the purpose set forth.

65,748.—**HENRY B. HORTON** and **M. L. WOOD**, Ithaca, N. Y., assignors to the ITHACA CALENDAR CLOCK COMPANY, same place.—*Calendar Clock*.—June 11, 1867.—Improvement on the patent of Henry B. Horton, April 18, 1865, and two patents of August 28, 1866.—Devices enumerated in the claims.

Claim.—First, the interposition of the connecting devices made as described, between any convenient part of the time movement and of the calendar, and all equivalent therefor, when so constructed that the calendar can be tested or proven, with or without motion of the time movement or any portion thereof, the said devices being applied to any part or point of the time movement or connected therewith, for the purpose of testing by machinery the calendar, when substantially made as and accomplishing what has been described.

Second, a changeable or self-adjusting fixture on or connected with the shaft of the twenty-four hour wheel, as specifically shown by the use of the wedge G, pin H through the tube E, and shaft F, and also at I, as set forth.

Third, broadly the employment of the mechanism described, or any equivalent thereunto, by which one or more of the calendars are tested or proven, after the clock and calendar or clocks and calendars are completed; and further, the machinery by which one or more calendars are tested or proven, whether the calendar or calendars are connected with the time movement or not.

Fourth, the employment of the crank or cranks O, or other conveniently made equivalent, with the rod or rods D, or other equivalent, by which the time calendar cams A of separate clocks are moved, for the purpose of testing or proving them by machinery, as described.

Fifth, broadly arranging and making a suitable machine or mechanism for the purpose of applying to and removing from the same in any convenient manner one or more calendar clocks, either in a finished or in any partially completed state, for the purpose of trial test or proving of the calendar or any of its parts or of any part or portion of the time movement necessary to the connection of the time movement and calendar, when substantially accomplishing the end or object desired or described.

Sixth, so arranging a series of calendar clocks, and also of calendars only, in connection with air test line or mechanism, that the changes of months, days of the month, and days of the week, or other appropriate changes of calendar clocks, are made simultaneously or nearly so, through the whole line or series, for the purpose of mutually proving or testing each other, thus making apparent any defect of construction or operation in any one or more of them, as described.

Seventh, testing calendar clocks, by applying to or actuating their movements by a propelling or driving mechanism, in such a way that these movements may be accelerated to the extent and purpose set forth in this specification, using therefor such propelling machinery as is herein set forth, or any equivalent therefor, and the interposition of the connecting devices set forth, or any equivalent therefor.

65,749.—G. C. HUNTRESS, Elkhorn, Wis.—*Buckle*.—June 11, 1867.—The frame is pivoted to the under strap, and the lever to the frame, and both carry tongues which traverse the outer strap and enter the inner one.

Claim.—A buckle consisting of the frame D, having the cross-bar F and tongue A formed thereon, and having the lever C with the tongue B attached, pivoted to the frame as herein described.

65,750.—WILLIAM MARCUS JACKSON, Woodland, Cal.—*Teeth for Lifting Lodged Grain*.—June 11, 1867.—The device is applied to a reaper to elevate lodged grain and bring it within reach of the reel. The elastic shoes and yielding fingers are attached to bars to form sections.

Claim.—The elastic shoes in combination with the yielding fingers applied to a section or frame to be attached to a reaper, and all arranged to operate in the manner substantially as and for the purpose set forth.

65,751.—W. E. JACOBS, Columbus, Ohio.—*Sirup Strainer*.—June 11, 1867.—The sirup pours into one compartment, passes under the partial division board and upward through the strainer to the overflow exit pipe.

Claim.—A straining apparatus, which consists of a box A, having a division B and strainer C applied within it, in such manner that the liquid to be strained shall pass upward through the strainer, substantially as described.

65,752.—GILBERT D. JONES, New York, N. Y.—*Press*.—June 11, 1867.—The right and left hand screws of the shaft operate cogged sectors whose oscillation actuates the toggles by which the followers are mutually approached to press the hay, &c., into the compass of a bale.

Claim.—First, in combination with the follower of a press, three toggles, arranged relatively to each other and pivoted to the follower in the relation to each other substantially as set forth, the combination being substantially as described and operating substantially as set forth.

Second, in combination with three toggles, cogged sectors attached and gearing together, substantially as described, whereby the three toggles may be made to move in unison as set forth.

Third, in combination with three toggles and their cogged sectors, a sector in gear with a screw, the combination substantially as described and operating substantially as set forth.

Fourth, in combination with two sets of toggles to operate followers in opposite directions, right and left hand screws mounted upon the same shaft, the combination being and acting substantially as set forth.

65,753.—WASHINGTON KEEMLE, Philadelphia, Pa.—*Engine Piston*.—June 11, 1867.—The piston packing is adjusted by nuts on radial screws worked by pinions which gear into a crown wheel on the end of a tube which surrounds the piston rod.

Claim.—First, the combination and arrangement of the central tube C, with the packing, by means of the crown wheel G, pinions F' F', and nuts E E' E', substantially in the manner described and for the purpose specified.

Second, the combination of the pinion P, with the follower-ring H, and with the wheel L, by means of the pinion M, and pawl O, substantially as described and for the purpose set forth.

Third, constructing the screw thread of the rod D of coarser pitch than those of the rod D D, substantially as described and for the purpose specified.

65,754.—GEORGE AUGUSTUS KEENE, Newburyport, Mass.—*India-rubber Tread for Carriage Steps*.—June 11, 1867.—The rubber tread has reticulated ridges and is vulcanized to a plate which is then secured by rivets to the step.

Claim.—The arrangement and combination of the plate F, in connection with and securely fastened to the rubber tread, consisting of reticulated ridges b and c, and intaglio cells a and d, to form a tread for a carriage step, substantially as described.

65,755.—GEOGE W. KNAPP, Corning, N. Y.—*Corn Planter*.—June 11, 1867.—The ground is spaced for

planting by a reel at each side of the machine, the reel marker operates the feed and dropping mechanism; the feed device is a series of revolving cups which raise the seed from the reservoir and drops it into the seed tubes behind the double ended and reversible furrower. Covering hoes operate in the rear of the dropper.

Claim.—First, the adjustable revolving arms D D, constructed and operating as described and for the purposes set forth.

Second, the revolving wheel K, and feed buckets c c c, constructed and operating as described, and for the purposes set forth.

Third, the automatic valves P P, as described, and for the purposes set forth.

Fourth, the automatic scrapers q q, constructed and operating as described and for the purposes set forth.

Fifth, the treadle levers 2 and 3, with levers 2 2, for elevating the arms D D D, &c., the furrowers L L, the valves P P, and scrapers q q, constructed and operating as described and for the purposes set forth.

Sixth, the combination of the arms D D, &c., with the feed wheel k, revolving feed buckets c c c, &c., and the valves P P, the whole constructed and operating as described and for the purposes set forth.

Seventh, the furrows L L, and the manner herein described of attaching and detaching the furrowers, holding them firmly, or allowing them to revolve by means of the devices herein described and set forth.

65,756.—HERMAN E. KNAPP, Benson, Vt.—*Sled Brake*.—June 11, 1867.—The hand lever is connected by a rod to the horizontal lever on the rear bob-sled, and this to levers and rods which depress the claws into contact with the ground to act as brakes.

Claim.—The levers d d, in combination with the rods f f e e, lever A, rod G, and lever C, all acting in combination with the double claw arms B, or their equivalents, the whole combined as specified and for the purpose set forth.

65,757.—F. W. L. KNUSCHKE, Providence, R. I., assignor to THE GORHAM MANUFACTURING COMPANY, same place.—*Lifter for the Lids of Pitchers*.—June 11, 1867.—The trigger, pivoted in the upper part of the handle, is pressed against the shank of the lid and raises it.

Claim.—The lifter or lever, in combination with the handle and hinged lid of a pitcher or other vessel, substantially as described for the purpose specified.

65,758.—SILAS H. LORING, Lawrence, Mass.—*Hose Coupling*.—June 11, 1867.—The socket is screwed into an opening in the side of the tank and has a threaded flange into which the outer ring of the hose is screwed; the inner ring, previously inserted, sustains the hose on the inside.

Claim.—The ring C, within the end of the hose D, in combination with the annular clamping ring E, and flange socket B, the flange A, or projecting end b, all arranged substantially as and for the purpose set forth.

65,759.—DAVID MATHEW, Prairie du Chien, Wis.—*Ferrule for Tubular Boilers*.—June 11, 1867.—The projecting ferrule ends and flanged ring protect the flue sheet from direct heat.

Claim.—First, the projecting ferrules B, constructed and arranged as and for the purpose herein set forth.

Second, the ring D, combined with the projecting ferrules in front of the flue sheet to protect it, as set forth.

65,760.—THOMAS CATO MCKEEN, Irvington, N. J., assignor to THE NEW YORK SUBMARINE COMPANY.—*Diving Apparatus*.—June 11, 1867.—The diver carries a reservoir of compressed air, with which he supplies his helmet, and with which he can inflate the buoys attached to his dress when he desires to ascend to the surface of the water. Metallic rings in the water-proof dress keep it extended and relieve the body of pressure.

Claim.—The use and application of hoops or rings to the diving dress, constructed and operating in the manner and for the purposes described.

65,761.—F. B. MORSE, New Haven, Conn.—*Joint for Carriage Braces.*—June 11, 1867; antedated May 21, 1867.—Explained by the claim and illustration.

Claim.—The cone D, formed upon an inverted conical ear C, on the one part, combined with a corresponding ear E, provided with an internal conical seat upon the other part to correspond to the cone D, the whole constructed substantially as herein set forth.

65,762.—F. B. MORSE, New Haven, Conn.—*Manufacturing Shackles for Carriage Thills.*—June 11, 1867.—The shackle is finished at a single heat from a solid piece without welding or bending, by subjecting to a series of dies which act upon special parts, and by successive impacts give the form required.

Claim.—The method herein described of forming the square-backed shackle blank, described and represented by fig. 8.

65,763.—GERSHOM MOTT, Big Run, Ohio.—*Water Elevator.*—June 11, 1867.—The links of the chain have buckets which lift and discharge the water as the wheel rotates.

Claim.—The arrangement of the chain D, provided on its inside with buckets E, with the wheel B, having arms C C, and trough F, substantially as and for the purpose herein set forth.

65,764.—CHARLES NELSON, New York, N. Y., assignor to himself and LOUIS KLUEBER, same place.—*Toy Torpedo and Explosive Compound.*—June 11, 1867.—A hollow ball of clay is filled with a composition of amorphous phosphorus, chlorate of potash, sulphur, and chalk, which are plugged in. The exterior is varnished.

Claim.—First, the toy torpedo, herein described, having a body molded in the form required, and composed of materials in the proportions which shall be harmless in exploding, substantially as herein specified.

Second, as an explosive composition for torpedoes and analogous uses, the compound herein described, composed of materials in the proportions, substantially as herein specified.

65,765.—HARRISON OGBORN, Richmond, Ind.—*Winnowing Screen.*—June 11, 1867.—The air from the pan is thrown between the upper and lower series of screws. The hopper exit is adjustable by a slide.

Claim.—First, the apparatus for giving an upward direction to the fan blast, consisting of the pivoted guide plates F', provided with rods G, in combination with the notched plates F, substantially as described and for the purposes specified.

Second, the guide plates F' and notched plates F, in combination with the screens L and H, substantially as and for the purposes set forth.

Third, the L-shaped lever R, rods I and S, pinion C on the fan shaft and gear wheel B, in combination with the screens L and H, arranged substantially as described.

Fourth, in combination with the above the adjustable slide o and pivoted lever T, substantially as and for the purposes set forth.

65,766.—HOMER RIGGS, Washington, D. C.—*Attaching Metal Soles to Boots and Shoes.*—June 11, 1867.—Explained by the claim and illustration.

Claim.—Securing taps or oversoles of sheet metal, or other suitable material, to the bottom of boots and shoes by making slotted holes *d* in the cars *a a*, and also in the rear end of the tap A, to be sprung over the screw heads *e e*, so that the taps may be removed and replaced by the wearer at pleasure, substantially as and for the purposes herein set forth.

65,767.—ALBERT W. ROBERTS, Hartford, Conn., assignor to P. JEWELL & SONS, same place.—*Apparatus for Drying Hides, Leather, &c.*—June 11, 1867.—The tubes through which air is blown to the drying room are placed in a furnace used for another purpose.

Claim.—Driving the air through heating tubes A, arranged in a heating chamber B, into a drying apartment G, substantially as and for the purpose described.

65,768.—ISRAEL M. ROSE, New York, N. Y., assignor to the SEWING MACHINE IMPROVEMENT COMPANY, same place.—*Embroidering Attachment for Sewing Machines.*—June 11, 1867.—The vibrating arm lays the cord in curves upon the cloth, the needle in its ascent coming against its curved upper end, causing its lower end to advance toward and past the needle and between it and its thread below the eye. When the needle arm descends it strikes the lower end of the vibrating arm and restores it to position, the needle passing through the loop of the cord.

Claim.—First, the combination of the frame B, spring C, and point *d* with the vibrating arm or lever D, constructed and arranged substantially as above set forth, for laying the embroidery thread or twist in proper position, as described.

Second, a spring C, having a spring point *d*, as shown, in combination with the vibrating arm D, substantially as and for the purpose set forth.

65,769.—HENRY ROTHFELDER, New York, N. Y.—*Winding and Setting Watches.*—June 11, 1867.—The burr spindle gives motion to a wheel having a wrist pin connected to a plate carrying a spring pawl acting on a ratchet wheel on the barrel arbor. The watch is wound by right or left rotation of the burr. This wheel is thrown in connection with the hand-setting pinion by a vibrating lever carrying a spur wheel at its end.

Claim.—The pawl carrier *r*, located between the usual ratchet wheel on the arbor of the spring barrel and the ratchet wheel *t*, and receiving motion from the wheel *m*, pinion *l*, and burr *d*, for winding the watch as set forth.

Also, the setting wheel *u*, provided with long teeth and set upon the levers *v*, in the manner specified, in combination with the wheel *m*, pinion *z*, and connection to the burr *d*, as and for the purpose set forth.

65,770.—CHARLES E. RUSSELL, Jacksonville, Ill.—*Stove-pipe Drum.*—June 11, 1867.—Within the part of the stove-pipe enclosed by the radiating annular drum is an axial inverted conical pipe, connected at its upper and lower ends by horizontal pipes, through which the air of the room circulates.

Claim.—The arrangement of the annular radiator A and pipe B, provided with its tubes D E and conical pipe C, in the manner substantially as and for the purposes set forth.

65,771.—JAMES P. SELSOR, Cherry Bloss, Mo.—*Corn Planter.*—June 11, 1867.—Attached to one of the ground wheels is a ratchet wheel whose projections strike a lever which actuates the dropping mechanism. The ratchet is adjusted so as to start right at the commencement of a row to plant in check rows.

Claim.—The employment of the ratchet D, substantially in the manner herein described and set forth.

Also, the combination and arrangement of the wheel A' and the ratchet D, the lever C C' and the spring C'.

65,772.—WM. A. SHEPARD, New York, N. Y.—*Brick Kiln.*—June 11, 1867.—Explained by the claims and illustration.

Claim.—First, an oblong building with a railroad track running through its whole length and divided into separate compartments by means of removable partitions, in combination with a series of cars having fire brick, or their equivalent platforms, and adapted to building kilns thereon, and burning the same on the cars, substantially as described.

Second, building and burning kilns of brick, pottery or other similar substances on movable railroad cars with platforms of fire brick, or equivalent material, substantially as described.

65,773.—WM. SIMS, Pittsburg, Pa.—*Door and Bit for Boiling and Puddling Furnaces.*—June 11, 1867.—The bit of the door, which contains the opening and is more exposed to the heat, is made of detachable plates so as to be removed when destroyed, and a new bit substituted, and not render the whole door useless.

Claim.—An improved door and a new bit to be fastened thereon for puddling or boiling furnaces, or all other furnaces subject to intense heat.

65,774.—DEXTER SMITH, Springfield, Mass.—*Priming Metallic Cartridges.*—June 11, 1867.—A small circular flange is stamped up from the center of the flange plate, and forms a cavity for the fulminate; on the fulminate is placed a small perforated disk which fits the chamber, whose edge is turned down thereon.

Claim.—A center fire cartridge in which the anvil is attached to the interior of the head of the cartridge shell by means of the flange *a*, formed on the inside surface of the same, substantially as described.

65,775.—CHARLES STEARNS, Lowell, Mass., assignor by mesne assignments to JACOB A. KISSELL, Chicago, Ill., and NATHAN BLICKENSDERFER, Erie county, Pa.—*Lightning Rod.*—June 11, 1867.—The strip is carried in a long roll before corrugating, which is done on the ground by rollers which give it a double bend transversely and a spiral turn longitudinally.

Claim.—A lightning rod or conductor, consisting of a solidly continuous strip of sheet metal, substantially as described.

65,776.—WM. J. TERRY, Walla Walla, Washington Territory.—*Fastening for Neck Ties.*—June 11, 1867.—The shank of the fastener has a removable head connected by a spring pin. Ornaments may be attached to the fastener. The surfaces impinging on the fabric have spurs to prevent rotation, and the shank passes through an eyelet in the tie.

Claim.—First, the stud or fastener provided with the removable head, constructed and applied substantially as and for the purpose set forth.

Second, the slotted shank in combination with the removable head, substantially as and for the purpose described.

Third, the head *c* and flanges or disks *b b'*, provided with points for the purpose of preventing the turning of the fastener, as described.

Fourth, the neck tie provided with the eyelet hole *f*, whereby it is adapted to be used in connection with the fastener, substantially as described.

65,777.—MRS. P. T. VINING, New York, N. Y.—*Preserving Flowers and other Vegetable Forms.*—June 11, 1867.—Explained by the claims.

Claim.—The employment of a solution of glass, or other liquid silica, substantially as and for the purposes set forth.

Also, in combination with the above, the pulverized glass or silica, all as herein specified.

Also, inclosing the objects as herein set forth in a vacuum, when they have been thus prepared.

Also, filling the receiver, in which objects prepared as above set forth are placed with an atmosphere of carbonic acid gas.

Also, the receiver for containing the carbonic acid gas as herein described, having an elastic or yielding portion, to allow of the expansion of said gas without undue pressure in the chamber of said receiver.

65,778.—STEPHEN W. WALKER, Anson, Maine.—*Horse Rake.*—June 11, 1867.—The teeth are hinged to the lower end of the bar, and are depressed by a spring which still allows them to yield upwardly when sufficient force is applied, as in surmounting obstructions.

Claim.—The combination of the frame *e*, rods *f*, springs *g*, and teeth *a*, arranged and operating substantially as described.

65,779.—WM. R. WALLIS, Alliance, Ohio.—*Attaching Eave Troughs to Houses.*—June 11, 1867.—The transverse strap and the strap which follows the curvature of the gutter are united by rivet and clamp. The suspending strap passes through and is hooked to the bar descending from the plate or eave.

Claim.—The strap D, when used in combination with the strap C and plate E, with its thumb screw F, as and for the purpose herein set forth.

65,780.—JAMES C. WALTER, New York, N. Y.—*Apparatus for Hardening and Tempering Wire.*—June 11, 1867.—The ends of the wires are clamped between blocks in the sliding head and are strained by tension on the flange of the frame through which they pass to the wire which passes through the series of eyes. Tension is given by a screw and spring.

Claim.—First, the combination of the screw C with the sliding head B and frame A, substantially as herein set forth for the purpose specified.

Second, the combination of the tension spring, the sliding head and the frame A, substantially as herein set forth for the purpose specified.

Third, the sliding head constructed with clamping blocks *d*, and tightening screws *f*, substantially as herein set forth for the purpose specified.

Fourth, the arrangement of the screw C, tension spring D, sliding head B, and frame A, substantially as herein set forth for the purpose specified.

65,781.—JEREMY B. WARDWELL, Georgetown, D. C.—*Weather Strip.*—June 11, 1867.—The strip is formed of a plate of India-rubber which conforms to the inequalities of the threshold, against which it is pressed by the springs which bear on its surface when the door closes.

Claim.—The weather strip provided with the spring by which the elastic strip F is made to conform to the irregularities of the threshold, as herein described for the purpose specified.

65,782.—A. WASHBURN and J. N. VAN SICKLE, Medina, Ohio.—*Machine for Dressing Feathers.*—June 11, 1867.—The feathers are steamed in a horizontally rotating cylinder. The steam from the jacket is turned into the perforated pipes, whence it issues in jets until shut off. The feathers are then dried by the heat of the jacket, the ventilation being open and the water of condensation directed to a single point of discharge.

Claim.—The arrangement of the pipes C D E M, faucets G, and perforated pipes H, substantially as described.

Also, the arrangement shown in figure 3, whereby during the rotation of the machine the water of condensation is led into a single pipe, from which it is discharged by faucet L, substantially as described.

65,783.—THOMAS W. WEBLEY, Birmingham, England.—*Breech-loading Fire-arm.*—June 11, 1867.—The breech is opened for the reception of a cartridge by turning down the barrel; when closed, it is secured by a locking bolt on the axis of a lever which fits against the trigger guard. A spring applied to the locking bolt cocks the hammer as the barrel comes to firing position.

Claim.—Applying a spring to the locking bolt of what is known as the Lefancheux or double-grip action catch of breech-loading fire-arms, so as to cause the gun to be self-locking when closed by forcing the barrels home.

65,784.—GEORGE W. WILSON, Chelsea, Mass.—*Air-heating Furnace.*—June 11, 1867.—The furnace, with the exception of its face plate, is inclosed in an air chamber. The described chambers and pipes form passages for the circulation of the caloric current and the air to be heated.

Claim.—The arrangement as well as the combination of the main radiator E, the fireplace A, the hollow abutments and the air space between the fireplace and the main radiator.

Also, the combination as well as the arrangement of the auxiliary radiator G, the main radiator, the fire plate, the air space F, and the abutments D D, for supporting the main radiator and conducting smoke into it from the fireplaces.

Also, the combination as well as the arrangement of the U radiators and the bent pipes L L, with the fireplace or chamber of combustion, and either or both the radiators arranged as specified.

Also, the application of the grate to the fireplace by means of the pendulous plates applied to the journals of such grate and to the fireplace, substantially as set forth.

Also, the combination and arrangement of the scraper P, and its rod Q, with the main arched radiator and the front plate H, as explained.

Also, the arrangement of the air registers with respect to the fireplace, the escape passages thereof, and the front plate H, the whole being substantially as hereinbefore specified.

65,785.—WILLIAM ADAMSON, Philadelphia, Pa.—*Glue.*—June 18, 1867.—The hot size is raised from a percolator through an artificial current of air; or a

current of air is forced through it; or it is issued in jets and is thus positively brought in contact with air. All for the purpose of obviating the tedious drying process.

Claim.—A glue consisting of size aerated, or treated with gas, substantially in the manner described.

65,786.—WILLIAM ADAMSON, Philadelphia, Pa.—*Manufacturing Aerated Glue.*—June 18, 1867.—This refers to the machinery used in making the glue the subject-matter of the preceding number.

Claim.—The mode or process substantially as herein described of aerating carbonating size for converting the same into glue.

65,787.—WILLIAM ADAMSON, Philadelphia, Pa.—*Manufacture of Glue.*—June 18, 1867.—Bi-borate of soda, 20 lbs., dissolved in water, is added to 1,000 lbs. of dissolved glue.

Claim.—The combination substantially as described of glue or size with carbonate of soda for the purpose specified.

65,788.—C. F. ALLEN, Aurora, Ill.—*Car Truck.*—June 18, 1867.—Each end of the coach is supported on the middle transverse bar of a frame, each end of which is sustained by a four-wheel truck. The transverse swinging beams have an end movement, abutting against rubber blocks at their ends, and are suspended on rubber blocks allowing a limited vertical adaptability to the track.

Claim.—First, an eight-wheel truck which is composed of two independent four-wheel trucks connected together by means of a platform A, which is supported upon, and connected by pivots to, laterally swinging spring beams, arranged substantially as described.

Second, in an eight wheel truck, the combination of the laterally swinging and vertically elastic beams D D and K, with the side springs f f, and equalizing beams D' D', so arranged that the weight of the load upon the center of the platform A' will be uniformly disposed upon all the axles of the trucks, substantially as described.

Third, the connecting platform A, constructed of wood and metal, provided with a swinging beam K and strengthened by means of trusses or braces J J, substantially as described.

Fourth, in combination with the bars b b', braces, c c, pedestals a a, steps e' e', and saddles e' e', the transverse beams C C, metal boxes e e, pillow blocks d d, fulcrum straps g', and the equalizing beams D D, with their springs and connecting loops all arranged and operating substantially as and for the purposes described.

65,789.—ELKANAH BATEMAN, Frederick City, Md.—*Flour Bolt.*—June 18, 1867.—The bolting cylinder and the fan within it revolve in different directions. The longitudinal ribs within the cylinder elevate the flour for the more effectual action of the wind thereupon.

Claim.—The buckets n, arranged and operating in combination with the bolting cylinder and fan, substantially as herein set forth.

65,790.—JULIEN F. BELLEVILLE, Paris, France.—*Car Spring.*—June 18, 1867.—The annular disks are arranged in pairs base to base, and are strung on the rod.

Claim.—The spring composed of trunco-conical disks having the form and proportions herein specified, arranged in pairs united by means of a rod passing through the center of the said disks as shown and set forth.

65,791.—MARSHALL BURNETT, Boston, Mass.—*Faucet.*—June 18, 1867.—To prevent hydro-dynamic concussion by stopping the flow gradually and allowing a portion to pass into the chamber above the valve. The valve is depressed by a cam lever and raised by an annular spring around the stem.

Claim.—A faucet having the cylinder C, valve F, cone H, and cam lever I J, all constructed and arranged substantially as shown and described.

65,792.—ANDREW CARSON, Memphis, Tenn.—*Float or Raft.*—June 18, 1867.—Explained by the claims.

Claim.—First, constructing a float for saw-mills or the purposes herein described, by securing a sufficient quantity of light timber or other material together in a solid mass, and supporting a platform on the same, substantially as herein described for the purpose set forth.

Second, attaching side floats to the main float for steadying the structure, and making room to deposit the sawed lumber, as herein described.

65,793.—LEWIS S. CHICHESTER, Brooklyn, N. Y., assignor to himself, C. W. MILLS, and G. H. NICHOLS, same place.—*Grain Dryer.*—June 18, 1867.—The caloric current passes into a lateral chamber, thence through open ended flues which traverse the grain trunk; again turning, it passes through a second similar set of flues to the exit and is moderated by an incoming blast of cold air when required.

Claim.—First, in a grain-drying apparatus a chamber above the fire into which air is admitted in large volumes and descends and mingles with the products of combustion and passes into the grain dryer, substantially as and for the purpose specified.

Second, the arrangement of the hot and cold air flues f and n, trunks g or g', and valves l' l' and m m', for regulating the temperature of the air passing into the grain-drying chamber k, substantially as specified.

Third, a series of half pipes crossing the grain chamber and opening at or near both ends into air spaces or flues as set forth, so that the current of air shall pass through and beneath the half tubes and in contact with the grain as set forth.

65,794.—JOHN W. COBB, Melrose, Mass.—*Machine for Filling Cylindrical Molds for Rubber Goods.*—June 18, 1867.—To create a rubbing friction on the rubber or on the backing of fabric, the smooth roller is rotated faster than the one containing the mold.

Claim.—So connecting by gear or otherwise the pattern roll M, with the filling roll R, that the said filling roll R shall always revolve with greater rapidity than the pattern roll M, made substantially as described and for the purpose set forth.

65,795.—J. M. and JOHN CONNELL, Jr., Newark, Ohio.—*Slate Frame.*—June 18, 1867.—The frame of the slate is held together by rubber corner casings which enter notches in the frame and obviate noise.

Claim.—A corner casing of elastic or resilient material constructed substantially as described to hook into notches in the edges of the slate.

65,796.—W. H. DOANE and W. E. LONDON, Cincinnati, Ohio.—*Wood-planing Machine.*—June 18, 1867; antedated December 18, 1866.—The heading attachment is placed on the pressure bar to gauge the depth of head from the surface of the board and secure automatic adjustment of the heading shaft. The matching heads are removable with the tops of their spindles, so that after said removal no part of the spindles is above the planing bed. This allows an easy conversion to a surface planer.

Claim.—First, the combination of two or more removable tonguing and grooving cutter heads having attaching stems formed on or applied to them, two or more spindles with their upper ends below the surface of the planing bed, and a rotary planer, constructed and arranged so as to operate substantially as and for the purpose set forth.

Second, placing the heading shaft of a planing and matching machine within or upon the pressure bar, for the several purposes and in the manner described.

65,797.—D. H. DOTTERER, Philadelphia, Pa., assignor to himself and DILLWYN PARRISI, Jr., same place.—*Axle Box.*—June 18, 1867.—The annular bearing passes around the journal and around the roller beneath, which is submerged in the lubricant. The bearing is lubricated by submergence and the axial pin of the lower roller has grooves which conduct the lubricant throughout its length.

Claim.—First, the hollow roller B, having openings arranged substantially as described, for permitting the lubricating material to pass through the said roller to the stationary pin E.

Second, the said stationary pin E and its longitudinal groove G, in combination with the hollow roller and its openings.

Third, the stationary pin *E*, arranged within the box and confined thereto by the detachable cap or follower *k*, and substantially as described.

65,798.—C. L. EASTHAM, Rhode's Point, Ill.—*Gang Plow*.—June 18, 1867.—The clevis of the plow is linked to the transverse bar, which is hinged to the axle of the carriage. The lever is connected to the rear of the plow frame, rests on a post beneath the seat, and is vertically adjusted by a lever on the carriage.

Claim.—First, the combination of the axle *A* and hinged bar *C*, provided with the lever *l*, and having the plows attached thereto, as described, all constructed and arranged to operate substantially as set forth.

Second, the combination of the lever *L*, connected to the plow beams and having a fulcrum at or near the axle, with the elbow lever *E*, pivoted to the tongue, or equivalent part, arranged to operate as described.

65,799.—NATHAN H. EDGERTON, Pottsville, Pa.—*Car Replacer*.—June 18, 1867.—The inclined planes are laid parallel to the rails and the outer one fastened thereto by a block, whose foot sets in a socket in the incline and whose hook engages the rail to prevent lateral displacement.

Claim.—First, the reversible and detachable canting block *K*, secured to the rail *A'*, and the depressed foot *n*, substantially as described.

Second, the plated incline *D*, having a projecting foot *m*, in combination with a canting block *K*, adjusted substantially as described.

Third, the combination and arrangement of my second claim with the inclined block *C*, when both are constructed and operating substantially as described.

65,800.—GEORGE D. EDMONSON, Detroit, Mich., assignor to himself and ALBERT R. CLARK, same place.—*Spectacles*.—June 18, 1867.—Explained by the claim.

Claim.—The spectacles with lenses, each of which consists of two pieces of different relative convexity and set at a different angle in the bezel, substantially as described.

65,801.—WILLIAM H. ELLIOT, New York, N. Y.—*Rock Excavator*.—June 18, 1867.—The motor is on a car, which traverses a track above. The platform of the machine is suspended from the car and the drill actuated by bands from above.

Claim.—First, the combination of car *a*, track *h'*, and drilling machine *e*, when said machine is suspended from a car, substantially as herein shown and described.

Second, platform *c*, in combination with car *a* and drilling machine *e*, substantially as and for the purpose herein set forth.

Third, adjustable support *f* and *f'*, in combination with car *a* and drilling machine *e*, substantially as and for the purpose herein shown.

Fourth, frame *m'*, in combination with drilling machine *e* and platform *c*, for the purposes herein set forth.

Fifth, braces *o*, in combination with platform *c*, substantially as and for the purpose herein set forth.

65,802.—WILLIAM H. ELLIOT, New York, N. Y.—*Drilling Machine*.—June 18, 1867.—The crank is connected to the drill spindle by a spring, supported in a carriage which slides upon or with the spindle. A spring prevents the jar from taking effect except when the drill is jammed.

Claim.—First, the carriage *k*, with springs *n* or *n'*, in combination with cranks *h'* and drill spindle *l*, when operating substantially as herein shown and described.

Second, projections *n'*, and a corresponding collar on the drill spindle, in combination with spring *n*, when employed substantially as and for the purpose herein specified.

Third, the combination of crank *h h'*, drill spindle *l*, and spring *n*, when employed as devices for producing excess of motion in the drill spindle over that given to the connecting rods by the cranks, which shall cause the machine to feed towards the rock, substantially as shown.

Fourth, the pawl *u* and rack *u'*, when acted upon

by devices producing excess of motion in the drill spindle over that of the connecting rods, for the purpose of feeding the machine towards the rock, substantially as herein set forth.

Fifth, plate *m'* with its diagonal edge, when acting on the notches on the collar *m* to revolve the drill, when operated upon by devices producing excess of motion in the drill spindle over that of the connecting rods, substantially as shown and described.

65,803.—BENJAMIN FITTS, Newark, N. J.—*Packing Pump Joints*.—June 18, 1867.—Explained by the claims and illustration.

Claim.—First, the packing, composed of india-rubber or other similar substances, formed or constructed substantially as set forth and described—that is to say, a packing made by applying the prepared India-rubber in the plastic state to the different surfaces, as shown, and compressing it to fit all the inequalities, recesses, or grooves in the metal, and being made, in vulcanizing, to adhere firmly to one part of the metal, leaving the other to be freely removed.

Second, a pump valve, composed of a metallic case, in which is confined India-rubber, adhering to the metal by being vulcanized therein and forming an elastic face, as described.

65,804.—D. H. GOODELL, Antrim, N. H.—*Fruit Parer*.—June 18, 1867.—The segmental plate is clamped to the table, and has a rack at its perimeter connected by a train of gearing to the fork shaft. The knife is at the head of a pivoted rod held to the fruit by a spiral spring. An arm meets the knife shaft at the end of the stroke, and pushes it back to a recess of its sliding slot, which holds the knife at a distance from the fork until the frame is swept back to the starting point, when the knife shaft is pushed from the said recess, and the knife comes in contact with the fruit.

Claim.—The combination of the arm *V* with the notched slot *S* in the plate, for the purpose described.

Also, the described fruit parer, when all its parts are arranged and operated as set forth.

65,805.—JOHN HAFFER and JAMES A. HENDERSON, Bedford, Pa.—*Cigar Making Machine*.—June 18, 1867.—The hopper is filled with fine-cut tobacco, and the wrapper placed on the filling tube. The ratchet-toothed plunger and the filling tube reciprocate together and force the tobacco into the wrapper.

Claim.—First, the packing tube *C*, arranged and operating as described.

Second, the combination as described of a fixed hopper tube or feed pipe with a reciprocating tube, for the purpose set forth.

Third, the combination substantially as described of a fixed hopper tube or feed pipe, with a plunger reciprocating inside and a packing tube reciprocating outside the feed pipe for the purpose of filling a wrapper with fine-cut tobacco.

65,806.—DAVID HAIN, HENRY A. GROSS, and MARTIN HAIN, Gasconade county, Mo.—*Sorghum Stripper*.—June 18, 1867.—One shank of each of the pairs of knives is jointed to one of a pair of toggle levers connected to a treadle, by whose depression the knives are opened to admit the stalk.

Claim.—First, two pairs of semi-elliptical knives *c² c³*, one pair of which is to be placed in front of the other, substantially as described and set forth.

Second, the flexible handles *c c'* in combination with the knives *c² c³*, for the purpose of allowing the said knives to yield readily to any variation in the size of the stalk passed between them.

Third, the knife handles *C'* and toggle bars *D*, when combined as herein described and set forth for the purpose of opening or raising the knife *C³*.

Fourth, the knife handles *C'*, toggle bars *D*, the spring *D²* or its equivalent, the rod *D'*, the link *d*, and the treadle *D³*, when constructed and arranged substantially as herein described and set forth.

65,807.—THOMAS HALL, Bergen, N. J.—*Typographic Machine*.—June 18, 1867.—Paper is held on the table by catches, an inking rubber is stretched over it. The type strikes the impression through the ribbon. The table is moved by a lever, and the proper keys depressed to operate the type, which strike at the same place in the machine, the paper moving

after each impression the width of the letters, and a blank key being depressed to form a space between words.

Claim.—First, weights attached to the type levers when they are so arranged that they act with less power when the type is making its impression than at any other position.

Second, the stop mechanism 1 1 1 1, and ϕ hollow shaft 2', substantially as described.

Third, the arrangement for moving table by varying length of levers to suit each type, substantially as described.

Fourth, the method of spacing between letters and words by a variable length of lever J, by which the space for each letter is increased or diminished equally, substantially as shown.

Fifth, moving paper by the clutch *n* on straight rod *m*, substantially as described.

Sixth, lever Q and connections for moving table, substantially as described.

Seventh, parallel motion for moving table backward and forward, substantially as described.

Eighth, ring R or its equivalent for stopping type when making an impression.

Ninth, automatic stop operating when the printing has reached the end of the line, substantially as described.

Tenth, varying the length of movement of the table P or substance to be printed upon by causing the keys to move different distances before acting on the feed mechanism.

65,808.—OSCAR HAMMEL, Jersey City, N. J.—*Electric Apparatus for Lighting Gas Engines.*—June 18, 1867.—A reciprocating slide gives an oscillating motion to a pendulum switch, which connects with one pole of a battery, so as to be alternately brought in contact with two studs connecting with the ignitors at the opposite ends of the working cylinder. The intensity of the current is increased by an electro-magnetic hammer and a combination helix, and the vibration of the hammer is produced by a serrated bar attached to the reciprocating slide.

Claim.—First, the arrangement of the battery B, coil C, pendulum switch G, and electric hammer E, all constructed and operating substantially as and for the purpose set forth.

Second, the pendulum switch F in combination with the slide H, or its equivalent, constructed and operating substantially as and for the purpose described.

Third, the electric hammer E in combination with the slide H, or its equivalent, and with the pendulum switch G, constructed and operating substantially as and for the purpose set forth.

Fourth, the saddle *p* on the electric hammer E in combination with the serrated bar *q* on the slide H, or its equivalent, constructed and operating substantially as and for the purpose described.

65,809.—OSWALD HESSELBACHER and HENRY MOESTA, Detroit, Mich.—*Lemon Squeezer.*—June 18, 1867.—The lemon is placed in the cup and squeezed by the plunger, which is operated by a cam groove in the lever.

Claim.—First, the construction of the frame of a lemon squeezer of the parts A and B, and a circular bracket C, which latter is adapted for receiving and supporting a straining cup D beneath a plunger E, substantially as described.

Second, the combination of the vibrating slotted cam lever G J and plunger E, with the cup D and its supporting segment C, constructed and arranged substantially as and for the purposes described.

65,810.—CHARLES T. HOLMAN, Conneautville, Pa.—*Seed Planter.*—June 18, 1867.—The furrowing teeth are adjustable vertically on the seed spout by a rod which is hung to a cross-bar of the frame. The seed slides are actuated by a cam on the axle, which also operates the patting hoes which press the earth on the seed. The axle turns freely in the frame, and the wheels turn on the axle, except when the driving wheel is coupled to the axle by the sliding ratchet clutch.

Claim.—First, perforating the shank of the furrowing tooth and arranging the seed tube to pass through it, substantially as described.

Second, arranging the hoppers on and hinging the

furrowing, seeding and covering fixtures or devices to the blocks J J, arranged to traverse between ways and adapt the planter to rows of different widths, substantially as described.

Third, and in combination with devices hinged to the blocks J J, the swinging bar Q', worked by the cam Q, and so arranged as to work and operate the several parts in the different portions in which they may be placed to vary the width of the rows planted.

Fourth, making the swinging bar M', which connects the shank of the furrowing tooth to the link so long that the tooth and link may be traversed on it, substantially as described, in adjusting the machine to rows of different widths.

65,811.—THOMAS HOLMES, Bristol, R. I.—*Water Elevator.*—June 18, 1867.—The winch shaft carries a spur wheel and a ratchet wheel; the former engages an inside gear of the drum. The brake lever has connection with the pawl, so that the raising of the former to contact with the drum will raise the pawl from the ratchet and allow the rotation of the drum.

Claim.—The combination of the brake lever G and pawl F with the gear wheels D C, when arranged substantially as described and for the purpose set forth.

65,812.—W. WHEELER HUBBELL, Philadelphia, Pa., assignor to himself and JAMES H. ORNE, same place.—*Breech-loading Fire-arm.*—June 18, 1867.—The hinged breech is unlatched, and raised for a determinate distance before it retracts the sliding breech from the bore by pulling on the link. When partially retracted, a bar catches the flange of the cartridge shell and withdraws it; a lip on the breech then strikes the arm and ejects the cartridge. In loading, the cartridge is laid on the said arm and depressed, which gives a forward movement to the sliding breech and a downward movement to the hinged breech; the further depression of the latter drives the sliding breech cartridge and retractor, and its ultimate downward movement brings it against the curved rear face of the sliding breech, forming an abutment. The cartridge is fired by a pin struck by a hammer.

Claim.—First, the breech B, with its rear face *c*, secured firmly in the concave front of the ordinary screw base *a* of the barrel by the fixed shaft or center *b*, with this breech B operating the breech C' under the side ribs *n'* by means of the link D, and locking by their faces *f* and *e* and by the projection *d* into the bore of the barrel, all within the recess, substantially as described.

Second, the detachable cheek pieces E E, arranged for the introduction of the breech C' to and its withdrawal from the recess and the rear of the barrel, substantially as described.

Third, the single retracting bar G, moving in a groove 4, in one of the two opposite sides of the recess, both in loading and extracting the cartridge shell by the projection 5 in the slot 9, and intercepted at each end of the latter by the breech C', substantially as described and shown.

Fourth, the stationary rear striker I², and the breech B and its striker I¹, operating together as described both with and without the front striker I, when the ends of the striker and breech pieces are beveled, substantially as specified.

Fifth, the ribs *n'*, in combination with the rear space *w* and with the retractor G, to insure the insertion of the flange of the shell in the rear of the retractor head 6, as described.

Sixth, the combination of the breech B, link D, breech C', retractor G, arm F, with the strikers, constructing and operating together successively in the recess and with the barrel to insert, fire, withdraw, and eject the primed ammunition or shell, as described.

65,813.—P. M. HUFFMAN, Harvard, Ill.—*Cough Mixture.*—June 18, 1867.—Composed of syrup of squills, 2 oz.; laudanum, 1 oz.; tincture of lobelia, 1 oz.; oil of anise, 1 oz.; castor oil, 2 oz.; extract of cubeb, 1 oz.; extract of licorice root, 2 oz.; balsam of tolu, 1 oz.; and honey, 1 lb.

Claim.—A cough mixture which is composed of the several ingredients mixed together in about the proportions specified.

65,814.—MOSES A. JOHNSON, Lowell, Mass.—*Carpet Lining.*—June 18, 1867.—Explained by the claim.

Claim.—As a new article of manufacture a felted hair bat, or its equivalent, covered with strips of paper on one or both of its sides, and leaving intervening uncovered spaces between the strips for the dust to pass through.

65,815.—LUTHER C. KEELER, Montrose, Pa.—*Shoe Holder.*—June 18, 1867.—The hook is hung to the box to sustain a shoe, as a sample of the contents.

Claim.—A shoe holder, constructed as described, consisting of the standards B B', one or more, provided with hooks, a stirrup or plate A and clasp D, substantially as herein shown and described.

65,816.—EBEN W. KEYES, Boston, Mass.—*Parlor Tennis Alley.*—June 18, 1867.—The buffers which receive the balls may be folded down at either end, to enable the game to be played from the other end.

Claim.—A parlor alley made with movable or folding buffers D D', substantially as described, and for the purpose set forth.

65,817.—GEORGE H. KITCHEN, New York, N. Y.—*Construction of Signs.*—June 18, 1867.—The opening in the opaque frame is of the shape of the letter, &c., to be represented, and is filled with a series of glass prisms illuminated from the rear.

Claim.—A prismatic illuminator formed of an opaque case with openings to which prisms are applied, substantially as and for the purposes set forth.

65,818.—A. KOMP, New York, N. Y.—*Apparatus for Washing and Separating Coal.*—June 18, 1867.—The coal, ashes, and cinders from a furnace are ground, washed, and elevated into the drum, where the material is assorted by fineness and passed to the shaking machine, where they are separated according to gravity.

Claim.—First, the arrangement of the grinding rollers C and elevator D, in combination with the assorting drum E, constructed and operating substantially as and for the purpose set forth.

Second, the arrangement of the assorting drum E, in combination with the separating machines G, constructed and operating substantially as and for the purpose described.

Third, the arrangement of the drying drum A, in combination with the separating machines G and assorting drum E, constructed and operating substantially as and for the purpose set forth.

65,819.—ISRAEL L. LANDERS, Lancaster, Pa.—*Fence.*—June 18, 1867.—The ends of the panels rest on sills, and the overlapping top rails are wrapped with wire, which descends to the ends of the sills and forms lateral braces.

Claim.—So constructing the panels of a fence that one of the rails of each panel shall overlap the corresponding rail of the adjoining panel and securing the same together by a wire-brace, in the manner specified.

Also, specially the mode of fastening shown in Fig. 5.

65,820.—FREDERIC J. F. LAUMONIER, Angers, France.—*Circular Coke Oven.*—June 18, 1867.—The circular group of ovens is divided into radial compartments, which form conical ovens and converge towards a central chimney. Each oven is charged, through a hole in the center of its arch, from a wagon with a tilting bottom, which traverses a circular railway above the ovens. The flues traverse the partitions and pass beneath the ovens. The charge is drawn through the open doorway of each oven by an engine which traverses a circular track and drags the coke from the sloping floor by a chain and rake laid thereon before changing. Water from either of the circular series of plugs is thrown on the coke.

Claim.—First, a circular coke oven composed of any suitable number of radial compartments converging towards a central chimney, substantially as herein described.

Second, the combination with the radial compartments of a circular coke oven, as described, of the flues for conducting the products of combustion from

the said compartments to the central chimney, under the arrangement herein shown and specified.

Third, the combination with the radial compartments, provided with openings in their top, of the circular railway passing over the said openings, as and for the purposes set forth.

Fourth, the application and use, in connection with the herein-described coke oven, of the water conduit or pipe encircling the same, substantially as and for the purposes herein specified.

65,821.—WM. E. LONDON and JOHN RICHARDS, Cincinnati, Ohio.—*Shaft Coupling.*—June 18, 1867.—The end of each shaft has a split conical sleeve, which is jammed thereon by conical collars and set nuts. The ends of the shaft are united by a feather and by bolting together the flanges of the collars.

Claim.—The use of two conical sleeves within two separate conical shells, arranged to act independently on each shaft and forming the two halves of a shaft coupling, as herein set forth and described.

65,822.—LAFAYETTE LOUIS, Providence, R. I.—*Melodcon.*—June 18, 1867.—A simple valve is employed for direct action, which is held normally open by a lever and spring. To bring the tremolo in action the direct-action valve is closed by moving the lever, and the bellows draws air from the reed chamber by the weighted valve, which pulsates and produces the required effect.

Claim.—First, combining with a tremolo valve *h*, hinged directly to an immovable or fixed valve seat, an auxiliary valve *g*, for regulating the direct passage of the air from the reeds to the bellows, substantially as described.

Second, in combination with the valve *h*, the lever *m* and its counterbalancing weight *q*, when this lever is pivoted or hung directly in or to the valve board, substantially as set forth.

Third, applying such weight to the lever by means of an adjusting screw, substantially as set forth.

Fourth, combining with the valve *g* the buttons *r*, made adjustable with respect to the valve seat, substantially as described.

Fifth, combining with a tremolo valve *h* and a direct passage valve a lever extended down from the valve to such position that it may be operated by the knee or foot of the performer, substantially as set forth.

65,823.—HENRY W. MILLER, Utica, N. Y.—*Apparatus for Heating Cheese Vats.*—June 18, 1867.—The vat is tipped or levelled by the lever cams, which are pivoted to the legs. The pipes lead from the vat to the furnace and, after passing the latter, are conducted back again, so as to heat through the water below the pan by jets of steam, and return to the cooler.

Claim.—First, in combination with one or more cheese vats, a heater constructed of metallic pipes, substantially as herein described and set forth.

Second, connecting a coil of metallic pipes, which forms either wholly or in part the heater of a cheese vat, with one or more perforated pipes G placed in said cheese vat, substantially as herein described and for the purpose specified.

Third, in combination with a cheese vat and a circulating heater for said vat, the arrangement of the heating pipes G and the cool-water pipe E, substantially as herein described and for the purpose specified.

Fourth, the combination of the pan H with a coil heater D and one or more cheese vats, when constructed and arranged substantially as herein described and for the purposes specified.

Fifth, the use of the eccentric legs or levers, in combination with a cheese vat, constructed and operating substantially as herein described and set forth.

65,824.—MILTON V. NOBLES, Elmira, N. Y.—*Life-boat.*—June 18, 1867.—The double cover is inflated and the hold ventilated by a fan blower in the hold. The cover has windows around its sides.

Claim.—First, covering the hold of a life-boat with a flexible air and water-tight covering, supported by and fastened to a sustaining frame, substantially as described.

Second, making the cover of a life-boat of double rubber or other cloth, with air space between, so that it may be inflated and thus made more buoyant, substantially as described.

Third, ventilating the hold of a life-boat through a hollow mast furnished with separate passages, whether by natural or artificial currents, of out-going impure and incoming fresh or pure air, substantially as described.

65,825.—MILTON V. NOBLES, Elmira, N. Y.—*Boat Detaching Tackle.*—June 18, 1867.—The hook is upon a frame which is linged to the deck of the boat so as to lie upon the same when unengaged. The points of the hooks enter detent sockets, which are depressed by the oscillation of a rock bar running from stem to stem to free the hooks.

Claim.—In combination with hinged and dropping holding heads, the lifting and lowering rods *l* and the locking and unlocking arms *b*, all operated by one lever or one shaft, so that the whole may be within the control of one person, substantially as and for the purpose described.

65,826.—ISAACH P. PALMER, Lodi, Wis.—*Unloading Grain.*—June 18, 1867.—The valve bar is operated by a rack and spur wheel, and allows the discharge of grain into the funnel hopper beneath the car floor.

Claim.—First, valves in the floors of cars, carriages, &c., for drawing off grain and other materials without handling the same, substantially as described.

Third, the side valves *b*, in combination with the racks *e*, pinions *i*, and shaft *D*, substantially as described.

Third, the pivoted valve *c*, in combination with crank *i*, substantially as described.

65,827.—ALBERT W. PRESTON, Mazon, Ill.—*Glove for Husking Corn.*—June 18, 1867.—The glove is made to cover the parts of the hand subjected to greatest wear, and has claws to engage the husk.

Claim.—A husking glove to cover the back of the hand, thumb, and fingers, and the fronts of the ends or first joints of the thumb and fingers with a strap around the thumb and wrist, substantially as shown and described.

Also, a husking glove with the front of the fingers and thumb covered or shod with sheet metal, substantially as described.

Also, in combination with the plate on the thumb, the spur or projection *G*, on said plate.

Also, in combination with the plate on the forefinger, the spur or projection *K* on said plate, for opening the husks on the ears of corn.

Also, in combination with the plate on the forefinger and the spur for opening the husks, the projection or arm *J*, to rest on the back *o*, the middle finger to prevent the plate from turning on the forefinger.

Also making the backs of the fingers to lace up, substantially as described, so as to adapt the glove to fingers of different sizes.

65,828.—WILLIAM RALPH, Utica, N. Y.—*Milk Can.*—June 18, 1867.—The handle plates have sockets to receive the intumed ends of the bail upon which it is wanted to pour out the contents.

Claim.—First, the socket *a*, when applied substantially as described for the purpose mentioned.

Second, the combination of the plate *B*, socket *a*, and handle *C*, for the purpose set forth.

65,829.—TIMOTHY K. REED, East Bridgewater, Mass., assignor by mesne assignments to S. J. SHAW and THOMAS COREY.—*Stay or Brace for Boots and Shoes.*—June 18, 1867.—The metallic plate is riveted to the upper at the front end of the slit.

Claim.—The application and arrangement of a metallic brace stay or cap with respect to the junction of the sides of the slit in the upper of a balmoral boot or shoe, as herein described.

Also, as an improved manufacture, a balmoral boot or shoe as provided with a stay brace or cap arranged with respect to the junction of the sides of the slit of its upper, as hereinbefore explained.

65,830.—JACOB REESE, Pittsburg, Pa.—*Refining Iron, Steel, and other Metals.*—June 18, 1867.—The metallic oxide protects the metal from the carbon of the fuel. The hydrogen unites with the carbon, sulphur, and phosphorus of the metal.

Claim.—First, refining iron, steel, and other metals by means of a blast of atmospheric air, or other decarbonizing blast, in a refinery or furnace heated with

coke or other carbonaceous fuel, when a layer of metallic oxide is interposed between the fuel and the metal under treatment, for the purposes hereinbefore set forth.

Second, the use of a covering of metallic oxide for protecting metals from the influence of carbon, substantially as hereinbefore described.

Third, the use of hydrocarbon liquid, vapor, or gas, in the process of refining iron or steel, in the manner substantially as hereinbefore described.

Fourth, the use of a hydrocarbon liquid, vapor, or gas, for the purpose of removing sulphur and phosphorus, or either of them, from iron, steel, or other metals, in the process of refining, substantially as hereinbefore described.

65,831.—JACOB REESE, Pittsburg, Pa.—*Machine for Making Fish Bars for Railroad Rails.*—June 18, 1867.—The moving die and the punches which traverse the same are actuated by separate cams, so arranged that, at the completion of the pressing operation, the punches will descend and make their oblong holes in the fish plate.

Claim.—The combination of the moving die *o*, and stationary grooved die *o'*, with the punches *s' s'*, operating and arranged substantially as described, for the purpose of pressing, punching, and bending fish bars at one operation.

65,832.—JACOB REESE, Pittsburg, Pa.—*Machine for Straightening Cylindrical Bars of Metal.*—June 18, 1867.—The bar rests on a free roller between the conical-ended rolls, which rotate in contrary directions; the cone which gives the downward turn to the bar rotates more rapidly than the other to insure the proper depression of the bar.

Claim.—First, rolling and straightening cylindrical rods, bars, shafts, and tubes or pipes of iron, steel, or other metals, between the conical faces of revolving disks or the conical ends of revolving rolls, arranged substantially in the manner and for the purposes above set forth.

Second, the pair of revolving cone-faced disks, arranged as described, so as to revolve in opposite directions, having their axes of revolution inclined, so as to bring their operative faces, forming the bite of the disks parallel to each other, and having their axes in slightly different planes for the purpose of giving a combined rotary and forward motion to the metallic rod bar shaft or tube held between the bite of the disks, substantially as hereinbefore described.

Third, the combination of a pair of rolls or disks *d d'*, having conical ends or faces, with the rest roller *n*, arranged and operating substantially as hereinbefore described.

Fourth, the combination of the screw *p*, with the axle *b* and disk or roll *d'*, for the purpose of increasing or lessening the distance of the disk or roll *d'* from its corresponding disk or roll *b*, substantially as above described.

65,833.—CELIUS E. RICHARDS, North Attleboro', Mass.—*Paper Braid.*—June 18, 1867.—The braid forms a substitute for straw plait, &c.

Claim.—A braid or band, composed of a series of paper threads or strands united together, and to be used as and for the purposes set forth.

65,834.—JOHN C. ROGERS, Alden, N. Y.—*Sulky Plow.*—June 18, 1867.—The beam near its rear end is connected by a link, rack, and spur wheel to the frame. Jaws on the tongue sustain the forward end of the plow beam when moving from field to field.

Claim.—First, connecting a sulky to a plow by means of the link or universal joint *D*, or equivalent, for the purpose and substantially as herein described.

Second, the combination and arrangement, with a plow of common construction, of the rack *D*, link *D*¹, pinion *E*, crank shaft *E*¹ *F*, weighted pawl *G*, and ratchet wheel *G*¹, all arranged upon a sulky, in the manner and for the purpose substantially as described.

Third, the projection *d*², or equivalent, formed upon or connected to the lower end of the rack *D*, in rear of the link or universal joint *D*¹, for the purpose and substantially as described.

Fourth, the spring rods *I*, when constructed and used for the purpose substantially as herein set forth.

Fifth, the jaws *J*, in combination with the pole of

a sulky plow, for the purpose and substantially as described.

65,835.—BLANEY E. SAMPSON, Boston, Mass., assignor to himself and J. B. PROCTER, Fitchburg, Mass.—*Window Sash Supporter.*—June 18, 1867.—By depression of the roller it is withdrawn from its jammed position between the sash and casing, and the sash is thereby made free to move. The spring restores it, and holds the sash in position.

Claim.—The combination as well as the arrangement of the inclined plane *b*, the roller *c*, the carrier rod *d*, its arm *f* or arms *f f'*, the spring *e* and the spring latch *l*, arranged in the window frame, the whole being substantially as described.

65,836.—DAVID SAUNDERSON, St. Louis, Mo., assignor to JOHN RINGEN, same place.—*Bowling Oil Cans.*—June 18, 1867.—The box has upper and lower openings, the former to admit a wedge to hold down the nozzle from injury in shipping, and the latter to force the nozzle up for decanting.

Claim.—The combination of the wooden box *B*, can *F* and wedge *A*, as above named and described, and for the purposes set forth.

65,837.—WILLIAM SIEFERT, New York, N. Y.—*Sad Iron.*—June 18, 1867.—The stem on the handle fits into the socket on the iron, and is fastened by a bayonet joint. The spring throws the projection into a notch of the slot, which prevents rotation, until by depression it is disengaged.

Claim.—A sad iron, having stem *C*, with spiral spring *s* and projection *a* thereon, in combination with the slot *v v'*, with the upward projection therein, as described, when constructed, arranged, and operating as herein specified.

65,838.—E. K. SMITH, Philadelphia, Pa.—*Composition for Matches.*—June 18, 1867.—1 lb. of phosphorus is dissolved in a solution of 5 lbs. of glue. Red lead, 14 lbs., is mixed with 8½ lbs. of nitric acid, and added to the former composition, to be applied to wooden splints.

Claim.—A composition, consisting of the materials described, for the purpose specified.

65,839.—SAMUEL W. SOULÉ, Milwaukee, Wis.—*Numbering Machine.*—June 18, 1867.—For numbering checks, bonds, &c., consecutively. The numbered disks are arranged on a shaft and connected to move serially. The depression of the shaft actuates the disks and inking roller.

Claim.—First, the stamp frame with its shaft and plate *J*, cylinder *a*, ratchet *S*, type wheels *v v z*, frames *B C*, dog *d*, and dogs *e f*, all constructed and arranged substantially as and for the purposes set forth.

Second, the arrangement of the arm *E*, plate *F*, roller frame *H*, with rollers *K R* and spring *c*, in combination with the revolving table *M* and screw *P*, when used in the manner and for the purposes set forth.

Third, the guide frame *X* and rubber *Z*, for regulating the printing of the type by means of its slide *x'*, in the manner and for the purposes specified.

65,840.—JAMES H. SPERLING, Peru, Ind.—*Medical Compound.*—June 18, 1867.—For the cure of intermittent fevers. Composed of nitre, 2 drachms; gum camphor, 1½ drachm; cayenne pepper, 10 grains; mix, place in a sack and apply over the epigastrium to anticipate the chill.

Claim.—The combination of the said ingredients in the proportions designated, substantially and applied in the manner set forth.

65,841.—NATHAN STARBUCK, Wilmington, Ohio.—*Ditching Machine.*—June 18, 1867.—Improvement on his patent, August 1, 1865. A pair of guiding wheels support the front end of the frame. The cutting wheel is hung in an adjustable sliding gear. The scraper is placed in the rear of the cutting wheel and curved at the upper part to act as a mold board. A fender with sliding sides moves the dirt laterally from the side of the ditch.

Claim.—The combination of the vertically adjustable yoke *F*, cutting wheel *G*, lever *H*, scraper *I*, suspended in the rear of said wheel *G*, to the hinged

pendant *g* and fender *K*, arranged and operating as and for the purpose herein set forth.

65,842.—CHARLES H. THOMAS, Philadelphia, Pa.—*Bottling Mineral Waters.*—June 18, 1867.—The water is drawn from a considerable depth through a pipe let down in the spring; a perforated plate of glass is placed in the water below the mouth of the tube and jets of gas from a reservoir are discharged below the plate.

Claim.—First, bottling or drawing water from mineral wells or springs under pressure, substantially as described.

Second, taking the water from a point in the well or spring below the point of discharge, substantially as described.

Third, the use, in a universal well or spring, of the perforated diaphragm *a*, as herein set forth.

Fourth, the charging of mineral waters with an extra supply of gas, either in the well or in the tank, substantially as herein described.

65,843.—S. E. TOTTEN, Brooklyn, N. Y., assignor to himself and CYRUS L. TOPLIFF, same place.—*Awl.*—June 18, 1867.—The awl is driven through the leather and its groove permits the passage of the bristle of the wax end without withdrawing the awl.

Claim.—An awl having a longitudinal groove *D*, as herein set forth for the purpose specified.

65,844.—W. H. TRISSLER, Cleveland, Ohio.—*Preserving Fruit.*—June 11, 1867.—The top plate of the can has a tube to which an air pump is attached. The air being exhausted, the pipe is pinched to close it and thus the air is excluded.

Claim.—The pipe *D* and plate *B*, as arranged in combination with the can *A*, when used for the purpose and in the manner described.

65,845.—JAMES F. VALENTINE, Union County, Ohio.—*Dressing Side Straps for Harness.*—June 18, 1867.—The strap slips beneath the levers in the box and the edges are dressed by the knives.

Claim.—The combination and arrangement of the knives or bits *f f'* with the box or trough, together with the levers *b b'*, the pin or bolt *e*, and the widening or regulating screws *d d'*, substantially as set forth and for the purpose therein named.

65,846.—HENRY C. VAN TINE, Pittsburg, Pa.—*Apparatus for Burning Petroleum and other Hydrocarbons.*—June 18, 1867.—The hydro-carbon is admitted below the gravel and burnt upon the surface of the latter; jets of steam enter the furnace from a perforated pipe.

Claim.—The use of a fire pan filled or partially filled with gravel or small stones, and supplied with petroleum or other hydro-carbon fluid by a pipe or pipes, in combination with a perforated pipe or pipes for admitting jets of steam into the fire space above the surface of the gravel, substantially as and for the purposes hereinbefore described.

65,847.—THOMAS P. WARREN, Norfolk, Va., assignor to WARREN & WOODHOUSE, same place.—*Combined Cotton Plow and Scraper.*—June 18, 1867.—Side scrapers and shares are attached to the sole bar in rear of the broad share to adapt the machine to different phases of corn or cotton cultivation.

Claim.—First, the standard *B* having the broad flange *x*, the slots *b b'*, and the arm *z*, substantially as and for the purpose described.

Second, the combination of the standard *B* and the flanged supporting attachment *C*, substantially as and for the purpose specified.

Third, the scraper guide *K* attached to the landside in the manner and for the purpose above shown.

65,848.—RUFUS WATSON and THOMAS SPENCER, Central College, Ohio.—*Manufacture of Sorghum Sugar.*—June 18, 1867.—A vertical series of adjustable inclined troughs are supported in a frame and the sirup allowed to run from trough to trough to assist in granulation.

Claim.—First, the herein-described process of granulating sirup: the said process consisting in having the sirup flow over a shelf or shelves, or their equivalent, of suitable length and inclination, so as to effect granulation, substantially as described.

Second, the apparatus constructed substantially as herein described, for the purpose set forth.

65,849.—WILLIAM WELBOURNE, Preston, England.—*Tea Canister.*—June 18, 1867.—The box is divided into several vertical compartments by transverse divisions, the said compartments reaching to a slanting partition near the bottom having sliding doors, by whose retraction the tea is discharged into a lower cavity, which is shut by a vertically-sliding door.

Claim.—A canister having partitions and doors arranged and operating substantially in the manner and for the purpose described.

65,850.—CHARLES V. WILSON, Newark, N. J.—*Pot for Lead Bath for Tempering Steel, &c.*—June 18, 1867.—The wrought-iron pot has a cast metal exterior casing.

Claim.—The pot or bath made of wrought and cast iron, combined substantially in the manner and for the purpose hereinabove specified.

65,851.—MOSES B. WRIGHT, Meriden, Conn.—*Lamp Burner.*—June 18, 1867.—The upper wick tube is of larger diameter and is separated from the lower one, which communicates with the reservoir. The object is to isolate the heated tube from contact with the oil chamber.

Claim.—A lamp burner provided with two wick tubes *b e*, one of which *e* is placed above and not surrounding the other *b*, and which communicates with a closed chamber below, substantially in the manner and for the purpose set forth.

65,852.—WILLIAM WYATT, New Bedford, Mass.—*Furling and Reefing Sails.*—June 18, 1867.—Explained by the claim and illustration.

Claim.—The combination and arrangement of the furling and reefing top-gallant sails and royals by means of head lines and luff lines running through blocks on the upper and under sides and ends of the yard, and travelers affixed to the sail and running in grooved ways formed by securing metallic plates to the yard, as herein described, operated by raising and lowering the yard, as set forth, for the purpose specified.

65,853.—CHARLES L. ZEIDLER, Cincinnati, Ohio.—*Machine for Making Match Splints.*—June 18, 1867.—The block of match wood is placed between the fixed bridge and the reciprocating series of tubular cutters, by which a row of round splints is shaved from the lower side.

Claim.—The knife constructed in one piece, with punches K K and rearward prolongations J J', all as herein described and for the purposes specified.

65,854.—EPHRAIM ADAMS, Jr., Attleboro, Mass.—*Hoop Skirt.*—June 18, 1867.—The bustle hoops encircle the body instead of having a gap in front, and are attached to the tapes which extend from the waistband to the bottom of the skirt.

Claim.—The combination of the bustle springs *e* and the central tape *d*, substantially as described for the purpose specified.

65,855.—JAMES C. ADAMS, Philadelphia, Pa.—*Metallic Paint Keg.*—June 18, 1867.—The can is intended for use by manufacturers to pack paint in, and by the painter as a paint pot.

Claim.—A metallic paint keg, having its top formed by turning over the edge thereof flat, twice, substantially as shown and described.

65,856.—JOSEPH ADAMS, New Orleans, La.—*Machine for Fastening Bale Ties.*—June 18, 1867.—The hoop is slipped through the buckle, which is then inserted laterally in the mortise of the clamp, being guided by the spring rod. The hinged lever is then oscillated, bending the hoop over the bar of the buckle.

Claim.—First, the mortise C in the bed of the machine, to admit the tie buckle or fastening, and to accomplish its adjustment to the hoop by the same motion which bends the hoop.

Second, the spring G, as set forth above.

Third, the indentation or oval shape in the handle at the point I and at the points H II, to form the

bend over and under the spring G, substantially as described and represented.

65,857.—J. B. ALEXANDER, Washington, D. C.—*Stopper for Bottles, Jugs, &c.*—June 18, 1867.—The rod for attachment of the cord passes axially through the cork and an upper and lower washer, the latter of which is in a recess stopped by a plug to protect the metallic washer from the action of the liquid.

Claim.—The bore I, Figs. 1 and 2; the plug E, Fig. 1; the plug F, Fig. 2; the screw H and auxiliary piece G, Fig. 3, in combination with the rod C and the plates B and D and the body A, substantially as described and for the purpose set forth.

65,858.—GEORGE ARNOLD and JACOB GREVE, Cleveland, Ohio.—*Washing Machine.*—June 18, 1867.—The oblong box has an under, corrugated, rubber board resting on a roller at its lower end, and on springs taking over the box end at its upper end. The rubber block above it has ratchet corrugations calculated to draw the clothes between the surfaces, and is actuated by oscillating arms pivoted to the under board, having lugs entering slots in said arms.

Claim.—First, the rubbing board C, as arranged in combination with the board D, provided with angular notches *a'*, arms L, and springs O, for the purpose and in the manner set forth.

Second, the rubbing board C, rollers L L', as arranged in combination with the roller J, springs E, and box A, as and for the purpose described.

65,859.—WILLIAM RHODES ARNOLD, Providence, R. I.—*Lapping Braid.*—June 18, 1867.—The two-barred swift is mounted on a shaft which has end movement by a cam upon the side of its driving wheel. This end movement causes the winding of the tape in two courses side by side in the stick. A catch serves to stop the rotation when the proper length has been wound on.

Claim.—First, the machinery for measuring and lapping braids, tapes, &c., having a shifting and positive stop motion, substantially as herein described.

Second, the sliding shaft *a*, the spring *c*, the pin *g*, and cam *b* on the gear wheel C, combined and operating substantially as and for the purposes herein described.

65,860.—J. P. AVERY and W. L. NICHOLS, Norwich, Conn.—*Street Lantern.*—June 18, 1867.—The glass is clamped and packed between plates held together by screws, and these plates are bent around into form of pipes to convey air from their lower ends to the flame at the level of the latter.

Claim.—First, the combination with the lantern head or frame of air tubes *b*, arranged for supply of air to the flame substantially as specified.

Second, the independent frames D E, in combination with the rope or cord packing *d*, arranged to fit a groove *c* in one frame, and clamped or held together to hold the frame in between them, essentially as herein set forth.

65,861.—CHARLES H. BAGLEY, Elgin, Ill.—*Feed Roller for Lamp Wicks.*—June 18, 1867.—One flange of the angle strip is coiled around the spindle; the other flange is notched, and its spikes project to form a toothed roller.

Claim.—A tooth or pronged roller drum or cylinder, made from a strip or strips of sheet metal, or other suitable material, provided with teeth along one or both of its edges, and spirally wound into the form of a cylinder or other equivalent shape, substantially as and for the purpose described.

65,862.—ALFRED M. BAILEY, Middlefield, Conn.—*Non-Freezing Water Gate.*—June 18, 1867.—The upper end of the operating gate-rod is within a pipe containing oil, to prevent the freezing up of the same.

Claim.—First, the within-described method of protecting moving parts from freezing, the same consisting in inclosing the parts at or near the water level within the casings, which contain a fluid supported by the water and not liable to congelation, while the water outside of said casing stands at or near the same level, and is prevented by said casings from displacing the same, substantially as and for the purpose herein specified.

Second, floating either form of the inclosed tube

and connected parts of the above-described apparatus, so that it shall rise and sink with the water in which it is supported, or with the ice, which becomes attached thereto, substantially as herein specified.

65,863.—GEORGE H. BAILEY, Jersey City, N. J., assignor to AMERICAN WATER AND GAS PIPE COMPANY.—*Device for Tapping Cement Lined Pipes.*—June 18, 1867.—The flanged nipple is passed through the perforation of the metallic case, and attached therein by a nut. The flange and the inner end of the nipple are covered with the cement, which is bored out when a connection is made. The outer end of the nipple is covered by a screw cap.

Claim.—First, the combination of the tap D, bored through from end to end, with the combination iron and cement pipes, substantially in the manner and for the purpose described.

Second, the constructing the flange *a* upon the tube or nipple at an intermediate point between the ends thereof, as shown in figure 4 of the drawings, so that when the device is applied to a cement lined pipe the cement lining shall not be liable to break off in tapping, substantially as described.

65,864.—FREDERICK BALDWIN, Brattleboro', Vt.—*Wood Turning Lathe.*—June 18, 1867.—Improvement on his patent August 24, 1858. The tool-holding dogs are in form of a bell crank, one arm of which carries the tool and the other is acted upon by the toe plate, connected to a collar moved laterally by a sliding rod whose end traverses the face of a revolving metallic pattern. The pattern receives motion from a screw gear on the main shaft, and its direction of rotation is governed by a sliding spline key, which engages with one of two bevel wheels or a collar between them.

Claim.—First, the method as herein substantially described, of operating the cutters, on the rotating disk *A'*, by means of the dogs *h k*, the spring *i*, the toe *J*, the collar *c'*, the pin or rod *p*, and the arm *L*, which are moved and operated by the revolving pattern through the rod *m*.

Second, the clutch *V'*, which is placed between two bevel gears, for the purposes described, and which is operated by a shifting lever and a sliding bar substantially as set forth.

65,865.—WILLIAM C. BANKS, Como depot, Miss.—*Cotton Press.*—June 18, 1867.—The nut of the follower screw is attached to a beam oscillated between metallic guide-rods by a rope and winch. By this device the nut follower and sweep are carried aside to allow introduction of cotton.

Claim.—In combination with a cotton press substantially such as described, the pivoting at one end of the beam that carries the screw plates and sweeps, and the curved guide, or frame *F*, and windlass and cords, or their equivalents for moving said beam, substantially as and for the purposes herein described and represented.

65,866.—JOHN A. BASSETT, Salem, Mass.—*Hydrocarbon Fluid for Carbureting Gas.*—June 18, 1867.—The light distillate of coal is purified and mixed with the light distillate of petroleum.

Claim.—First, a hydrocarbon liquid used for the purpose above named, produced by the combination of the coal and petroleum hydrocarbons, as described and set forth.

Second, adding to the photometric value of gases by carbureting with the hydrocarbons produced by the combination of the light products of the distillation of coal and petroleum.

Third, the process substantially as set forth of manufacturing hydrocarbons for carbureting gases by combining the hydrocarbons of coal and petroleum in variable proportions as set forth.

65,867.—EDWARD M. BATES, East Rochester, Ohio.—*Corn Husker.*—June 18, 1867.—The fingers fit into the convolutions and the claw projects in apposition to the thumb.

Claim.—A curved or scroll corn husker, constructed in the manner and for the purpose described.

65,868.—F. A. DOLLES, Unadilla, N. Y.—*Corn Sheller.*—June 18, 1867.—The concave has a perforated bottom for the escape of the grain, and is stud-

ded with teeth. The toothed roller is journaled in metallic sockets supported by enclosing rubber disks to allow accommodation in the roller to the size of the ears.

Claim.—Combining with a stationary concave a yielding shelling cylinder, by means of springs as shown and described; said springs may be made of rubber or steel or any other suitable material, when constructed as and for the purpose as herein specified.

65,869.—WALTER J. BRASSINGTON, Brooklyn, N. Y., and WILLIAM B. BURTNETT, New York, N. Y.—*Supplying Locomotive Tenders with Water.*—June 18, 1867.—A vacuum, formed by the condensation of steam admitted from the boiler, introduces water to the main tank from a reservoir beside the track, through a removable suction pipe. The same devices may be applied to a fixed tank to alternately fill and empty the same, acting as a compound suction and force pump.

Claim.—First, an air tight tender tank of a locomotive engine, provided with a pipe communicating with the locomotive boiler, also with devices for attaching a pipe which is designed to lead into a reservoir or well of water, for the purpose of supplying said tank with water, substantially as described.

Second, the combination of the secondary air tight water tank *E*, and its spray pipe *f*, with the primary tank *C*, substantially in the manner and for the purposes described.

Third, the arrangement with an air tight tender tank *C*, and pipes *A* and *D* of reservoir *G*, which is constructed to operate substantially as specified.

65,870.—ALEXANDER BROOKS, Waverly, N. Y.—*Washing Machine.*—June 18, 1867.—The beater is oscillated over the curved bottom, its frame being weighted at the upper end to make the action more effective on the breast beams at each stroke. The bottom has channels by which the water may be conveyed to the exit hole.

Claim.—First, the combination of the circular slats or ribs *B*, circular plates *C*, and breast beams *D*, with each other, and with the box *A* of the machine, substantially as herein shown and described and for the purpose set forth.

Second, the pivoted hammer *E*, and weight *H*, constructed, arranged and operated substantially as herein shown and described, in combination with the box *A*, as and for the purpose set forth.

65,871.—JAMES W. BROWNE, New York, N. Y.—*Pocket Sun Shade.*—June 18, 1867.—The sun shade is used on an ordinary hat, its inner elastic band securing it to the same.

Claim.—First, the annular folding sun shade, constructed substantially as herein set forth and for the purpose specified.

Second, in combination with the annular folding sun shade, the elastic inner edge, substantially as herein set forth for the purpose specified.

65,872.—SAMUEL G. CABELL, Quincy, Ill.—*Air Pumps for Marine Alarm.*—June 18, 1867.—The frame stands transversely on deck and the roll of the vessel oscillates the pendulum; the latter works the segments operating the plungers and sounds the pressure and vacuum whistles. The plungers work in an annular water space.

Claim.—The double acting air pump, constructed substantially as described, and charged with a dense fluid packing, in combination with the draft and blast whistles *G I*, substantially as and for the purpose set forth.

65,873.—SAMUEL G. CABELL, Quincy, Ill.—*Copying Press.*—June 18, 1867.—The roller between the legs of the platen traverses in the eccentric groove of the lever.

Claim.—The slotted eccentric *E* and roller *a*, combined and arranged with relation to the platen *G* and bridge *H*, all constructed and operating substantially as herein set forth.

65,874.—THOMAS S. CLOGSTON, Boston, Mass.—*Steam Generator.*—June 18, 1867.—The generator is formed in a series of vertical sections, and has two large longitudinal pipes, with vertical and horizontal pipes, and each section has a curved pipe over the fire.

The large longitudinal pipes are divided by horizontal foraminous diaphragms.

Claim.—A boiler or steam generator, composed of one or more generators A, in which the upright or circulating flues, steam chamber or chambers, and lower arched flue are arranged substantially in the manner herein specified.

Also, the combination with the boiler or steam generator of the tubular casing surrounding the fuel supply door, substantially as and for the purposes set forth.

65,875.—B. C., T. W., and J. M. COCHRAN, Pana, Ill.—*Cultivator.*—June 18, 1867.—The plows are attached to iron frames, which are movable laterally and vertically by levers under control of the driver.

Claim.—First, the metallic frame D, with seat E, plates a, plow frames G G, and plows i i, all constructed, arranged, and operating in the manner and for the purposes herein specified.

Second, the shovel frames G G, arranged with rods H H' and m, for shifting the loops b b and levers F F', for elevating the shovels in the manner as set forth.

65,876.—CALEB CONDERMAN, Hornellsville, N. Y.—*Carriage.*—June 18, 1867.—The body is attached at the ends and at midlength to longitudinal side springs, and the seat supported on circular springs thereon.

Claim.—The springs E in combination with the body or frame A, substantially as and for the purpose described.

65,877.—GEORGE W. COOPER, Ogeechee, Ga., assignor to himself and JAMES V. JONES, Herndon, Ga.—*Rice Cultivator.*—June 18, 1867.—The plow beams are adjustable laterally to the rear of the frame. The plows are attached to standards having brace bars running from their lower ends, and are followed by curved teeth.

Claim.—First, the combination and arrangement of the braces F F' F', the beams A B B', and the braces G G, substantially as and for the purpose described.

Second, the method above described of fastening the teeth E E E to the beams by two bolts, situated obliquely to the grain of the wood, substantially as and for the purpose specified.

Third, the inclining and bending of the cultivator teeth E E outward and backward upon the point of attachment to the beams A B B', substantially as and for the purpose described.

65,878.—G. A. COVER, Macomb, Ill.—*Meat Mangle.*—June 18, 1867.—The roller has a roughened surface counterpart to that of the bed to which it communicates motion.

Claim.—A meat mangle, consisting of the corrugated roller R, provided with the cogs e and the sliding plate B provided with the cogs a, and having its surface roughened when arranged to operate as described.

65,879.—JAMES B. CRANE, Dalton, Mass.—*Manufacture of Belting.*—June 18, 1867.—Explained by the claim.

Claim.—As a new article of manufacture, a belt for machinery, formed of paper with or without cloth, substantially as herein shown and set forth.

Second, the use of paper for belt-lacing when formed substantially as herein described.

65,880.—ALEXANDER ANGUS CROLL, London, England.—*Purification of Coal Gas.*—June 18, 1867.—Sawdust is carbonized by concentrated sulphuric acid at a temperature of 270° Fah., and used in dry lime purifiers, 1 part of sulphate of lime may be added to 2 parts of the former composition.

Claim.—The employment in the purification of coal gas of wood or vegetable matter, when carbonized substantially as herein described.

Also, the employment of sulphate of lime in combination with the said carbonized matter, substantially as and for the purpose described.

65,881.—J. H. CRUMB and L. SEARS, Do Ruyter, N. Y.—*Cheese Vat.*—June 18, 1867.—The water heaters are of cast iron; the sides are corrugated, and

have a float which acts on a cock in the water pipe to keep the heaters filled to a certain level.

Claim.—The employment of cast iron heaters B, in combination with pipe b, hot water jacket c, and milk vat C c, constructed substantially as and for the purpose set forth.

The float f, in connection with supply pipe and valve d e, heaters B, and milk vat C, as and for the purpose herein described.

65,882.—GEORGE E. CUMING, La Fayette, Ind.—*Car Coupling.*—June 18, 1867.—The chamber behind the mouth of the drawhead is open below, and the mouth is slotted vertically and longitudinally through its lower side to admit the central portion of the coupling shackle. The head of the shackle rests in the chamber and its shoulders engage the shoulders of the mouth on each side of the slot. The head rests on a frame supported on a spring which is depressed to uncouple and allows the head of the shackle to drop out beneath.

Claim.—The combination in an automatic car coupling of the drawhead A, hinged piece B, stirrup C, and spring supporting the same with the shackle bar D, said parts being respectively constructed and arranged substantially as set forth.

Second, the drawhead A, when constructed with an opening through its lower side at A², for the escape of the shackle bar, substantially as described.

Third, the hinged piece B, when constructed and used in combination with a drawhead and shackle bar, substantially as described.

65,883.—A. W. DAVIES, Cleveland, Ohio.—*Computing Machine.*—June 18, 1867.—The chains consist of a series of plates and are moved in one direction by reference to the figures on the strip above them in accordance with the number to be added. The rows of figures denote units, tens, &c. The wheels on which the chains revolve are decimally connected and the sum is shown at the row of openings.

Claim.—First, the series of reciprocating cams H, and pawls G, in combination with the ratchet wheels F, and pin a, arranged and operating conjointly with the endless chains J, substantially as and for the purpose set forth.

Second, the lever M, and pawl G, as arranged in relation to each other and the ratchet wheel in disengaging or breaking the connections of one chain from the other for the purpose set forth.

Third, the endless belt or chain composed of sections corresponding to the faces or sides of the master wheels, and so arranged as to operate conjointly with the figure wheels, substantially as and for the purpose specified.

65,884.—SAMUEL DAVIS, New York, N. Y.—*Condensing Noxious Vapors from Lard Rendering, &c.*—June 18, 1867.—The vapors from the kettle are conducted by a pipe to a condensing coil in a cistern of cold water, and the condensed moisture therefrom is discharged with the overflow water of said cistern.

Claim.—First, the arrangement of cistern A, the coil B, and the pipes C E D, and F, in combination with a kettle or boiler for the purposes herein described.

Second, discharging a stream of water into the discharge pipe of a boiler for the purpose of increasing the draft from the boiler, substantially as described.

65,885.—THOMAS S. DAVIS, Jersey City, N. J.—*Steam Engine Governor.*—June 18, 1867.—The scroll is moved by the governor and actuates a rod connected with a link or other valve or cut-off motion; the thrust of the scroll being in the line of its diameter to steady the adjustment under circumstances of vibration, &c.

Claim.—The combination of the plate G, having a scroll H, with the bar I, pin a, arranged to operate across or at right angles or nearly so to the same, substantially as and for the purpose described.

65,886.—ALFRED B. DAY, Oak Creek, Wis.—*Insulator for Telegraph Wires.*—June 18, 1867.—The wooden plug into which the screw of the hook is secured is insulated from the iron cylinder by the interposition of non-conducting material.

Claim.—First, the lugs B and F, made of glass or other suitable non-conducting material in combination with the wooden plug C, on the inside of the cast iron cylinder A, all made and operating substantially as herein shown and described.

Second, so constructing the shell A, that the cap G can be held down by the cross head I, when the insulator is attached to the same, all as herein shown and described.

65,887.—NOEL B. DEVOL, Marshall, Ill.—*Treadles for Sewing Machines and other Purposes.*—June 18, 1867.—The supplementary treadle is connected to an arm whose pawl actuates a ratchet on the crank shaft and acts to start the same; the arm is held in an initial upward position by a spring. The ratchet and pawl prevent backward movement of the crank shaft.

Claim.—The ratchet wheel H, secured to the crank shaft B, of a sewing machine arm I, having spring pawl P, pitman rod K, supplementary treadle J, and spring M, or its equivalent, when all combined and arranged together so as to operate substantially as and for the purpose described.

65,888.—CHARLES DUMMELDINGER, Cleveland, Ohio.—*Roof for Railroad Cars.*—June 18, 1867.—The bent up ends of the adjacent metallic sheets are lapped by scroll pieces and the whole enclosed by a sheath which covers the joint.

Claim.—The stay bands E, tubular ends C, as arranged in combination with the sheath F, and car roof A, for the purpose and in the manner set forth.

65,889.—DANIEL DUNCAN and E. R. RIDGLEY, Olney, Ill.—*Combined Sower, Planter, and Cultivator.*—June 18, 1867.—Combines the actions of a roller, cultivator, and seeder. The seed slide is actuated by cam-frames on the lower end. The shaft to which the drills are attached is in two parts, either of which may be separately moved by levers, to raise the teeth from the ground.

Claim.—First, the shaft G, having the fixed armature H, working the secondary bottom of the seed box D, and having the sliding armature K, regulated by means of the lever and treadle I, substantially as and for the purpose described.

Second, the ring F on the end of the roller E, provided with projecting arms *ffff*, substantially as described.

Third, the division of the shaft M M', to which are attached the drill teeth, into two equal parts M and M', independent of each other and regulated by means of their respective treadles *n n'*, substantially as and for the purpose described.

Fourth, the combination and arrangement of the spring L, the secondary bottom of the seed box, the shaft G, with its two armatures K and H, and the roller E, having the ring F, with its arms *ffff* attached, substantially as and for the purpose specified.

Fifth, the combination and arrangement of the drill teeth attached to the shafts M M', the seed box D, and the rollers E E', substantially as and for the purpose specified.

65,890.—JAMES H. DURHAM and SANFORD RISING, Lafayette, Ind.—*Sash Supporter.*—June 18, 1867; antedated December 18, 1866.—The rubber cam is eccentrically journaled to the sash and is rotated into contact with the casing, so as to hold the latter up or down, according to the adjustment.

Claim.—A rubber cam, having a V-shaped recess, wherein is placed the spring E, as constructed with screw pivot G passing through the collar C, with a wing *c* for spreading the spring, when arranged between the plates A, in the manner and for the purpose set forth.

65,891.—CHARLES C. DUPUE, Wayne, Mich.—*Wagon-spoke Machine.*—June 18, 1867.—The spoke is clamped between the dog in the bent lever and the opposite cutter; the clamp lever is held in position by a support placed under it and upon the bench.

Claim.—Securing the spoke in position to be acted upon, by means of the pivoted dog B, substantially as herein shown and described.

65,892.—WILLIAM G. ESSER, Milwaukee, Wis.—*Compound for Tempering Steel.*—June 18, 1867.—

For tempering stone-cutting tools, as mill picks, &c. Equal parts carbonate of potash, saltpeter, and sea salt, dissolved in soft water.

Claim.—A compound for tempering steel tools, composed of the above ingredients in about the proportions named.

65,893.—WILLIAM H. EVANS, Richmond, Ind.—*Straw Cutter.*—June 18, 1867; antedated June 10, 1867.—Feed motion is communicated by a cam on the main shaft, which oscillates an arm operating pawls engaging ratchet wheels on the feed roller shafts. An adjustable stop bar regulates the back movement of the oscillating bar, which movement is accomplished by a spring.

Claim.—First, the rock shaft E, slotted arm F, pawls 1 and 2, and spring L, in combination with the eccentric wheel D, and feed-roller ratchets J and K, arranged and operating substantially as set forth and described.

Second, the stop G, arm or lever H, and rack I, in combination with the rock shaft E, as and for the purpose set forth.

65,894.—CHARLES R. EVERSON, Palmyra, N. Y.—*Fastening for Paper Collars.*—June 18, 1867.—The elastic loop is engaged to the collar of the neck band and the plate behind; the collar has a hinged clasp, whose free end enters the button holes of the collar.

Claim.—A fastener for collars, composed of plate B, having a clasp D hinged to it, and provided with a loop G, substantially as described.

65,895.—C. J. FAX, Philadelphia, Pa.—*Belting.*—June 18, 1867.—Improvement on the patents of T. Irving, J. McNeil, Geo. W. Rich, and Cyrus J. Fay, December 18, 1866. The belt is formed of paper strips, formed from manilla hemp, and attached together in layers by rubber cement.

Claim.—The use of and the manner of arranging paper for belts and straps, substantially as described.

65,896.—CHRISTOPHER C. FELLOWS, Center Sandwich, N. H.—*Vegetable Lifter.*—June 18, 1867.—The wire is bent into a circular spring at the holding end, and the free ends are bent into spirally formed recesses to hold the egg.

Claim.—The new manufacture of egg or vegetable lifter, made as hereinbefore described, viz: from one piece of wire bent at its middle, and also bent at or near its two ends in conical spirals or helices, as set forth.

65,897.—ALBERT FICKETT and JUSTIN C. WARE, Titusville, Pa.—*Device for Measuring Liquids.*—June 18, 1867.—The tank has a vessel within it of known measure which communicates with the barrel by openings stopped by a valve operated from the outside. The vessel has a discharge faucet and a transparent tubular indicator.

Claim.—First, the arrangement of the vessel B, secured within the tank A, and used in connection with a valve and stop cock, substantially in the manner and for the purpose specified.

Second, in combination with the above an indicator, arranged as and for the purpose specified.

65,898.—ORLANDO V. FLORA, Madison, Ind., assignor to himself and WILLIAM A. COLLINS, same place.—*Vise.*—June 18, 1867.—The rear jaw is pivoted to its support in which the ratchet bar slides, and the rear of this jaw is turned down into an edge to engage the said ratchet. The front jaw is pivoted to the lower end of a vertical pin traversing the head of the ratchet bar, and having at the upper end a nut engaging the clamping screw of the vise. The front jaw oscillates on this pin to accommodate itself to inclined surfaces.

Claim.—First, the rear jaw D, constructed substantially as herein described, in combination with the support B and sliding bar C, as and for the purpose set forth.

Second, the front jaw G pivoted at its lower end to the lower end of the vertical pin, bearing the nut F, and fitting in the vertical hole of the sliding bar C, as herein set forth for the purpose specified.

Third, the combination and arrangement of the front jaw G, short screw H, nut F, and sliding bar

C with each other, substantially as herein shown and described and for the purpose set forth.

Fourth, the combination of the key J with the end of the sliding bar C, and with the pivoting pin of the nut F, substantially as herein shown and described and for the purpose set forth.

Fifth, the combination of the support B, sliding bar C, and jaws D and G, with each other, substantially as herein shown and described, and for the purpose set forth.

65,899.—CONRAD GEORGE, Ligonier, Pa.—*Churn*.—June 18, 1867.—The churn has a foraminous, transverse vertical partition at its midlength, each division having a vertically reciprocating dasher whose perforated "valves" are oscillated so as to fill the cavity of the churn in their down stroke, and force the cream through their own perforations and those of the partition.

Claim.—First, the combination of the double alternating levers J K L, and the partitioned churn box A, all arranged substantially as and for the purpose set forth.

Second, arranging the levers J K L in a diagonal position as shown for the purpose of bringing the working ends of the levers K L over the centers of the churn divisions A A', as and for the purpose set forth.

Third, the combination of the perforated dashers provided with the valves R R and S S, having the movements described, with the partition B, furnished with the holes b' b', and beveled slits c' c', substantially as and for the purpose set forth.

65,900.—ARTEMAS W. GODDARD, Clinton, Mass.—*Caliper Rule*.—June 18, 1867.—The caliper blades are folded into the rule similarly to a knife blade. When the diametric gauge is taken its measurement is determined by the sliding scale within the rule, which is drawn out therefor.

Claim.—First, the blades a, when arranged as and for the purpose described.

Second, the combined caliper and slide gauge rule, when arranged substantially as and for the purpose set forth.

65,901.—JOHN GOLDING, New York, N. Y.—*Life Preserving Mattress*.—June 18, 1867.—Explained by the claim and illustration.

Claim.—The life raft constructed as described, consisting of the cork mattresses or floats, secured together by means of the spring hooks a, and staples b, as herein set forth for the purpose specified.

65,902.—D. R. GOULD, Chestertown, N. Y.—*Window Sash*.—June 18, 1867.—The strips of metal are attached to the face of the sash and enter grooves in the stiles to act as weather strips.

Claim.—The strips C C, secured upon the face of the sash by means of screws, in combination with the grooves d d in the frame, as and for the purposes set forth.

65,903.—W. G. GRANT, Clyde, Ohio.—*Pessary*.—June 18, 1867.—Explained by the claim.

Claim.—A sponge pessary, made of conical shape A outside, and provided with the hollow B, substantially as described for the purpose specified.

65,904.—THOMAS GRIFFIN, Roxbury, Mass.—*Floor Cloth*.—June 18, 1867.—The body of the cloth is of paper, covered on each side with fibrous material and sized. It is then painted with water colors and varnished. It is reversible.

Claim.—A floor covering or imitation oil cloth, made substantially as herein described.

65,905.—REUBEN HAMLIN, Mishawaka, Ind.—*Clothes Dryer*.—June 18, 1867.—The joints in the radial arms admit of their assuming a vertical or horizontal position, being in the latter case supported at their free ends by the brace wires.

Claim.—The combination of one or more sets or tiers of jointed radial arms D and the supporting or connecting wires E and F, or their equivalent, with each other, and with the central shaft A, substantially as herein shown and described and for the purpose set forth.

65,906.—C. HARRIS and P. W. ZOINER, Cincinnati, Ohio.—*Convertible Stove Door and Fender*.—June 18, 1867.—The plate has two sides, projecting rectangularly from each other at the ends, and of different breadths, so that the draft may be admitted over the plate while in one position, but stopped off from the fire bottom in the other.

Claim.—First, the convertible stove door and fender, substantially as set forth.

Second, the arrangement of convertible door and fender A B F, and hearth depressions D and E, substantially as represented and described.

65,907.—C. B. and G. W. HART, Victor, N. Y.—*Combined Milk Rack and Fruit Dryer*.—June 18, 1867.—The supporting bars are pivoted so as to stand edge up and allow ventilation when used for milk. When used for fruit the free edges of the slats are supported on the wedge bars, and they have narrow passages between them for circulation of air.

Claim.—The combined milk rack and fruit dryer, provided with loosely pivoted slats forming the shelves, capable of being opened or closed by the wedge bar beneath, the whole constructed and arranged as described, and operating in the manner set forth.

65,908.—CHARLES T. HARVEY, Tarrytown, N. Y.—*Elevated Railway*.—June 18, 1867.—The track is erected on pillars. The rails rest on string pieces which have an iron shell, strengthened by central wooden strips and metallic braces. These supporting pieces rest on rubber blocks to deaden the sound.

Claim.—First, the combination of the rail plates or supports J J with the rails I and bars M, when constructed and arranged substantially in the manner and for the purpose as herein described.

Second, the elastic plates or springs R, in combination with the rails, constructed and arranged substantially in the manner herein described.

Third, the platform frame E, with its upright ends or flanges O, in combination with the rails, constructed and arranged substantially as herein described.

65,909.—CHARLES T. HARVEY, Tarrytown, N. Y.—*Elevated Railway*.—June 18, 1867.—The car track is supported on brachial columns standing in single file and stayed by rods from the buildings. The propelling chain runs in a cable guide in the middle of the track, and is conducted down to the propelling drums, passing over pulleys and through the hollow column.

Claim.—First, the combination with the track of an elevated railroad of an open or transparent floor beneath the rails, so as to allow the transmission of light to the space beneath the railroad, substantially as set forth and described.

Second, the panels D, in the columns A, for the purpose of closing the openings in the lower part of the said columns, and also to strengthen the columns, substantially as set forth and described.

Third, the adjustable column A, made in the divisions a b, substantially as described.

Fourth, the wedge-shaped rings C, or their equivalents, in combination with the adjustable column A, substantially as described.

Fifth, the hollow supporting columns A, in combination with an elevated railroad, substantially as and for the purposes described.

Sixth, the pulleys T, in combination with the supporting columns A, substantially as and for the purposes described.

Seventh, the combination of the stay rods V with the elevated railroad, said stay rods connecting said railway to the buildings or other supports on the streets, and forming also awning-frame supports, substantially as set forth.

Eighth, a filling of wood, or equivalent material, in combination with said columns, substantially as and for the purposes described.

Ninth, the water trough along the track and its discharge pipe, in combination with an elevated railway, substantially as and for the purposes described.

65,910.—JAMES HATFIELD, Cleveland, Ohio.—*Carriage*.—June 18, 1867.—The spindle of each wheel is supported by a rectangular stay which turns on pivot screws of a frame at the end of the axle. The fore stays are so connected to an arm projecting back-

wards from the tongue that the oscillation of the latter causes the necessary inclination of the wheels. Diagonal bars from the cross-rail of the tongue operate similarly on the wheels of the rear axle, to give them a contrary direction.

Claim.—First, the centers *a'*, constructed with radial arms *b*, in combination with the bands B, spoke *d*, and keys *f*, substantially as and for the purpose described.

Second, the wheel B, spindle C, as arranged in combination with the stays D, boxes E E', for the purpose and in the manner as set forth.

Third, the cross-rail K, arm L, links L', and brackets M, in combination with the stay D and screw G, as and for the purpose substantially as herein described.

Fourth, the stay D, screw pins I G, in combination with the spindle C, axletree A, substantially as and for the purpose set forth.

Fifth, the adjusting screw O', coupling O, and reach K', arranged substantially as and for the purpose set forth.

65,911.—WILLIAM M. HENDERSON, Philadelphia, Pa.—*Steam Pump.*—June 18, 1867.—The action is direct, the pump plunger forming the piston rod. The air chamber is annular and surrounds the plunger cylinder. The valve stem has a horizontal slot to allow the transverse movement of its operating wrist pin. The wrist pin of the fly wheel is connected to the piston rod by a collar thereon.

Claim.—First, the arrangement of the pump steam cylinder and housing as described.

Second, the arrangement of a vacuum chamber enveloping the pump canal, substantially in the manner and for the purposes represented.

Third, the arrangement of the cross-head arm E, connecting rod F, eccentric pin shaft K, and slot-headed valve stem J, when constructed and operating conjointly in the manner and for the purposes herein set forth.

65,912.—R. W. HOWARD, Warwick, R. I.—*Amalgamator.*—June 18, 1867.—The pulp from the inner pan passes through holes in the sleeve hub, thence between the rubbing surfaces and into the annular trough of the outer pan, where it is incorporated with the quicksilver by the short flanges on the exterior of the inner pan; the lighter portions are raised by other flanges and are returned to the pan.

Claim.—First, the stationary or fixed pan A, having its bottom provided with radial grooves *a*, and an annular gutter or trough B around its edge, in combination with the rotating pan E, fitted within A, and provided at its exterior with flanges I, J, and holes *h* in its upper part, and provided at its center with an upright hollow hub F, having holes *g* in its lower part to admit the pulp down between the bottoms of the two pans, all arranged substantially as and for the purpose specified.

Second, the adjustable jacket G, on the hollow hub F, operated by the screw H, in combination with the fixed plate K, in the pan E, substantially as and for the purpose set forth.

65,913.—HENRY HOWE, Oronta, N. Y.—*Bolt Trimmer.*—June 18, 1867.—Explained by the claim and illustration.

Claim.—The cam-shaped sharply-beveled knife C D, pivoted to and in combination with the bar A B, having a hole in B to receive the object to be trimmed by the knife C D.

65,914.—JOHN HUGHES, Edgewater, N. Y.—*Furnace for Burning Pyrites for the Manufacture of Sulphuric Acid and for other purposes.*—June 18, 1867.—The kilns are made circular in transverse section and in form of an inverted truncated cone. The front side has a heavy iron plate extending from the bottom to near the top, and having a vertical series of openings closed by sliding doors. Around the openings are inwardly projecting flanges, the cavities between which are filled with fire bricks.

Claim.—Constructing a furnace for burning pyrites or sulphurets of iron, copper, zinc or other metals, without the aid of fuel, in the form of an inverted truncated cone, without grate bars, and provided with doors on the front side, ranged one above the

other from top to bottom, substantially as and for the purpose set forth.

65,915.—AARON HUYCK, Oortown, Wis.—*Churn.*—June 18, 1867.—One dasher is carried on a sleeve upon the other dasher shaft, and they receive motion in opposite directions from bevel pinions engaged by a common bevel wheel. The upper journal bearing of the dasher shaft is in a removable dasher.

Claim.—First, in the bridge D, stepped in loops C C, and provided with the box F, secured by thumb screws L, all constructed and arranged as set forth.

Second, the bridge D, post N, shafts E I, pinions J G, driver B, and shaft N, constructed and arranged as set forth.

65,916.—FRANCIS L. KING, Worcester, Mass.—*Egg Cutter.*—June 18, 1867.—The vertical shafts have thin metallic cutters, which pass in the intervals of those of the opposite shafts, and are presented edge-wise to the eggs. They are revolved by their pinions and a master wheel.

Claim.—The combination of two or more cutter shafts B, having cutters E, attached, with the gearing C D E, arranged and operating essentially as set forth.

65,917.—GAMALIEL KING, Westfield, Mass., assignor to himself and CHARLES C. PRATT, same place.

Covering Whips.—June 18, 1867.—The whip has an elastic, water proof composition beneath the outer covering, composed of caoutchouc, 2 lbs., dissolved in 1 gall. benzine, to which may be added $\frac{1}{2}$ lb. white lead, a little linseed oil.

Claim.—First, a waterproof coating, consisting of the ingredients herein shown and described.

Second, the application of the dissolved caoutchouc, with or without the lead and oil, to a whip, substantially as and for the purpose shown.

65,918.—JOSEPH KOEHN, Canton, Ohio.—*Cultivator.*—June 18, 1867.—The diagonal bars act as braces to the main frame, and also conform to the obliquely receding relative position of the shovels. The frame is raised or lowered by the oscillation of the bent axles, which adjustment is made by hand levers.

Claim.—First, the frame A, with diagonal bars A' A', for connecting the shovels D D, when constructed in the manner and used for the purpose set forth.

Second, the arrangement of the lever *e*, spring *t*, pin *z*, in combination with the axle *b*, rack *s*, for the purposes specified.

65,919.—CHARLES KORN, Wurtsborough, N. Y.—*Machine for Dressing Leather.*—June 18, 1867.—Improvement on his patent June 25, 1861. The knives are secured to an endless apron, and are cleaned and sharpened by devices which are attached to the sliding block, and are adjustable to knives of different sizes. After acting on a knife they return to position to operate on the next one.

Claim.—First, the sharpeners *f* and *i*, when arranged on a sliding block G, either separate or in combination with the cleaner *e*, all made and operating substantially as herein shown and described.

Second, the knife or knives E, when secured obliquely upon an endless apron, and when arranged in combination with the obliquely set frame F F', and grooved block G, in such manner that the said block is moved by the knife, substantially as set forth.

Third, the up and down adjustable frame F F', in combination with the sliding block G, and knife or knives E, all made and operating substantially as herein shown and described.

Fourth, the block G, and the knife or knives E, in combination with the spring *m*, and frame F F', all made and operating substantially as herein shown and described.

Fifth, the knife or knives E, when arranged on an endless apron A, in combination with the sliding block G, and sharpeners *f* and *i*, and cleaner *e*, all made and operating substantially as herein shown and described.

65,920.—THOMAS H. LINDLEY, Taunton, Mass.—*Filing Machine.*—June 18, 1867.—On the upright frame are two sliding carriages, supported in adjustable standards, and receiving vertical movement by a crank. An operating table supports the article

under treatment between the carriages to which the file is attached.

Claim.—The combination of the sliding carriages C C', supported in the adjustable bearings B B, and operated by the wheel i, and the adjustable table m, supported and applied substantially in manner and for the purpose as set forth.

65,921.—THOMAS H. LIDFORD, North Adams, Mass.—*Steam Valve.*—June 18, 1867.—The pieces of the valve are formed by the oblique section of a cylinder. They have a general motion together, but when one reaches the end of its range the upper one is crowded upon it so as to jam the circular faces of each against the seats above and below, respectively.

Claim.—The arrangement of the wedge-shaped pieces D and E, with reference to the shaft G and collars d and e, substantially as described.

65,922.—ALBION H. LOWELL, Manchester, N. H.—*Apparatus for forming Molds for Purposes of Casting Metal.*—June 18, 1867.—The flask containing the sand is carried automatically into a position to receive the impression of the pattern which is forced into the sand and then withdrawn, after which the flask is carried out of the machine.

Claim.—In combination with the pattern attached to the plunger, as set forth, the endless chains C, the plates s, the stops or bars t u, the tube or punch c', and the flask F, as above set forth and described, and for the purpose of making molds for castings.

65,923.—ALEXANDER MACKAY, New York, N. Y.—*Centrifugal Machine for Drawing Sugar.*—June 18, 1867.—A spiral plate, suspended by brackets from the outer case, scrapes the sugar from the vicinity of the revolving wire cylinder and distributes it in the pan.

Claim.—First, the combination with the centrifugal cylinder of a stationary distributor, arranged within the cylinder on one side of it, adjacent to the feed, and operating substantially as specified.

Second, the stationary distributor C, constructed essentially as shown and described, in combination with the centrifugal cylinder B, and arranged in relation thereto, as herein set forth.

65,924.—C. G. MARSHALL, Florence, Mass.—*Forming Emery Wheels.*—June 18, 1867.—Composed of glue, emery and concrete lime swaged into form between dies.

Claim.—The use of concrete lime or cement in the formation of emery wheels, substantially as and for the purpose herein set forth.

65,925.—G. B. MASSEY, New York, N. Y.—*Car Wheel.*—June 18, 1867.—The annular tread slips on to the hub, and is clamped by a face plate against the disk, whose edge forms the flange of the wheel.

Claim.—First, a car wheel composed of the disk A, having the solid hub A' with the disk B fitted to turn loosely on the hub and held thereon by the cap C, as set forth.

Second, the car wheel, consisting of the disk B, provided with the flange e, in combination with the disk A, having the solid hub A', said disks A and B being held together by means of the cap C, substantially as described.

65,926.—JULES FRANÇOIS MATHIAS and DESIRÉ MATHURIN LEGAT, Paris, France.—*Machine for Coating Hats.*—June 18, 1867.—The hat frames, coated with glue, are laid on elastic supports, and are coated, powdered, and dried without removal therefrom. The shafts from which the supports spring receive a slow, rotary, and a rapid reciprocating motion in a closed chamber, so that the inner and outer surfaces are exposed to catch the fibre introduced in an aerial current by a fan.

Claim.—First, we claim a machine for felting hats, made and operating substantially as herein shown and described.

Second, the hollow shaft K, combined and connected with the shaft H, by means of springs R R, substantially as herein shown and described.

Third, the beating apparatus with the spring Q, substantially as herein shown and described.

Fourth, the arrangement of the valve e and passage or conduit f, in combination with the channel F

and face B, all made and operating substantially as herein shown and described.

65,927.—GEORGE A. MCLHENNY, Washington, D. C.—*Manufacture of Illuminating Gas.*—June 18, 1867.—The accumulation of carbon in the retorts is prevented by relieving them from the pressure caused by sealing the mouths of their tubes in the hydraulic main during the process of distillation. The level of the water in the main can be raised or lowered by means of two cocks, respectively above and below the level of the mouths of gas tubes. The tar passes off by the lower cock while distillation is in progress, and when the retorts are opened the level of the liquid is raised by closing this cock so as to seal the mouths of the tubes temporarily.

Claim.—First, the prevention of the deposit of carbon in gas retorts by the means described or by any equivalent means.

Second, so arranging the pipes or tubes leading from the retort to the hydraulic main that the mouths of said pipes or tubes can be sealed or unsealed at pleasure.

Third, providing the hydraulic main of a gas factory with two or more pipes for the escape of the coal tar, when said pipes are arranged at different heights and provided with cocks so that the liquid contents of the main may be made to occupy a higher or a lower level therein, substantially as and for the purpose set forth.

65,928.—LEVI T. MCNEILEY, Danville, Mo.—*Identifying Box.*—June 18, 1867.—The address of the owner is placed in the box which is attached to the animal or package.

Claim.—An identifying box constructed substantially in the form herein described, for the purpose of identifying and aiding in the securing of lost animals and goods.

65,929.—ISAAC H. MCOMBER, El Paso, Ill.—*Weather Strip.*—June 18, 1867.—The door shuts over the strip, and the water which collects between it and the false sill passes off below the latter, which is supported on cleats.

Claim.—The arrangement of the false sill C with the grooved door cleats H H and the strip D, substantially as and for the purpose set forth.

65,930.—SAMUEL M. MECUTCHEN, Philadelphia, Pa.—*Adjusting Rollers.*—June 18, 1867.—Wedges are placed between the set screw and sliding bearing of the rollers; the screw may be relieved by driving out a wedge, should the former become jammed by excessive pressure.

Claim.—The arrangement, substantially as described, of the wedges, sliding bearing b, and set screw f with a rolling mill, for the purpose specified.

65,931.—JONATHAN MILLS, Des Moines, Iowa, assignor to himself, LEWIS J. BROWN, CHARLES S. SPOFFORD, and HENRY VAN LUTHERAN.—*Brick Machine.*—June 18, 1867.—The molds are in circular series extending through the thickness of the vertically-rotating mold wheel, and receive clay consecutively from the horizontal pug mill. The followers in the mold cells are actuated by a circular cam, which pushes the follower against the clay to press it against the smooth pressure plate; the follower is further advanced to expel the wick from the mold and drop it into the carrying board on the intermittingly-moving, off-bearing apron.

Claim.—First, the horizontal pug tub or mill, constructed and arranged substantially as described, in relation to the mold-wheel and the other parts of the machine, substantially as herein shown and described.

Second, dropping back the follower or relieving the brick of pressure, substantially as and for the purposes specified.

Third, the arrangement, substantially as shown and described, by which the apron is operated, as and for the purpose set forth.

65,932.—BENJAMIN MOSER and DAVID YELLOTT, Brooklyn, N. Y.—*Stud Fastening.*—June 18, 1867.—In attaching, the movable arm is brought parallel with the stationary one and both inserted in the button hole; the former is then rotated 180° and the spring

catch falls into a notch in the button to retain it in position.

Claim.—The fastening for buttons, &c., herein described, the same consisting of the arms D D² and spring, or other suitable catch, substantially as specified.

65,933.—GEORGE NELSON, Boston, Mass.—*Lamp Burner.*—June 18, 1867.—Explained by the claim and illustration.

Claim.—The combination with the jacketed wick tube and rack for adjusting the wick of the cap or deck forming the base of the jacket above the apertures through which the rack pin passes, such deck being depressed so as to constitute a cup, which gathers and holds the condensed vapor around and against the wick tube, as and for the purposes herein described.

65,934.—WILLIAM H. NEWBY, Seymour, Ind.—*Tanning Compound.*—June 18, 1867.—Composed of nutgalls, 1 lb.; sept-foil root, 10 lbs.; saltpeter, 1 lb.; oxalic acid, 1 lb.; Bengal catechu, 3 oz.; and water, 34 gallons.

Claim.—The tanning liquid composed of the ingredients in or about the proportions substantially as described.

65,935.—E. D. NORTON, Bradford, Pa.—*Lamp.*—June 18, 1867.—The gas is allowed to escape through wire gauze, which prevents the accidental conduction of flame to the oil chamber.

Claim.—A safety valve constructed and applied substantially as and for the purpose described.

65,936.—AMOS NUDD, Waupun, Wis.—*Melododeon, &c.*—June 18, 1867.—The sounding box is made of light wood and has one or more openings. It is secured to the keyboard on top of the case in rear of the bank of keys, and beneath the lid.

Claim.—In combination with the keyboard of a melodeon, or similar reed instrument, the sounding box C, arranged as shown and described.

65,937.—THOMAS NYE, Westbrook, Me.—*Rocking Chair and Trunk.*—June 18, 1867.—The rockers are hinged and folded into recesses in the sides of the trunk, and the lid retained by jointed arms to form a back.

Claim.—First, the movable back *a* and folding arms *b*, operating as described, and for the purposes specified.

Second, the rockers *s n*, when constructed so as to fold up, and also to fold into the recess, substantially as and for the purposes set forth.

Third, the drops *e* to hold upright the part *h* of the back, in the manner and for the purposes set forth.

Fourth, the double cover *m x*, when applied to the trunk body to close the recess, substantially as and for the purposes described.

65,938.—LORENZO D. PELTON and JOSEPH BARROW, Harrison, Ohio, assignors to themselves and ALEXIS GREEN, same place.—*Cultivator.*—June 18, 1867.—The wheel frame is detachable from the plow frame and the handles admit of vertical adjustment to suit a walker or rider. The plows are transversely and vertically adjustable, and their frame may be raised by a foot lever.

Claim.—First, a mode of construction whereby the wheels and secondary beam B may be detached, and by means of auxiliary bolt holes *c* in the handles C, and in the sheaths at *e'*, the handles lowered to a convenient height to be managed by an operator on foot.

Second, in combination with the elements of the clause immediately preceding, the provision of the described mechanism for lifting the plows from the ground, either temporarily to pass an obstacle J J', or more permanently to allow of moving the implement on a road or otherwise F F' H h and I, and the position of the seat, which enables the driver to control these levers and manage the plow handle.

65,939.—E. A. POND and M. S. RICHARDSON, Rutland, Vt.—*Machine for Producing Blast in Gas Carbureters and other Apparatus.*—June 18, 1867.—During rotation the convolute pipes take in alternate supplies of air or water, as their mouths are in one or the other fluid, and discharge the same within

the other compartment, where the air and water separate to pass through the upper and lower radial openings respectively. The air is conducted to the carburetting apparatus, and the water back to the other compartment through the opening at the lower part of the dividing partition.

Claim.—First, a vessel or case divided into two compartments, communicating with each other at or near the bottom of the vessel.

Second, a hollow shaft or arbor passing through the two compartments, having mounted upon the sides of the dividing partition a series of convolute tubes, and provided on the other side with one or more perforations, the said shaft being connected with suitable mechanism for rotating it.

Third, one or more suitable valves for the admission of air and pipes for the discharge of the compressed air or gas.

65,940.—TIMOTHY I. POWERS, New York, N. Y., assignor to J. P. FITCH and J. R. VAN VECHTEN, same place.—*Machine for Heading Cartridge Cases.*—June 18, 1867.—The cartridge blank is placed over the end of one of a series of upwardly projecting mandrels on an intermittingly rotating plate, and brought first under the adjustable reciprocating gauge screw, and then between the automatic grasping jaws, in which position the header descends upon it to form the flange.

Claim.—First, in cartridge heading machines the combination with the header J and shell mandrel or series of shell mandrels *h*, arranged and operating together, substantially in the manner described, of the sectional or divided die N, arranged to gripe or close round the shells on the mandrel or mandrels before and whilst the shell is being upset and headed, and afterwards to open for release of the latter, essentially as specified.

Second, the combination with the shell mandrels and header of an automatic gauge or shell adjuster, arranged so as to set the closed end of the shell to its proper position relatively to the upper or outer end of the mandrel in advance of the action of the header upon the shell, substantially as and for the purpose herein specified.

Third, in combination with a series of shell mandrels and suitable header, a shell take-off K, constructed to operate essentially as described, or in any other equivalent manner.

Fourth, the combination of the vertical side E, divided or sectional die N N and header J, with the locking and unlocking devices operating upon the sectional die, all constructed and arranged substantially as and for the purpose herein set forth.

Fifth, the fixed way M, in combination with the lever *q* for closing the sectional die by the movement of the slide E, which carries the said die, substantially as described.

Sixth, the slide L and stop *o*, in combination with each other, and with the levers *q* for opening the die and moving it out of the way of the header, essentially as herein set forth.

65,941.—JOWN PRICE, New York, N. Y.—*Forging Apparatus.*—June 18, 1867.—The hammer is caught and held at its highest position, when required to give more time to manipulate the work, or when the driving power is disconnected. By sliding the catch into engagement with the rack it will stop the hammer, the spring receiving the shock. The devices for operating the catch in the latter event are enumerated in the second claim.

Claim.—First, the combination with the hammer head of a rack spring and sliding catch, substantially as and for the purpose set forth.

Second, operating the sliding catch J by means of the lever *g*, which connects and disconnects the power for driving the hammer, the said lever *g* being connected for that purpose to the sliding catch J, by the arm *a*, rock shaft *b*, arm *e* and connecting rod or link *f*, or by their equivalents, in such a manner that the said sliding catch J will be thrown inward to catch the hammer, when the power is disconnected and drawn out to release the hammer when the power is applied by the lever *g*, substantially as and for the purpose set forth.

65,942.—THOMAS PROSSER, New York, N. Y.—*Machine for Grinding and Polishing.*—June 18,

1867.—The carriage has a longitudinal and lateral motion, and the work may be inclined in relation to the periphery of the grinder. By a rotating mandrel the work can be rotated while exposed to the operation of the grinder. Automatic feeding may be established by means of friction wheels.

Claim.—First, the combination of the wheels *s s'*, pawls *u w'*, friction wheels *p h*, and screw I, with the reciprocating carriage for establishing an automatic feed motion, substantially as described.

Second, the reciprocating carriage F, with its frame or vise G, made adjustable thereon, parallel or angularly to the axis of the grinding wheel, in the manner described.

Third, the friction gear wheels *h p*, made adjustable as regards their binding action, one upon the other, substantially as and for the purpose set forth.

65,943.—STEPHEN D. RADER, Williamsport, Pa.—*Brick Kiln.*—June 18, 1867.—The kiln has side chambers communicating with the ordinary furnace holes, and extending beyond the kiln at both ends, where they have furnaces. Furnaces are also placed at midlength. The outer wall of the chamber has small openings opposite the flues beneath the kiln.

Claim.—The peculiar construction and arrangement of furnaces B B and C C, when used in connection with the kiln A, as and for the purpose specified.

65,944.—HERMAN REINECKE, New York, N. Y.—*Escapement for Time Pieces.*—June 18, 1867; antedated June 10, 1867.—Combines the detached and lever escapements. The balance receives an impulse from the escape wheel while swinging in one direction, and is free from the power of the main spring during the other half of its stroke. The impulse produced by the escape wheel is transmitted to the balance by a lever.

Claim.—Pallets *p p'*, mounted on the oscillating arbor *b*, in combination with the lever C, lifting spring *f*, pins *d e g c*, and balance B, all constructed and operating substantially as and for the purpose described.

65,945.—JOHN R. RICHARDS, Mount Joy, Pa., assignor to himself and ALFRED L. MENUEZ, Cleveland, Ohio.—*Sectional Mold for putting up Buildings of Concrete and other Materials.*—June 18, 1867.—The molds are made in inner and outer sections, which sustain the joists and door and window frames, and between which the concrete walls are formed. The molds are perforated for admission of carbonic acid gas. Composition used, sand, 19; hydraulic lime, $\frac{1}{2}$; quick-lime, 2 bushels.

Claim.—A series of sectional molds A B, for the outer face, and another series H I, for the inner face of walls, in combination with the door, window boxing M N, strips K, dovetailed joists J J, all arranged substantially as united by flanges F, in the manner shown and described.

Also, in combination with my sectional molds, the open interstices, when made for the admission of carbonic acid gas, for the purpose specified.

Also, the proportions specified for making the composition when introduced between sectional molds, in the manner and for the purpose set forth.

65,946.—CHRISTOPHER RICHARDSON, Newark, N. J.—*Apparatus for Tempering Steel Plates.*—June 18, 1867.—The steel plates are compressed between the tempering plates in the oven. The said tempering plates are actuated by a winch outside the furnace.

Claim.—The combination of the plates C and D with the screw or screws K and the heated chamber U, or their equivalents, when combined and operated substantially as and for the purpose described.

65,947.—CHRISTOPHER RICHARDSON, Newark, N. J.—*Handsaw Frame.*—June 18, 1867.—Both ends of the saw enter the slots in the frame. The rear end is slotted to receive a transverse screw, and has also the usual tightening device.

Claim.—The improved method of holding saws in metallic saw frames, substantially as shown and described.

65,948.—HENRY E. RILE, New York, N. Y., assignor to ASA L. SHIPMAN, same place.—*Machine for*

Coating Paper with Mucilage, &c.—June 18, 1867.—The paper is placed on a sliding table and subjected to the action of the mucilage brushes, which are dipped in the reservoir below to renew their charge of gum. They are suspended from a frame, which is depressed by a treadle and raised by springs.

Claim.—A machine for coating paper, &c., in which are combined a frame carrying a series of brushes whether one or more in number, a platform or table, and a reservoir or receptacle for the liquid to be applied by the brushes, when all are combined and arranged together so as to operate substantially as described.

65,949.—HENRY R. ROBBINS, Baltimore, Md.—*Burglar Alarm.*—June 18, 1867.—The frame is attached by points to the jamb. The opening door touches the trigger and releases the two spring-piston hammers, which discharge the caps.

Claim.—The combination of the frame A, spring-piston hammers B B, lever catch E, hinged trigger D d, and spring g, constructed and operating substantially as described and represented.

65,950.—J. RUPP, New York, N. Y., assignor to himself and FREDERICK KIESER.—*Double-seaming Machine.*—June 18, 1867.—Improvement on the patent of Wilson, Green & Wilson, April 19, 1859.—The annulus to form the sides of the vessel is placed on the disk and the bottom blank rested on the out-turned edge of the side blank and a circular plate; a swivel plate, depressed by a weighted lever, rests on the bottom blank. The vertical rotary shaft is raised by a treadle, which brings the bottom in contact with vertical cone pulleys, whose sections of smallest diameter guide the plate, and the shoulders of the other sections in turn fold the bottom edge and the flange of the side; other rollers meanwhile pinching the seam to cause a tight double fold.

Claim.—First, the movable slide *d*, carrying the supporting plate *f*, in combination with the disk A, constructed, arranged, and operating substantially as and for the purpose described.

Second, the arrangement of three or more cone rollers *i* in the annular rim H, in combination with the rising and falling disk A, constructed, arranged, and operating substantially as and for the purpose set forth.

Third, the clamping roller *p*, in combination with the burring roller *o* and disk A, constructed, arranged, and operating substantially as and for the purpose described.

65,951.—S. SAMUELS, Mott Haven, N. Y., and W. J. BRASSINGTON, Brooklyn, N. Y., assignors to themselves, WILLIAM PITT, and W. B. BURNETT.—*Locomotive Engine.*—June 18, 1867.—The vacuum is created by the air pump in the tank of the tender to assist in inducting water into the same.

Claim.—First, the combination with the tank of a locomotive engine tender of an air pump, so arranged as to admit of being worked by the engine for the production of a vacuum in said tank, substantially as herein set forth.

Second, the combination with a locomotive engine and its tender of a pump, so arranged as to serve either purpose at pleasure of exhausting air from the tank to facilitate the supply of water to the latter, or of forcing water from the tank into the boiler, substantially as herein set forth.

Third, in combination with the water-supply pipe B and its stop-cock *d*, the air pipe D connected with the pipe B, in front of the said cock *d*, essentially as shown and described.

65,952.—WILLIAM SANDERSON, New York, N. Y.—*Cutlery.*—June 18, 1867.—The metallic frame of the handle is cast solid with the bolster and the scales attached to the rabbets therein.

Claim.—A handle, formed of a metallic frame, cast with or rigidly united to the bolster, and scales or side pieces, substantially as described.

65,953.—PETER F. SCHENCK, Riceville, N. J.—*Apparatus for Supplying Air to Life-boats.*—June 18, 1867.—The tubes open to the inside and outside of the vessel. The valves are of different specific gravities. The heavier one, of metal, closes against the entrance of water when the boat is in one position,

and the lighter one, of wood, closes it under other conditions.

Claim.—An apparatus, consisting of tubes containing ball valves of different specific gravity, adapted to operate in combination with a closed life-boat, for the purpose of admitting fresh air therein and excluding water therefrom, substantially as described.

65,954.—FREDERICK SCHMIDT, Cincinnati, Ohio.—*Wood-planing Machine.*—June 18, 1867.—The two sections of the cutter-head have side movement, for adjustment as wear takes place or to allow rotation in either direction.

Claim.—The elongated gains or depressions *e e*, in the two parts of a divided cutter, to enable the said parts to be set out in opposite directions, substantially as and for the purposes set forth.

65,955.—F. EMIL SCHMIDT, Hoboken, N. J.—*Manufacture of Ornamental Feathers.*—June 18, 1867.—The feathers are printed in colors and trimmed to shape.

Claim.—Ornamental feathers, which have been colored in a printing press and which are treated substantially as herein shown and described.

65,956.—JOHN SEE, Baltimore, Md.—*Composition for Roofing, Pavements, Walls, Docks, and other Structures.*—June 18, 1867.—Composed of pulverized iron ore, 50; hydraulic cement, 15; clean sand, 15; ground marble, 15; coal dust, 8; lime, 8; and salt, 4 parts.

Claim.—First, the composition formed of the materials named, substantially as and for the purposes herein specified.

Second, iron-ore turnings, borings, or filings, in combination with hydraulic cement, for the formation of roofing, pavements, walls, docks, water-bricks, pipes, and other structures, substantially as and for the purposes herein specified.

65,957.—FREDERICK SEYMOUR, Nashville, Tenn.—*Instrument for Opening Sheet Metal Cans.*—June 18, 1867.—The point is inserted in the metal, the adjustable cutter forced into the can and swept around to cut a disk therefrom.

Claim.—The new article of manufacture, consisting of the guard F in the described combination with the shaft A, handle B, elbow C, point D, and cutter F, whether stationary or adjustable.

65,958.—MICHAEL SIMONS, Middletown, Conn.—*Ice Pitcher.*—June 18, 1867.—The inside bottom slips up into the ice chamber and may be renewed. The lower bottom is slipped into place and secured by catches.

Claim.—The inside bottom P and the outside bottom G, with its devices H and L, when arranged and constructed as herein described and for the purpose set forth.

65,959.—DANIEL C. SMITH, Adrian, Mich.—*Fruit Ladder.*—June 18, 1867.—The hinged frame is mounted on wheels, and has a ladder inclined upward therefrom.

Claim.—First, a fruit ladder, as shown and described, with bars H, braces P, and handle U, as set forth in the specification and drawings, and in combination.

Second, the support N, or anything substantially its equivalent, for the purposes set forth and described.

65,960.—ABRAM C. STANNARD, Rock county, Wis.—*Washing Machine.*—June 18, 1867.—The clothes lie upon a series of rollers, and are acted on by a curved corrugated board oscillated by a handle-frame rigidly attached thereto.

Claim.—First, the straight-edged eccentrics J and J, when made substantially as described, and used to hold the working mechanism I P and K of a washing machine to any desired altitude within the washing-machine box A, and the whole combined and operated substantially as and for the purposes described.

Second, the general arrangement of box A, rollers S, arranged in frame R, washboard Q, and operating framework M P J K and U, kept to any desired altitude by means of the straight-edged eccentrics J and J, when the whole are constructed, arranged and

operated substantially as and for the purposes described.

65,961.—U. T. STEWART, Fayette county, Tenn.—*Cultivator.*—June 18, 1867.—The toothed seed bar is reciprocated by the pins on a shaft which is actuated by pins on the hub.

Claim.—The arrangement of the spring sword F F and the combination of plows and scrapers B B, two of the scrapers being chopping scrapers B B, so as to perform the work above specified.

65,962.—JAMES G. STODDARD and BENJAMIN F. GALLUP, Groton, Conn.—*Cylinder Press for Extracting Oil from Fish.*—June 18, 1867.—The rectangular frame has a revolving apron which runs between transverse cylinders carrying the substance to be pressed. The lower cylinder has grooves to contain the liquids expressed.

Claim.—First, the arrangement and combination of the cylinders C and D, the apron B, the hopper F, and the scraper or chute G, substantially as described and for the purposes herein set forth.

Second, the recesses *b*, in combination with the cylinders C and D, substantially as and for the purposes specified.

65,963.—JOHN SWAN, Baltimore, Md.—*Sleeping Car.*—June 18, 1867.—The passage way runs along one side of the car and the doors of the apartments open into it. Each state room has its wash bowl supplied with water from a reservoir above, running the length of the car.

Claim.—In a railway car of a series of state rooms, provided with side passage and independent ventilation, the combination and arrangement of reservoir pipes H H, and basins G in the state rooms, as and for the purpose specified.

65,964.—TAYLOR P. THOMPSON, Charlestown, Mass.—*Bed Bottom.*—June 18, 1867.—The slat ends are fitted to and play in rounded sockets, resting upon spiral springs therein.

Claim.—The combination with the slotted cylindrical sockets and springs contained within the same, of slats having heads or knobs on their end, fitting into the side sockets under the arrangement described, so that while the said slats are capable of a free vertical play, their heads shall at all times be held within the said sockets, as specified.

65,965.—DAVID B. TIFFANY, Xenia, Ohio.—*Tool for Jewelling Watches.*—June 18, 1867.—The plate is clamped in the jaws, the arm adjusted, and the set screw brought in the rear of the plate to support it. The tools are introduced through the tubular arm, which is adjustable in position.

Claim.—First, an adjustable arm through which the cutters work, secured to either side of the vise, substantially as and for the purpose set forth and described.

Second, an adjustable arm *d*, provided with a set screw *a*, and secured to the side of the opposite to the former, substantially as and for the purposes set forth.

Third, the combination of the two adjustable arms with circular tap *e* and nut *g*, operating as and for the purposes specified.

65,966.—GEORGE TOLLINGER, Wrightsdales, Pa.—*Sorghum Stripper.*—June 18, 1867.—Two pairs of scrapers are attached by spring bars to the board and embrace the stalk, which is drawn between them.

Claim.—The construction and arrangement of the ring-plate C and braces D D supporting the scraper blades *a a a*, which are secured to the yielding spring braces *d d d*, the whole being attached to the board or plank A, all in combination operating substantially in the manner herein described for the purposes set forth.

65,967.—CHARLES W. TROTTER, Rochester, N. Y., assignor to GOMMENGINGER & TROTTER, same place.—*Furnace.*—June 18, 1867.—The main body is surrounded by flues of triangular shape, a part connected with an inner chamber, and the remainder for constructing the calorific current around said chamber.

Claim.—First, the peculiar construction of the main body A, in connection with the inner body *a*, with

triangular flues $n n n n$, all in the manner and for the purpose herein described.

Second, a double radiator C, connections $o o$ and double damper k and l , with rod m ; also, two tiers of smoke pipes $d d d$ and $e e e$, all in the manner and for the purpose herein set forth.

65,968.—JOHN P. VERREE and W. A. MITCHELL, Philadelphia, Pa.—*Rollers for Rolling Old Rails.*—June 18, 1867.—The roll grooves are so arranged that when the rail enters the roll it turns the flanges toward and covers the center of the rail with metal from the flange and head, so as to form a bar of iron with the good metal of the flange and head outside.

Claim.—In three high rolls series of grooves in each roll, shaped substantially as described.

Also, grooves of the particular form represented by Figs. 1 and 2, produced respectively by the conjunction of the groove of one roll with the groove of another.

65,969.—JOHN A. WAGGONER, Kilgore, Ohio.—*Chimney Cowl.*—June 18, 1867.—The pendant wings oscillate the plate and cause it to deflect the wind from the smoke exit.

Claim.—The wings A, plate D, and sides E, when constructed and arranged in combination with a chimney, as and for the purpose set forth.

65,970.—JEREMY B. WARDWELL, Georgetown, D. C.—*Bedstead Fastening.*—June 18, 1867.—The dovetail tenon on the end of the rail plate is slipped into its seat in the plate, which is let into the face of the post, and is then locked by the edge of the rotating plate, which is closed against it.

Claim.—The mortise plate constructed with a rotating side to close upon the neck of the dovetail tenon of the rail, and to open to permit the withdrawal of the tenon, substantially as described.

65,971.—JOSEPH W. WATTLES, Canton, Mass.—*Ring Spinning Frame.*—June 18, 1867.—The ring socket in the rail is made somewhat longer than the neck of the ring entering therein to allow it to assume concentricity with the bobbin. Screws in the rail enter slots in the neck.

Claim.—In a ring spinning frame or machine, the application of the ring B to its support rail A in such manner that while the spinning of the yarn or thread and the winding of it upon the bobbin may be in the act of taking place, the ring may be free to be moved and centralized with respect to the bobbin, by the draft of the yarn on the traveler.

Also, the combination of the screws g and the slots f , or their equivalent, with the ring and its rail and with the ring-socket, so formed as to allow the ring to play diametrically as and for the purpose set forth, the purpose of such screws and slots being as hereinbefore explained.

65,972.—WILLIAM WEBB, Waterbury, Conn., assignor to the SCOVILLE MANUFACTURING COMPANY, same place.—*Hinge for Lamp Burners.*—June 18, 1867.—The stop piece limits the oscillation of the moving leaf on its pintle, and forms a rest for the chimney holder.

Claim.—The hinge A, having one of its leaves provided with a projecting rest or stop-piece D, and made substantially as herein described and for the purpose specified.

65,973.—MORITZIOUS WEISSBERGER, St. Paul, Minn.—*Printer's Ink.*—June 18, 1867.—A compound of mineral resin, hydro-carbon oil, and lamp-black.

Claim.—The printer's ink above described, compounded and used substantially as and for the purposes specified.

65,974.—SHEPHERD H. WHEELER, Dowagiac, Mich.—*Gate.*—June 18, 1867.—The outer end of the gate is lifted and pushed so that the inner end rides upward and backward on its rocker until balanced, when it is rotated 90°, together with its post.

Claim.—First, the frame E with its rocker A, in combination with the revolving post D, as and for the purpose herein specified.

Second, the combination of the frame E with the gate and its posts and the cleat x , or its equivalent, as and for the purpose set forth.

65,975.—CHARLES W. WHITE, Cincinnati, Ohio.—*Bed Bottom.*—June 18, 1867.—Spiral springs are attached to the ordinary slats and a frame placed thereon consisting of a series of transverse slats attached to two side slats.

Claim.—The combined arrangement of the two sets of transverse slats A and C, the springs B, side rails D D', and screws E, as and for the purposes set forth.

65,976.—THOMAS W. WHITE, Milledgeville, Ga.—*Seed and Guano Planter.*—June 18, 1867.—The drum is carried on the ground wheel, which forms one end to the same, the other end having a saw plate, whose teeth, in combination with adjustable pins projecting through it, serve to draw out the cotton seed or fertilizer from the hopper. The hopper mainly consists of a sack and has a hinged bottom-piece moved by a cam to agitate the contents. The bottom plate is adjustable to regulate the amount of seed dropped.

Claim.—First, the drum G having the internal movable disk T bearing the teeth $t t'$, and adjusted by set screws, or their equivalent, substantially as and for the purpose described.

Second, the saw H attached to the drum G, substantially as and for the purpose described.

Third, the bottom plate N, substantially as described.

Fourth, the hinged block K, operated by the cam L, substantially as and for the purpose specified.

Fifth, the combination and arrangement of the drum G, the movable disk T, the hinged block K, with the flexible bag attached to it, and the cam L, substantially as and for the purpose described.

65,977.—WILLIAM N. WHITELEY, JEROME FASSLER, and O. S. KELLY, Springfield, Ohio.—*Manufacture of Harvester Guard Fingers.*—June 18, 1867.—The blanks after milling, slotting, boring, and grinding, are placed in cast-iron boxes with pounded charcoal, the box luted with clay and submitted to heat in a furnace for twelve hours. This converts the surface into steel which may be hardened and polished.

Claim.—First, guard fingers for harvesting machines, made by the process and order of manufacture herein described.

Second, a harvester guard finger composed of a central portion or core of soft iron and its entire outer skin or surface of hardened steel, substantially as and for the purpose set forth.

65,978.—C. H. and J. M. WILDER, New York, N. Y.—*Nipple Shield.*—June 18, 1867.—The interior adjustable sliding screen limits the elongation of the nipple when suction is applied.

Claim.—First, the arrangement of a screen a in combination with the nipple shield A, substantially as and for the purpose described.

Second, the adjustable slide C, in combination with the screen a and nipple shield A, substantially as and for the purpose described.

65,979.—HOSEA WILLARD, Vergennes, Vt.—*Clothes Dryer.*—June 18, 1867.—Each bar has a staple, which is looped upon it, and its end rests, when in a horizontal position, beneath the semicircular plate.

Claim.—The securing of the clothes bars B in the stirrups c of the bracket by means of oblong staples d , or their equivalents, to admit of the longitudinal adjustment of the bars in the stirrups, substantially as and for the purpose specified.

65,980.—ALVAH WISWALL, New York, N. Y.—*Spring Hinge.*—June 18, 1867.—The upper edge of the movable leaf has a projecting arm with a friction roller, and the lower end of the fixed leaf has a projection supporting a pin on which a spring is closed; the latter oscillates an arm bearing on the roller of the other leaf, and thus closes the door unless it be vibrated beyond a certain point, when the tendency is to keep it open.

Claim.—The spring D combined with the bar E, arm C, provided with a friction roller a , and the hinge, all arranged to operate in the manner substantially as shown and described.

65,981.—A. B. WOOD, Hamburg, Arkansas, assignor to himself, W. W. WOOD, and W. H. WOOD,

same place.—**Mechanical Power.**—June 18, 1867.—Between the wheels, which are revolved by the prime motor, and the ultimate machine or object to be driven gearing is applied to increase the power.

Claim.—The interposition of intermediate mechanical parts or gearing between the point of direct application of power and the point at which an increase of power is attained and applied for the purpose of increasing the capacity of power of any given motor, engine, or machine, when the same is effected substantially in the manner and by the means herein described.

65,982.—EDWARD J. WORCESTER, Worcester, Mass., assignor to himself and WILLIAM S. PORTER, same place.—*Brush.*—June 18, 1867.—Either end of the brush back is slipped into the socket of the handle and secured by a screw.

Claim.—First, the combination of handle G and back B with a removable metal connection piece or socket, such as described, which can be readily applied to either end of the back of the brush without injuring or defacing the same, for the purposes stated.

Second, the combination of the back B and handle C with the bent metal socket or connection piece E and flanges a a, substantially as and for the purposes set forth.

65,983.—GEORGE S. ZIEGENFUSS, Doylestown, Pa.—*Wagon Brake.*—June 18, 1867.—The brake may be operated from the top of the load, the side of the box, or the rear of the wagon. The brake bar is attached to pivoted levers, which are operated by cord or levers from the various positions named.

Claim.—First, the brace F, in combination with the lock bar E and bolts f, or their respective equivalents, substantially as described.

Second, the pole H carrying the lever K and rack h, in combination with the cord K, pulleys L l, and lock bar E, or their respective equivalents, substantially as described.

Third, the combination of two or more independent brakes applied to a wagon or other vehicle, adjusted so as to be brought into play either separately or together, substantially as described.

65,984.—GEORGE W. WOOD, Richmond, Ind.—*Inking Apparatus for Printing Presses.*—June 18, 1867.—A series of adjustable sector plates are arranged in sets on a common shaft, each set being employed to transfer one color from the fountain to the roller.

Claim.—First, sector plates E E¹ E², adjustably arranged in sets for transferring the ink from the fountains and disposing the colors or bands upon the type rollers.

Second, the combination upon one shaft of the sector plates and cam wheels C C'.

Third, the combination of the ink fountain rollers, a corresponding number of sector plates, and a type-inking or other receiving roller or rollers.

65,985.—CHARLES V. WOERD, Waltham, Mass., assignor to AMERICAN WATCH COMPANY.—*Winding Watches.*—June 18, 1867.—The key is screwed into a nut restricted to a longitudinal movement in the pendant and acts as a push pin to depress the case-spring; the key is removed to use it for winding in the usual manner.

Claim.—A key having a screw formed upon its shank to work into a screw thread formed in the watch pendant, or in a nut inserted in the pendant, substantially as shown and described.

Also, forming a key to be directly connected with and disconnected from the pendants, with its means of attachment integral with or projecting from the shank, substantially as shown and described.

Also, the combination of the nut b and key B, arranged substantially as set forth.

Also, making the block or nut, through which the key extends, movable vertically, as and for the purpose substantially as described.

65,986.—ABRAHAM TRAGER, New York, N. Y.—*Hoop Skirt.*—June 18, 1867.—Explained by the claim.

Claim.—The use of ribbed or corrugated wires for hoop skirts, either with or without any kind of coating or covering, as herein described.

65,987.—WM. C. ALLISON, Philadelphia, Pa.—*Apparatus for Forming Bumper Carriers for Railroad Cars.*—June 25, 1867; antedated June 10, 1867.—For bending flat bars of iron to a form suitable for use as bumper carriers for railroad cars. On the table are arranged: first, a square former made in two parts, so as to expand laterally; second, a grasping block which, in conjunction with the former, holds the bar in position by its middle portion; third, two square blocks pivoted to the table in such manner that, when turned round on their pivots, they will bend the bar down against two sides of the former, at right angles to the portion grasped; fourth, two other blocks similarly pivoted, which, when turned around, will bend the two ends of the bar outward against the side of the two blocks just previously turned, at right angles to the portion previously bent.

Claim.—First, the combination of the block H, handled eccentric l, blocks B and C, and the devices herein described, or the equivalents to the same, for effecting the simultaneous action of the blocks, in the manner described.

Second, the combination, substantially as described, of the bending blocks E and E' and F and F' with the blocks B and C.

Third, the combination of the forming blocks E and E' with the handled eccentrics t and t'.

Fourth, the arrangement on each of the several forming blocks of its spindle and collar in respect to the corner of the block, as described.

65,988.—BEN. D. ATWELL and Miss G. H. CRAWFORD, Portage City, Wis.—*Keeping Eggs.*—June 25, 1867.—A solution of two ounces of white glue and one ounce isinglass is added to a solution of one ounce unslaked lime and two table-spoonfuls of corn starch. Boil the mixture and dip the eggs therein while hot.

Claim.—The application of the above recipe for preserving eggs, as herein described, using for that purpose the aforesaid ingredients, or any other, substantially the same, and which will produce the intended effect.

65,989.—ALVA S. BAILEY, Knoxville, Ill.—*Bolt Cutter.*—June 25, 1867.—The stationary cutting lip is at the end of the recess in the head, and the other lip is moved thereto by the action of two cams pivoted to the head. A spring retracts the movable cutter.

Claim.—The combination of the head A, provided with the stationary cutter a, sliding cutter c, provided with the head d, spring m, and the pivoted handles B C, having the cams n formed thereon, when all are arranged for joint operation as herein shown and described.

65,990.—RALPH P. BAILEY, Niagara Falls, N. Y.—*Machine for Dressing Marble.*—June 25, 1867.—The clamp arms are pivoted in the head and allowed sufficient oscillation to bring them into position for cutting when rotating in either direction. The clamps have an inside bevel at the outer end, to allow a slight bend in the cutters, to prevent breaking of the same.

Claim.—The employment of a series of spring blades or scrapers h, in combination with the clamping arms C and head or stock A, for acting successively on the material to abrade it to the form of said blades, when constructed, arranged, and operating substantially as and for the purpose set forth.

Also, the arm or holder C, when connected with the head A, or its equivalent, by means of pivot d and the bearing bolts e e, arranged to allow the blades to adjust themselves to the work when rotated in either direction, substantially as set forth.

Also, in combination with the blade k and its set bolt k, the chamfering away of the clamp sides at i i, substantially in the manner and for the purpose set forth.

65,991.—N. BARNUM and G. C. SCRIBER, St. Louis, Mo., assignors to N. BARNUM, same place.—*Drilling Instrument.*—June 25, 1867.—The tool is set in its stock with an eccentricity adjustable by a set screw so that the diameter of the path described may be readily regulated.

Claim.—First, the stock B, with a tool cavity and tapering slots for the screw e², in its lower end combined with the spring C, and set screw e², substantially as described and set forth.

Second, the slotted tool *c*, in combination with the spring holder *C*, and its set screw *c'*, and tool stock *B*, when acting substantially as set forth.

65,992.—JAMES AMIRAUX BAZEN, Canton, Mass.—*Rotary Pump.*—June 25, 1867.—The wings of each piston abut upon an elastic packing surface in the counterpart recesses of the opposite piston.

Claim.—The packing *f k*, constructed as described, and arranged between the wings of the piston, substantially as set forth.

65,993.—ALBERT BINGHAM, Newtonville, Mass.—*Blind Fastener.*—June 25, 1867.—The catch bar is pivoted below the edge of the shutter and engages a stop on the sill or wall. The bar is guided by a pin depending from the sash, which also supports the bar when swinging.

Claim.—The blind fastener as composed of the catch lever *C*, the stop *D*, its shoulders *h h*, and the catch *E*, arranged and constructed so as to be applied to a blind and a window frame or sill, substantially as specified.

65,994.—E. BLAKESLEE, Plymouth, Conn., and J. S. HUNTER, Hartford, Conn.—*Water Meter.*—June 25, 1867.—The valve seat has three openings. The middle one inducts water to the chambers alternately, the outer ones educt water alternately from the respective chambers. A diaphragm divides the chamber and is driven to one or the other side alternately by the pressure of water moving the rod and the weighted lever which actuates the valve.

Claim.—First, the valve *I*, having the opening *a*, and passages *d* and *e*, arranged in relation to the ports in the valve seat so as to operate substantially in the manner described.

Second, in combination with the above, the weighted lever *k*, constructed so as by its movement to reverse the flow of water, substantially as herein set forth.

Third, in combination with the above, the diaphragm or piston, arranged substantially in the manner described.

65,995.—VALENTINE BORST, New York, N. Y.—*Harness Saddle.*—June 25, 1867.—The shanks of the hooks slip into the hollow bridge piece and are held by the prolongations of the screws of the terrets.

Claim.—The removable hooks *C C*, adapted and arranged to and with the hollow bridge or pier *B*, substantially as set forth, so that the saddle can be used with or without the hooks.

Second, the use of the terrets *D D*, for securing the hooks *C C*, in the ends of the hollow bridge of the saddle, substantially as set forth.

65,996.—SAMUEL C. BROWN, Richmond, Ind., assignor to J. A. FAY & Co., Cincinnati, Ohio.—*Mortising Machine.*—June 25, 1867.—The mandrel has its bearings in a plate adjustable in a vertical plane so as to adjust the obliquity of the saw to give the required inclination to the mortises in the blind stile which is laid on the carriage and fed up to the saw for each cut.

Claim.—The cutter *f*, shaft *p*, and pulley *m*, attached to the flanged plate *n*, when said plate is made adjustable upon the bed plate *r*, substantially in the manner and for the purpose set forth.

65,997.—JOHN DAVID BROWNE, Cincinnati, Ohio.—*Hand Loom.*—June 25, 1867.—By turning the crank handle the rod attached thereto operates the batten and also the treadle shaft. A pin on the centre of the rod is connected with a slide which runs in the slotted plate; the open yoke on the batten plate allows the necessary play of the same upon the pin.

Claim.—The cranks *a b*, and the rod or bar *D*, having a centre pin *e*, and the guide plate *G*, in combination with the shaft *C*, substantially as herein described.

65,998.—CHAUNCEY BUCKLEY, Meriden, Conn., assignor to CHARLES PARKER, same place.—*Machine for Forming Spectacle Frames.*—June 25, 1867.—The clamping devices on the holding plate retain the frame in place while a plunger passes through the eye and into an opening in the bed, bringing the eye to the form required to contain the lens.

Claim.—The eye former or stretcher consisting of

a plunger to enter the eye and a bed for the eye to rest upon, having an opening through it of the form of the eye desired for the plunger to pass into in combination with the holding pieces *d' d'* as set forth.

The combination of the adjustable supporting plates *c*, the bed and the plunger, substantially as described.

65,999.—A. M. BURKE and S. WRIGHT, Cleveland, Ohio.—*Treating Hydrocarbon Oils.*—June 25, 1867.—To 30 barrels of oil are added nine gallons of caustic soda, at 20° Beaumé, and one quart of aqua ammonia. The distillate of the mixture is agitated with the addition of 94 pounds of sulphuric acid to the barrel in connection with a current of air. Agitation in water removes the acid.

Claim.—The herein-described process of consecutively treating oils, first by alkali in the still, as specified, and subsequently by the use of acids in the agitator as a continuation of the said process, substantially as set forth.

Second, as a means for carrying out the herein-described process we claim the valve or plug *D*, provided with suitable devices for operating the same in combination with the pipe *C* and still, substantially as described.

66,000.—MARTIN BURTON, Indianapolis, Ind.—*Steam Water Elevator.*—June 25, 1867.—Steam being introduced into and condensed in the chamber, the water enters by the induction pipe; the float is then depressed by steam, expelling the water at the discharge pipe, whose valve prevents its return. Boiler communication being cut off and communication being established between the cylinders the steam is condensed, water flows in, the float rises, and the operation is repeated.

Claim.—First, the arrangement of the chambers *A* and *B*, and pipes *G H* and *C*, in the manner and for the purpose substantially as set forth.

Second, the arrangement of the steam induction pipe *F*, water induction pipe *D*, eduction pipe *L*, and valves *E M* and *N*, float *I*, rod *J*, and lever *K*, substantially as and for the purpose set forth.

66,001.—S. G. CABELL, Quincy, Ill.—*Electro-Magnet.*—June 25, 1867.—The central core is surrounded by and connected to two concentric tubes. The two annular spaces within the tubes contain a helical coil of insulated wire which passes down one space and up the other. The ends of the helix are connected to the opposite poles of the battery.

Claim.—A compound magnet consisting of two or more helices inclosed in soft iron tubes, with the tubes so arranged as to separate the helices, and both tubes and helices arranged concentrically around a central tube or bar, as herein described.

66,002.—H. W. CAMP and A. W. FOX, Owego, N. Y.—*Corn Planter.*—June 25, 1867.—The seeding device is stopped and the drill teeth are raised by pressure of the foot on a lever; by pushing a hand lever the seeder is set to work, and the index makes a mark opposite the hill planted, to form a guide when planting in check rows.

Claim.—First, the index *B*, when constructed, arranged, and applied to machines planting in rows, for the purpose and as herein specified.

Second, the wheel *E*, provided with a zigzag rim surrounding its periphery in combination with the feeding bar *F*, when constructed and operating substantially as herein described.

Third, the shields *h*, and gauges *m*, in combination with the feeding bar *F*, the whole constructed and operating substantially as herein specified.

Fourth, the shoes *K*, for removing obstructions and regulating the depth the seed is to be planted, in combination with the hollow teeth *p*, and roller *P*, when constructed in the manner herein set forth.

Fifth, the ratchet teeth with pawl *d*, and cone *e*, in combination with the driving wheel *A*, index *B*, and wheel *E*, when these several parts are arranged and operating substantially as herein specified.

66,003.—C. M. CLINTON and L. WOOD, Ithaca, N. Y.—*Calendar Clock.*—June 25, 1867.—Cannot be briefly described other than substantially in the words of the claim.

Claim.—First, the twenty-four-hour escape made

by the segmentary wheel A, segment B, and arm C, when substantially made as described.

Second, in combination with the arm C, the use of the eye D, or its equivalent, acting in a variable and changeable space, between the nuts or burs E and F, or their equivalent, both for the purpose of holding and adapting our various devices to each other and to allow a constant movement of our time escape-arm C, while the rod G moves different or diverse distances according to the variable length of the months of the year, and also for adjusting the calendar and clock works to each other, as set forth.

Third, the springs I and H, acting on the correcting rod G, and the segment B, either one or both, for preventing contingent or unintentional changes or displacements, and yet allowing the changes to be made by the mechanism of the clock and calendar at their appropriate times, as described.

Fourth, the combination of the spring I with the rod G, as described, for the purposes of retracting the said rod or rods and its connecting parts and operating the calendar correctly through our other devices be the position of the clock and calendar what it may; and also for the purpose of obtaining a complete or supplementary driving power for our calendar, as described.

Fifth, gearing the month cylinder into the month wheel either directly or by intermediate cog wheels, as described.

Sixth, the vibratory shaft and cog wheel, or any similar device, and the gearing the same in any manner with the thirty-one-day wheel or days of the month device, when so made as to revolve the days of the week cylinder one or more days' space, as described.

Seventh, putting or making the cam for throwing out of gear the vibratory shaft and its cog wheel on the weight lever or cross bar of the thirty-one-days wheel, and the detent Y b, for holding the said cog wheel and its connected parts fast while out of gear; and the gearing of the day of the week cylinder into the vibratory device; the whole of these just named parts as a combined whole or each acting separately by itself, as described.

Eighth, the fixed stop N, for checking the upward motion of the weight lever or cross bar by the pawl or dog M, or other convenient part connected with the said lever or bar, as described.

Ninth, making registers or cylinders of calendar clocks either wholly or in part of paper, or other similar light material, for the sake of their lesser weight and strain on the mechanism of the calendar, as described.

Tenth, the specific device of a month wheel made by the variable depth of teeth Ua Ub Uc and Ud to accomplish every possible monthly change reasonably requisite in a calendar clock, as figured and described.

Eleventh, the device of putting the month wheel in direct communication with the thirty-one-day wheel shaft or any part or portion of the thirty-one-days wheel or shaft, as described.

Twelfth, placing the month escape cam on the shaft of the thirty-one-days wheel so that one tooth or month of the month wheel escapes in every revolution of the thirty-one-days wheel.

Thirteenth, a wheel cam or escape so made and operated as to act as a stop or detent to the month wheel and yet allow at the proper time that wheel to revolve as described, and also the making of an additional length of teeth to the teeth of the month wheel so as to fit and embrace the said cam or escape, as described.

Fourteenth, the hinged lever, substantially made as described, and operating so as to produce the described results on the month wheel and escape detent of the thirty-one-days wheel on either one or both of the said parts, as described.

Fifteenth, the employment or use of a hinged lever on the shaft of the thirty-one-days wheel when accomplishing any one or all of the purposes described.

Sixteenth, the shoe-shaped and convex cams, one or both, on the end T of the hinged lever, as described.

Seventeenth, centering and connecting the devices of the hinged lever K, the cam or escape Va, of the month wheel, the month wheel U, the vibratory arm and cog wheel Y, and through the said month wheel and said cog wheel, the month and the day of the week cylinders, immediately with the axis V, of the thirty-one-days wheel or that wheel itself, as described, thus simplifying and making more compact the calendar.

66,004.—CHARLES DEAVS, New York, N. Y.—*Gas Apparatus*.—June 25, 1867.—The gas passes from the twin retorts through a water-cooled pipe to the wash box, where it is disseminated in small globules by passing through the meshes of a concavo-convex perforated disk. It thence passes to a gas-holder which operates a cut-off valve to limit the supply of oil and the evolution of gas.

Claim.—First, the use of two or more retorts connected together in pairs so that the first shall volatilize the oil or oily substance, and the second shall complete the conversion thereof into a fixed gas suitable for illuminating purposes, the said retorts being constructed and arranged substantially as and for the purpose herein above set forth.

Second, the combination with the conductor pipe K of a cooling trough L, the water from which supplies the wash box, substantially as and for the purpose set forth.

Third, the combination with the discharge end of the conductor pipe K of a perforated or reticulated disk A, substantially as and for the purpose set forth.

Fourth, the combination with the oil reservoir U and retorts B B' of a cut-off v, constructed and operated substantially as herein described.

66,005.—ROSCOE G. DENNETT, Saco, Me., and LIBERTY B. DENNETT, Portland, Me.—*Window Screen*.—June 25, 1867.—The screen is wound by springs on a roller contained in a case, and is attached by eyes to studs on the sash so as to unwind when the sash is raised, and re-wind when the sash closes.

Claim.—The combination of the cylinder g, spring v, and pins h h, or their equivalent i, cavity v, spring f, rotary cylinder k, cog m, groove n, pin w, and mortise y, when constructed and operating in the manner and for the purpose specified.

66,006.—WM. A. DEVON, Port Richmond, N. Y.—*Boat Detaching Apparatus*.—June 25, 1867; ante-dated June 11, 1867.—The mousing hooks at each end of the boat engage the links of the davit fall; the links are cast off by the simultaneous retraction of sleeves, which release one jaw of each hook.

Claim.—First, the construction and application of the jointed hooks attached to the boat by an extended shank in combination with the slides g and interposing springs, arranged and operating substantially as specified.

Second, the arrangement at opposite ends of the boat of detachable spring hooks, constructed substantially as described, in combination with rod, rope, or chain connections within the boat, whereby they may be operated in unison to unlock the slides that secure the hooks in their closed condition, essentially as herein set forth.

66,007.—J. P. EMSWILER, Knightstown, Ind.—*Animal Trap*.—June 25, 1866.—The bait is placed on a hook of the oscillating door. The rat approaches over the drop board, whose fall closes the side and upper doors, and the rotating rack throws the rat upon the inner trap, which admits the animal into the chamber beneath. This action resets the trap.

Claim.—First, in a rat trap, the combination of devices for disengaging the shaft C, and actuating the fingers K and doors D and F, substantially as described.

Second, a combination of the revolving fingers K, shaft C, eccentric C', rod E, and door F, substantially as described.

Third, the combination of the revolving fingers K, shaft C, eccentric C', rods D', and doors D, substantially as and for the purpose set forth.

Fourth, in combination with the revolving shaft C and fingers K, and automatically acting door F opening into the upper chamber; the door L opening into the lower chamber, substantially as and for the purpose set forth.

66,008.—JAMES W. EPPERSON, Woodhull, Ill.—*Farm Gate*.—June 25, 1867.—The gate is supported on rollers on the sides of two posts, and is moved by a spur-wheel upon a long shaft turned by a winch at either end.

Claim.—First, the spur wheel E, operating substantially as described.

Second, the grooved rail D' of the gate D, in com-

bination with the spur wheel E and the revolving wheels C attached to the fence posts and upon which the gate slides on opening and closing.

Third, in combination with the gate D, with horizontal rail D¹ and vertical strips D², the spur wheel E, shaft E¹, and winch F, arranged to operate substantially in the manner and for the purpose set forth.

66,009.—JOSEPH S. FARNSWORTH, Windsor, Vt., assignor to EBENEZER G. LAMSON, President of the Windsor Manufacturing Company.—*Dies for Swaging and Punching the Jaws of Wrenches.*—June 25, 1867.—Three pairs of dies are used; the first swages the metal to the general form of the wrench jaw, the others are like it, except that the movable section of each carries a punch for forming the eye, which is done not by entirely removing the metal from the blank, but by turning the portion punched out, around at right angles to the jaw.

Claim.—The combination of dies and punch, constructed and operating substantially as described.

66,010.—M. R. FENTON, Washington, D. C.—*Curtain Fixture.*—June 25, 1867.—In addition to the devices for raising and lowering the window shade the upper portion may be oscillated, making an upper opening for light.

Claim.—First, the hinges A A in combination with bar C and roller D, substantially as and for the purpose specified.

Second, hinges A A, pulley J, cords s and n, and roller D, combined and operating in the manner and for the purpose substantially as herein described.

66,011.—L. B. FLANDERS, Philadelphia, Pa.—*Apparatus for Boring Cylinders.*—June 25, 1867.—As the boring bar revolves and the casing remains stationary the train of wheels causes the boring bar to move longitudinally on the stationary screw. To move the boring and cutting head quickly to any point in the cylinder the gearing is shifted. For facing the ends the feed is thrown out of gear and the bar held stationary by tightening the split ring.

Claim.—First, the combination of the boring bar B, the casing I, its train of wheels herein described, or the equivalent to the same, the nut w, and the stationary feeding screw G, the whole being arranged and operating substantially as described.

Second, the cog wheel g, its circular recess and grooves t t, in combination with the hollow spindle r, and the rod s with its pin s¹, and spiral spring u, the whole being arranged and operating substantially in the manner and for the purpose set forth.

Third, the bearing E, in combination with the adjustable and conical split ring g, and ring g¹, or its equivalent, the whole being constructed and arranged substantially as described.

Fourth, the split ring b in combination with the bearing E, as and for the purpose described.

66,012.—PETER H. FLANSBURGH, Eden township, Cal.—*Side Hill Plow.*—June 25, 1867.—The plows are placed side by side, and operate independently of each other, being adjusted by means of racks and segmental pinions.

Claim.—First, the two plows C C¹, placed side by side and operating independent of each other, either by a hinge or rack and pinion, substantially as herein described.

Second, the levers H and H¹ with the toothed segments G and G¹, operating the plows by means of the independent vertical racks E E¹, substantially as and for the purpose described.

66,013.—JIM B. FULLER, Norwich, Conn., assignor to himself and J. P. UPHAM, Claremont, N. H., and EDWIN T. RICE, New York.—*Bleaching.*—June 25, 1867; antedated June 11, 1867.—Elastic rollers draw the linen through the bleaching liquor and feed it back again into the tub.

Claim.—First, the method herein specified of subjecting the fabric or fibers to the operation of elastic squeezing rollers, to produce a circulation of the bleaching liquid throughout the fibers of the fabric, substantially as set forth.

Second, the method of utilizing the chlorine gas contained in the fabric or fiber after it has been squeezed by elastic rollers by immersing the same in water, as set forth.

66,014.—MITCHELL C. GARDNER, Rochester, N. Y.—*Chuck for Planing Iron.*—June 25, 1867.—The chucks are held by bolts whose heads enter the ordinary grooves of the table and pins entering holes in the same. The blocks are adjustable by screws.

Claim.—The sliding jaws B B, and the bracket or support D, back of one of the jaws B B, to chuck lengthwise the table, and at the same time using the jaws BB for chucking both crosswise and lengthwise the whole table, in combination, substantially as specified and for the purposes set forth.

66,015.—J. C. GASTON, Cincinnati, Ohio.—*Churn.*—June 25, 1867.—The chamber below the lid has several openings which confine the air to a circuitous course and prevent the splashing out of cream.

Claim.—The guard chamber C, having one or more openings c in its side wall b, substantially as shown and described.

66,016.—LEWIS GIBBS, Canton, Ohio, assignor to BUCHER, GIBBS & Co., same place.—*Plow.*—June 25, 1867.—The bar on the lower edge of the landside is united to the share by a dovetail underneath. The clevis is cast in two portions, which clasp the beam by a dovetail socket and are secured by a bolt.

Claim.—Uniting the bar A to the share B, at the point a, underneath the share, as and for the purpose herein described.

Also, a clevis made in two parts, with dovetailed recesses cast therein, so as to fit a dovetail or shoulder formed on the end of the beam and united thereto by a bolt or key, substantially as herein described and represented.

66,017.—ALBERT H. GILMAN, Hopedale, Mass.—*Spindle for Spinning.*—June 25, 1867.—The spindle step has an upwardly projecting annular flange, having a cap which rests on a collar of the spindle and whose edge loosely embraces the upper edge of the flange. A stud on the flange enters an opening of the collar to insure its rotation with the spindle.

Claim.—The application of the step cap C to the spindle A, by means or devices, such as when the cap may be encompassing or covering the step, and the spindle may be in revolution, shall not only cause the cap to be revolved with the spindle, but allow it, the said cap, to be freely raised off the step in order to enable such step to be supplied with oil as occasion may require.

Also, the combination and arrangement of the collar D, with the spindle A, and the cap arranged with a step as set forth, the collar being for the purpose or object as explained.

Also, the arrangement of the collar D, and the stud d, with the spindle A, and the cap C, provided with a recess or hole c to receive the stud, and applied to a step B, substantially as described.

66,018.—CARLOS H. GOULD, Cincinnati, Ohio.—*Boiler Feed Water Regulator.*—June 25, 1867.—The float is enclosed in a perforated, open-topped box and is connected by a bent rod to a radial spindle turning in a sleeve screwed into the side of the generator. From the outer end of the spindle projects a lever which is adjustably connected to the stem of the feed water valve; this consists of a diaphragm covering the mouth of the inlet water pipe, upon which the valve stem rests, with force adjusted by the weight upon the lever.

Claim.—First, the reciprocating rotary shaft C, traversing the boiler side within a suitable horizontal sleeve A, and provided with a float F, inside of the boiler, and adjustably weighted lever I, outside of the boiler, in combination with the adjustable rod K, and valve guarded water supply pipe, substantially as set forth.

Second, the arrangement of the rod K, bossed cap P, diaphragm N, and water supply pipe Q, for the purpose described.

Third, the oblong float F, stem E, reciprocating rotary shaft C, sleeve A, with steam tight joint or joints in combination with the rod K, and diaphragm stop N.

66,019.—WILLIAM HANSON, Willoughby, Ohio.—*Sorghum Evaporator.*—June 25, 1867.—A sectional defecating and heating tank is placed over a heating furnace and communicates by hose, having stop-cocks,

with the evaporating pan. The dampers may be interposed between the fire-box and pan. The frame allows the scum to rise through the apertures and to collect on the flat upper sides.

Claim.—First, the employment of the partitioned tank M, provided with stop-cocks and hose P and P', in combination with the evaporating vat K, auxiliary fire-box I, dampers X X, constructed with turned up edges Y Y Y', arranged and operating as and for the purpose specified.

Second, the framed bars C, constructed as described, and connected together in sections by free joints II, and provided with levers T and T', in combination with the evaporating vat K, provided with ledges L, operating as and for the purpose set forth.

Third, constructing the body of the evaporator with a main fire-box E, at its front end, a wide and gradually contracted fire-chamber II, and auxiliary fire-box I, arranged and operating as specified.

Fourth, providing the main fire-box E with elongated draft openings F F F through the bottoms thereof, and with brick lined intermediate spaces between said openings, so as to operate as and for the purpose herein stated.

Fifth, the use of extended lever arms U U', located as shown in figure 1, and operating the drain gates V V, in the manner specified in combination with the evaporating vat K, as set forth.

66,020.—DAVID HARDING, Lowell, Mass.—*Machine for Beating and Picking Cotton.*—June 25, 1867.

—The cotton waste on the feed apron is carried forward to the two toothed rollers between which it passes to the main cylinder by which it is carried down past the lower claw roller.

Claim.—The cylinders O N R, armed with teeth as described, in combination with the main cylinder C, the several parts being constructed and arranged as and for the purpose set forth.

66,021.—WILLIAM EDWIN HEATH, Pembroke Terrace, England, assignor to JOSEPH WEATHERY BARTLETT, New York, N. Y.—*Torch for Lighting Gas.*—June 25, 1867.—The lamp is surrounded by a double perforated case; the non-coincidence of the holes in the casings prevents entrance of wind, while allowing sufficient passage to the air. The top is recessed to engage the projections of the bell-crank lever by which the cock is operated.

Claim.—First, the construction of the double case or cover having the perforated tubes A and B, arranged one within the other, for the purpose and substantially in the manner set forth.

Second, the double handle G, adapted either for burners constructed as shown in figure 3, or for ordinary gas burners, for the purpose and substantially in the manner set forth.

Third, the apparatus consisting of the tubes A and B, cap D, lamp C, and socket F, constructed and combined for the purpose and substantially in the manner set forth.

66,022.—WILLIAM HENDERSON and J. GREENAWALT, Pittsburg, Pa.—*Abdominal Supporter.*—June 25, 1867.—Explained by the claim and illustration.

Claim.—Securing the end of the wire L, by means of a spring catch b, attached to the front plate A, and operated by the knob K, in the manner herein shown and set forth.

66,023.—CONRAD HERMAN, Baltimore, Md.—*Device for Closing Bottles.*—June 25, 1867.—The clamping rind passes around the neck. The cap is hinged thereto and has a rubber cushion to pack the opening.

Claim.—The hinged clasp A, fastened by means of the lugs a and screw b, and having the upright arms d d' with the cover B pivoted to d' and fastened to d by means of the lugs o n and screw t, when arranged to operate substantially as described and set forth.

66,024.—CHARLES HINKLEY, Williamsville, N. Y.—*Lime Kiln.*—June 25, 1867.—The cupola is elliptical in horizontal section and the furnaces in the line of its smaller diameter. The furnaces flare laterally inwards and have deflecting pillars at their intersection with the interior of the cupola. Air is supplied to the caloric current above the said intersection.

Claim.—The combination arrangement of the elliptic cupola A, the inwardly widened furnaces B B, sharp-edged pillars h h and flues e e, as and for the purpose herein specified.

66,025.—D. L. HOLDEN, New Orleans, La.—*Petroleum Gas Burner for Heating Purposes.*—June 25, 1867.—Explained by the claim and illustration.

Claim.—A gas rotort and burner, consisting of the concentric or annular oil chamber C, in combination with a central air chamber or flue B, provided with perforations D', at or near the top of chamber C, substantially as and for the purpose described.

66,026.—HENRY HALL, Pattersonville, La.—*Machine for Cleaning Moss.*—June 25, 1867.—The moss is placed on a feed board at one end of the cards and is drawn through between the cards by the inclination of the teeth on the bed and on the oscillating carder.

Claim.—The vibrating convex card A, in combination with a fixed concavo card C, when the teeth of both project in the same direction and at the same angle as described for the purpose set forth.

66,027.—MARSHALL INGERSOLL, Elyria, Ohio.—*Field Fence.*—June 25, 1867.—The bars pass through anchored iron posts and are secured therein by keys. A network of wire may be stretched between either of the two bars.

Claim.—The fence constructed and arranged in the manner and for the purpose substantially as specified.

66,028.—ISAAC JUDSON, New Haven, Conn.—*Hydraulic Pressure Regulator.*—June 25, 1867.—The valve stem is attached to two elastic diaphragms having different areas of bearing surface. The full pressure of the water is on the smaller one and the pressure on the larger one is graduated by the area of valve opening. The tendency is to promote an equality in the rate of passage as an increase of speed and pressure raises the valve to limit the area of opening and conversely. The valve may be kept open by a set screw.

Claim.—First, the combination of the two diaphragms with the valve and its stem, when they are constructed, arranged, and fitted for use substantially as herein described and set forth.

Second, the combination of a ring or annular disk with either of the diaphragms when used to lessen the extent of the yielding surface of the diaphragm, substantially as herein described and set forth.

66,029.—GEORGE W. KINTZ, West Henrietta, N. Y.—*Potato Digger.*—June 25, 1867.—A vine-pulling fork is in the advance, is pivoted to the beam and worked by a hand rod. The share raises the hills which divide to the right and left and pass over the slotted wings of the mold-board to the rakes, which comminute the mass before it falls on the shaker, which travels on rollers and is hitched to the plow. The tubers fall from the rear of the shaker.

Claim.—First, the double-winged mold-board plow, provided with the adjusting slats b and flaps a, arranged and operating in the manner and for the purpose set forth.

Second, the combination and arrangement of the adjustable combs D with the double-winged slatted mold-board C operating in the manner and for the purpose specified.

Third, the employment, in combination with the double-winged slatted mold-board of the rollers e e, situated in the ends of the handles as set forth.

Fourth, the combination with the double-winged slatted mold-board of the shaker, composed of the plates I, vibrating arms o, and axle G, with cogs n and the adjusting braces L, as set forth.

Fifth, the employment of the pivoted vine puller P with the ratchet rod Q, so arranged as to operate from the rear for discharging the vines as herein set forth.

Sixth, the arrangement of the machine as a whole, consisting of the slatted mold-board C, combs D, shaker I G L n o o, and vine puller P Q, as herein set forth.

66,030.—D. J. KIRKMAN and E. H. GRAY, Winchester, Ill.—*Adjustable Tire for Wheels.*—June 25,

1867.—The tire ends in two screw sockets and is adjusted in length by a right and left screw rod in combination therewith. The section of the rim left imperfect by this arrangement is filled out by an enveloping iron frame.

Claim.—First, the cap C, when constructed substantially as and for the purpose set forth.

Second, the shoe D, when constructed substantially as and for the purpose specified.

Third, the cap C and shoe D, as constructed in combination with bolt heads *ee* and screw bolt *d*, substantially as and for the purpose described.

66,031.—D. J. KIRKMAN and E. H. GRAY, Winchester, Ill.—*Plow.*—June 25, 1867.—The subsoil-plow standard slips in a staple on the plow standard, and is attached by links in the rear of the mold-board of the upper plow. It is vertically adjusted for depth of sub-furrow by engaging the tension link with either one of the series of holes in the standard bar.

Claim.—First, the employment of a subsoil plow F, when attached to the adjustable bar *m*, said bar being constructed and arranged in the manner herein specified.

Second, the adjustable bar *m*, double jointed arm *h*, and hook *i*, the whole combined in the manner and for the purpose set forth.

66,032.—AARON MARDEN and AARON H. BURGESS, Philadelphia, Pa.—*Nail Extractor.*—June 25, 1867.—The serrated jaws engage the nail head, and are drawn together by the pressure of the mortise ends in raising the lever.

Claim.—The jaws D D, when constructed with slightly tapering sides, hinged together at the top and having an intervening spring, which jaws rest in a corresponding tapering mortise B in the handle A, and operate together in the manner substantially as described and for the purpose specified.

66,033.—WM. M. MILLER, Tulpehoccan, Pa.—*Meat Cutter.*—June 25, 1867.—The block rotates by the engagement of its sprockets with the worm on the shaft. The cleavers are attached to spring arms, and the force of the blow is regulated by a nut on the pivoted block, in which their shanks are clamped.

Claim.—The block S and spring arms K, in combination with the screw nut Y, and in the manner and for the purpose specified.

66,034.—S. W. MOORE, Albion, N. Y.—*Beam Puller.*—June 25, 1867.—The teeth of the fixed bar engage the stalks, and the sliding bars come down in contact therewith to clamp them firmly. The stalks are freed at the rear of the cylinder and fall into a chute. The roller may be adjustable vertically by a crank and treadle, being sustained by a ratchet wheel and pawl, which is freed by the treadle.

Claim.—First, the combination of the fixed and sliding bars *b f*, armed with intermatching teeth *g' g'*, operating substantially as and for the purpose herein set forth.

Second, hinging or jointing the teeth *g'* in the manner and for the purpose specified.

Third, the employment of the guides or shields *i*, in combination with the sliding bars *f*, for the purpose set forth.

Fourth, the arrangement of the treadle P, rod Q, pawls *m*, and ratchet wheels *n n*, in combination with the disks or cranks M, connecting rod L, and arms H, operating to adjust and retain the roller, as herein set forth.

66,035.—DEWITT C. MOWREY, Milford, Mass.—*Boot Crimper.*—June 25, 1867.—Improvement on the patent of Josiah M. Reed, January 20, 1844. The clasp carries the two auxiliary jaws, whose upper projections enter slots in the cross-bar of the same, and are spread apart to hold the edges of the leather by the frustal block, drawn up between them by the crimping screw.

Claim.—The combination and arrangement of the auxiliary jaws with the clasp, the frustum, and straining screw.

Also, the application of the auxiliary jaws to the clasp by means substantially as described, viz: by the arms provided with ears and by slots, having the supports arranged as set forth.

66,036.—A. M. OLDS, New York, N. Y., assignor to J. W. HAWKURST.—*Mucilage Bottle.*—June 25, 1867; antedated June 12, 1867.—The brush is inverted in the bottle, and is withdrawn through a hole in the cap by a string which connects it with the lid; it retires as the lid closes.

Claim.—Constructing and arranging, in connection with a bottle, an upright adjustable brush operating through its cap, substantially as and for the purposes herein set forth.

66,037.—SAMUEL PAGE, McAllisterville, Pa.—*Evaporating Pan.*—June 25, 1867.—The boiling pan is over the furnace and the skimming pan behind it. The pivoted plate beneath the latter regulates the area of flue opening at that point. The finishing pan is at one side, and the heat is directed to it, or otherwise, by the arrangement of the dampers.

Claim.—First, the adjustable plate V, arranged as herein described, and employed to vary the size of the flue beneath the receiving or skimming pan, in the manner and for the purpose specified.

Second, the combination with the finishing pan G and chamber H of the dampers I J, arranged and operating in the manner and for the purpose set forth.

66,038.—ALONZO P. PAYSON, San Francisco, Cal.—*Gymnastic Swing.*—June 25, 1867.—The swing is suspended from bars, to which a reciprocation is given by hand levers, which bear against the bars and are pivoted to the beam above.

Claim.—A swing constructed with the supporting arms C C and the motive levers E F, substantially as and for the purpose described.

66,039.—JOHN C. PFEIL, Arenzville, Ill.—*Gang Plow.*—June 25, 1867.—The plow frame oscillates upon the spindles of the bent axle and is pivoted to the tongue. The adjustment of the angle formed by the frame and tongue regulates the depth of furrow, and is maintained by the lever and ratchet. The spindles are secured by arms and sleeves to the wooden axles.

Claim.—First, the lever *a*, having the cam *e* attached and arranged to operate in combination with the tongue C and beams B and B', as shown and described.

Second, constructing the crank axles E with a tubular portion to fit on the end of the wooden axle A, as shown and described.

66,040.—CHARLES E. PIERCE, New York, N. Y.—*Burglar Alarm.*—June 25, 1867.—The alarm mechanisms are placed around the bell and connected by separate wires to the special points to be guarded. The alarm which is sprung by an intruder brings an indicator into sight to show whence the alarm came.

Claim.—First, the lever *d*, with projection *f* and indicating plate attached, when arranged as and for the purpose set forth.

Second, the guards made up of the parts *n o* and *q q*, or their equivalents, operating as described.

Third, in combination with the guard as described, the slotted plate *m'* and knob *p*, for the purpose set forth.

Fourth, the forked lever *r*, in combination with the window guards, as described.

Fifth, in combination with the alarm movements the case or cover with openings, as described.

Sixth, the catch lever or keeper *b*, in combination with the center wheel *c* and the detent arm, as described.

Seventh, so arranging the guard bolt that by means of cords or wires connected therewith, an indicator plate is raised at the same time the alarm is given.

66,041.—ALONZO C. RAND, Union Mills, Pa.—*Making Illuminating Gas.*—June 25, 1867.—The air is first driven through a tank of crude petroleum and then through a tank of gasoline.

Claim.—The combination of the tanks A¹ and A² with the gas holder J, operated substantially as and for the purposes herein described.

66,042.—JAMES H. ROUNDEY, Oldtown, Maine, assignor to himself and AMOS H. ROUNDEY, same place.—*Churn.*—June 25, 1867.—The dasher rods are

pivoted to the lid and reciprocated by the oppositely projecting cranks on a winch shaft. The dashers are so pivoted to the rods as by their oscillation to throw the cream to the center of the churn.

Claim.—First, the double vibrating dashers *b b*, when constructed and arranged to operate in manner substantially as and for the purposes specified.

Second, the arrangement of churn *A*, the double vibrating dashers *b b*, and the vibrating levers *B B*, driven by crank *D*, or its equivalent, all arranged to operate in manner substantially as described and shown.

66,043.—*J. SCOTT RUSSELL, Rensselaerville, N. Y., assignor to W. N. ZIMMER and W. W. COGGSHALL, same place.*—*Rein Holder.*—June 25, 1867.—The reins are passed beneath the arms of the T-shaped tongues.

Claim.—The rein holder *A A*, having a T-shaped tongue, constructed substantially as herein set forth.

66,044.—*E. P. RUSSELL, Manlius, N. Y.*—*Automatic Apparatus for Lighting and Extinguishing Gas.*—June 25, 1867.—A supplemental jet of gas is drawn from the pipe a little below the main burner to secure ignition at the latter and consume the match or fuse, which moves horizontally and yields as it passes over the friction plate. The hands of the dial are set to the hours for turning on and off the gas to operate the tripping devices. The match after ignition opens the supplemental gas cock, which, after igniting the main burner, is closed by a spring. The release of the disk allows the coiled spring to turn the gas cock. The turning-off arrangements are substantially analogous.

Claim.—First, the supplemental gas cock *S*, attached to the main pipe *L*, when opened and closed by clockwork, substantially as described, for the purpose of lighting the main burner *M*.

Second, the jet *T* for burning off the match, substantially as and for the purposes set forth.

Third, the lever *U*, in combination with gas cock *S*, substantially as and for the purposes set forth.

Fourth, the wire *V*, substantially as and for the purposes set forth.

Fifth, the spring arms *O*, substantially as and for the purposes set forth.

Sixth, the revolving inclined friction plate *Q*, constructed and operating substantially as and for the purposes set forth.

Seventh, the springs *P*, in combination with the perforated arms *O*, for the purpose of holding the matches in the position described.

Eighth, the screws *F F'*, in combination with the bolts *J J'* and arms *H*, substantially as and for the purposes set forth.

Ninth, the combination and arrangement substantially as described, of the main spring *K*, gas cock *N*, and arms *H* and *O*, for the purposes set forth.

Tenth, the hands *D D'*, arranged and operating as described, in combination with step shaft *E*, hollow shaft of worm *F*, and thumb screw *L*.

Eleventh, operating the jet cock *S*, by means of the fuse itself, substantially as and for the purposes set forth.

Twelfth, placing the matches so as to revolve horizontally, substantially as and for the purposes set forth.

66,045.—*E. D. SANFORD, Baltimore, Md.*—*Clothes Dryer.*—June 25, 1867.—The frame is rotatable, and vertically adjustable, so that it can be filled from one standpoint on the ground and then elevated. The radial arms may be folded up to the axle post.

Claim.—First, the revolving rack, composed of the tubular sliding box *I*, collars *J J'*, rods *K*, supporting ropes *O*, and clothes lines *P*, or their equivalents, when constructed and operated substantially as and for the purpose described.

Second, in combination with the sliding rack of a clothes dryer, the weighted box *Q*, constructed and employed substantially as described, for the purpose specified.

Third, the arrangement of the rack *I J J' K O P*, post *A*, socket *B*, bed frame *C*, and braces *D*, with the rope *N*, loops *M*, weight *Q*, and pin or hook *L*, combined and operating substantially as and for the purpose set forth.

66,046.—*IRVING M. SCOTT and WILLIAM ROBERT ECKART, San Francisco, Cal.*—*Cut-off Valve.*—June 25, 1867.—The cut-off plates on the back of the slide-valve are operated by a rod having a right and left hand screw which traverse nuts on the backs of the respective plates. The screw receives motion from the governor to determine the point of cut-off in connection with the cut-off valve, which receives a constant motion on the back of the cut-off plates.

Claim.—First, the movable plates on partitions *n n'* arranged between and in contact with the main valve *c*, and cut-off valve *C*, substantially as described.

Second, the screw *J*, and spindle *h*, together with the wheels *k m o*, and the yoke *p*, arranged for disengaging the plates *n n'* from the action of the governor, substantially as described.

66,047.—*T. C. SEBRING, Rochester, N. Y., assignor to IRA A. HEBBARD, same place.*—*Harvester Pitman.*—June 25, 1867.—A key behind the plug which forms the rear bearing for the boxing, is forced up by a spring as the journal or its bearing becomes worn.

Claim.—The automatic take-up, constructed substantially as described, being composed of a spring *s*, and taper key *k*, plug *C*, and boxes *B* and *B'*, substantially as described.

66,048.—*BENJAMIN SHERWOOD and DANIEL FITZGERALD, New York, N. Y.*—*Toy Pistol.*—June 25, 1867.—The retraction of the trigger releases the spring lever whose end oscillates in the curved path and projects the ball through the bore of the pistol.

Claim.—First, the lever *D*, provided with a follower *C* on one end, and used in combination with the curved barrel and trigger *E*, as and for the purposes specified.

Second, the combination of the rubber set in the socket *F* with the curved barrel, and lever *D*, as and for the purpose specified.

Third, the curved barrel *A*, when used in combination with a follower which does not operate outside of the rear of the barrel, but which operates upon the ball or missile to be sent around the curve in the barrel, as and for the purpose specified.

Fourth, the form of the trigger *E*, adapted to be laid in between the two halves of the pistol, and not to need fastening.

66,049.—*S. W. SLOCUMB, Albany, Ill.*—*Wagon.*—June 25, 1867.—At the end of the axle is an eccentric circular bearing, which is secured in the hub of the wheel by an annular plate.

Claim.—First, the circular bearing *C*, in combination with the hub *D*, when constructed substantially as described.

Second, the combination of the circular bearing *C*, hub *D*, plate *E*, and ring *F*, substantially as described.

Third, the circular bearing *C*, when attached eccentrically to the axle and in front of a line passing through the center of the wheel, substantially as described.

Fourth, the arrangement of the holsters *H*, when placed in the rear of the axle, and the axle when placed in front of a line passing through the center of the wheels, substantially as described.

66,050.—*HARLOW C. SMITH, Chicago, Ill.*—*Grain Measure.*—June 25, 1867; antedated June 22, 1867.—The bag is attached by hooks to the measure and the hinged portion of the bottom unlatched to discharge the contents.

Claim.—A half bushel of similar grain measure, having its bottom composed of the stationary part *A* and the hinged portion *B*, and provided with the spring hooks *D*, or their equivalents, for attaching the bag, all constructed and arranged to operate as shown and described.

66,051.—*ISAAC H. SMITH, Albany, N. Y.*—*Wrench.*—June 25, 1867.—While the flat side of the adjusting screw is turned to the shank, the jaw is moved up to the object; the threaded side is then turned to the shank and the jaw tightened.

Claim.—The adjusting screw *E*, with flattened or concave side or sides *a' a'' a'''*, or their equivalents, for the purpose set forth, substantially as described.

66,052.—R. T. SMITH, Nashua, N. H.—*Universal Joint*.—June 25, 1867.—The stirrups which give bearing to the shafts of the smaller bevel wheels are pivoted on the axis of the larger wheel, so as to allow an oscillation of the stirrups on said axis.

Claim.—The combination of stirrups B and C, with their bearings *d d* and *e e* swinging on the intermediate shaft *g*, on which shaft an intermediate cog wheel or cog wheels, or pulley or two pulleys, may be placed, essentially as represented in the accompanying drawings.

66,053.—JOHN R. SPOONER, Lowell, Ohio.—*Button*.—June 25, 1867.—The button is attached to a plate which is bent around to clasp both sides of the cloth to which it is attached by spurs.

Claim.—The button fastening above described, composed of the bent plate A A', having the teeth *a a a* and the button B attached to it, substantially as and for the purpose described.

66,054.—DARIUS STEBBENS, Wallingford, Conn., assignor to himself and E. MORSE, same place.—*Lightning Rod Insulator*.—June 25, 1867.—The wire for attachment of the rod is secured to a button inside the insulator, or looped around a portion of it, so as to require no outside fastening to it.

Claim.—An insulator constructed substantially in the manner described, so that the rod may be secured directly from the interior of the insulator, as and for the purpose specified.

66,055.—ISAIAH W. SYLVESTER, New York, N. Y.—*Advertising Machine*.—June 25, 1867; antedated June 15, 1867.—The endless belt, having advertisements thereon, is carried on rollers within a frame. The rollers are rotated at variable speed by clock-work.

Claim.—First, the application to advertising of an endless curtain made to revolve automatically, at given intervals quickly, so as to attract attention by its motion, and then slowly, so as to be apparently motionless and to allow of the easy reading of the advertisements.

Second, the device whereby the power moving the curtain is retarded at regular intervals by means of the arm J, notching into, passing through, and being relieved from the periphery of the clock wheel, substantially as herein described and set forth.

66,056.—ELISHA H. TOBEY and COPLEY A. NOTT, Watertown, N. Y.—*Signals for Railroads*.—June 25, 1867.—The switch-rails connect by a bar with a vertical rod and gearing upon a frame, so as by the motion of the switch-rail to work a semaphore, which indicates the position of the switch, and also to rotate the frame in which the signal lamp is suspended, and expose another colored light in the required direction.

Claim.—First, the combination of the sliding signal box or other signal device with the mechanism for rotating the same in a horizontal plane, in such manner that the said device, when raised or elevated to a certain point in the signal frame, shall be thrown in gear with said mechanism, as and for the purpose herein described.

Second, the combination of the signal device, capable of sliding and rotary movement as described with the mechanism for imparting the rotary movement under the arrangement herein described, so that the position of the said signal device, when in gear with the said mechanism, shall be determined by the position of the switch with which the mechanism is connected, as and for the purpose set forth.

Third, the combination with the reflector box and its frame and actuating mechanism of a day signal actuated by said mechanism, in the manner and for the purposes set forth.

Fourth, the combination of the reflector box or signal device and its sliding frame with the guide rods upon which the said frame is mounted and held, substantially as and for the purposes set forth.

66,057.—ASA M. TOMB, Lyons, N. Y.—*Bed Bottom*.—June 25, 1867.—The "buckle" has hook recesses to receive the ends of a pin in the bight of a loop of rubber which is attached to the rail. Cross-bars of the buckle frame rest respectively against the

upper and lower sides of the slat, and the former bar has a pin entering a hole through the slat.

Claim.—First, the reversible buckle V, furnished with hook head at the end of each bar and with the hook *a*, for securing on either side of the rail as described.

Second, the hollow fastening to the bed rail or to a piece of wood attached to the bed rail, as shown at Fig. III, in combination with the reversible buckle and pin.

66,058.—JOHN WAGNER and JOHN SCHMID, Philadelphia, Pa.—*Fire Escape*.—June 25, 1867.—The platform on the "lazy tongs" lattice frames is raised by action of gearing upon the jointed rack which unwinds from the cylinders. The lattice is steadied by the contact of the ends of its lower bars with guide posts.

Claim.—First, in elevators and fire escapes, the lattice frames in combination with the jointed racks D D', the operating pinions E E', and the take-up cylinders F F', the same being arranged to operate together substantially as described, for the purpose of elevating and giving stiffness and steadiness to the lattice frames when in use.

Second, also in combination with the lattice frames A, of an elevator and fire escape, the friction wheels G, and the bearing posts H, arranged to operate together, substantially as described, for the purpose of giving additional stability to the lattice frames when elongated as described.

66,059.—W. P. WENTWORTH, Detroit, Mich.—*Door Lock*.—June 25, 1867.—A slot in the bolt contains the tumblers, which slide between posts placed on each side of the bolt when properly engaged by the key, but catch upon one or the other bolt when tampered with by an improper key.

Claim.—The slot B, in the bolt A, in combination with the enclosed tumblers or palls O, operating as set forth.

66,060.—CHARLES M. WHELDEN, Pittsfield, Mass.—*Soda and Mineral Water Stand*.—June 25, 1867.—The sirup bottles are enclosed in a transparent ice box, whose glass sides are connected at the corners by angle plates of metal.

Claim.—First, a soda and mineral water stand with one or more transparent sides, substantially as and for the purpose described.

Second, the double-flanged corner piece *c*, in combination with the transparent plates B, forming the sides of the stand A, substantially as and for the purpose set forth.

Third, the tubular packing pieces *d*, in combination with the transparent plates B and corner pieces *c* of the stand A, constructed and operating substantially as and for the purpose described.

66,061.—JERU F. WOTRING, Wiley, West Va.—*Car Coupling*.—June 25, 1867.—The pin is pivoted to the forward end of the hinged bar and is swung back by the entering link, its forward end and the forward end of the link entering the swinging guide to keep them in proper transverse position.

Claim.—First, the combination of the hinged bar B, hinged pin C, hinged guide D, substantially as and for the purpose described.

Second, in combination with the pivoted pin C, which is allowed to swing freely about a pivot *e*, the recessed guide block D, for guiding the pin C and link G, substantially as described.

Third, the construction of the block D with side jaws *g g* and a groove *g'*, substantially as and for the purpose described.

Fourth, the manner substantially as herein described of insuring the proper relation of the link to the pin and of coupling two cars together when such cars are moved towards each other, as set forth.

66,062.—E. H. ASHCROFT, Lynn, Mass.—*Fire-proof Safe*.—June 25, 1867.—Around the wooden lining is a coat of felt surrounded consecutively by a metallic lining, a filling of cement, a water chamber, a cement filling, and the exterior metallic casing. The generation of steam deadens the fire around the door joints.

Claim.—First, in a fire-proof safe, the combination

of a water space or chamber *d* with the pipes *i* leading therefrom and surrounding the door, constructed and operating in the manner shown and as set forth.

Second, in a fire-proof safe, a lining of felt *b*, or the equivalent thereof, for the purpose specified.

Third, in a fire-proof safe, the combination of a water chamber with a safety plug, or its equivalent, for the purposes set forth.

66,063.—E. H. ASHCROFT, Lynn, Mass.—*Gauge for Steam Generator.*—June 25, 1867.—Water and steam are let in below and above the glass tube by the rotation of the single rod, to which are attached the valves governing the lower and upper inlets.

Claim.—The combination of the valve rod *h* with the valves *i* and *j*, and with the inlets A and B, and glass tube C, constructed, arranged, and operating in the manner substantially as shown and described and for the purpose set forth.

66,064.—L. AUGUSTUS ASPINWALL, Albany, N. Y.—*Potato Digger.*—June 25, 1867.—The forks pass through the sides of the hill, gather the vines, and pass them under the roller, which aids the plow in raising the hill, which is delivered on to the shaking separator, which sifts out the soil; the vines and tubers are delivered in the rear.

Claim.—First, the construction of the separators, having three rows of fingers in their horizontal range.

Second, the direct connection of the separators with the cranks.

Third, the employment of the roller.

Fourth, the combination of the roller with the fork.

Fifth, the bent lever T.

66,065.—ARTHUR BARBARIN, New Orleans, La.—*Fastening the Ends of Cotton Ties.*—June 25, 1867.—Rounded studs for the bights of the wire are cast upon the plate or plates, which form a connecting link.

Claim.—The device A, when constructed as herein described for the purpose set forth.

66,066.—JOHN A. BASSETT, Salem, Mass.—*Gas Carburetor.*—June 25, 1867.—The capillary material in the chamber is saturated by a regular flow of hydrocarbon liquid, and a waste pipe is provided. The air is forced through the chamber, which is surrounded by a fire-proof casing. The intervening space may be heated by steam or filled with a non-conducting material.

Claim.—First, a gas-carbureting chamber surrounded by the casing of iron or other fire-proof material, substantially in the manner shown and for the purpose set forth.

Second, a gas-carbureting chamber having the inlet for hydrocarbon and waste exit arranged substantially as set forth.

66,067.—JOHN A. BASSETT, Salem, Mass.—*Apparatus for Carbureting and Regulating the Flow of Gas.*—June 25, 1867.—The air passes through a vertical series of overflow chambers containing liquid hydrocarbon and follows a sinuous course in each successively. Its pressure upon the diaphragm above actuates the valve to allow or prevent its exit. The edges of the diaphragm are enclosed between the turned-over edges at the junction of the upper and lower sections of the chamber.

Claim.—First, a regulator in combination with a closed carburetor so as to regulate the flow of gas after being carbureted without risk of leakage, substantially as described.

Second, the construction of a gas regulator substantially as shown and described.

Third, retaining the diaphragm H in place and the gas joint made at the flanges, substantially as specified.

Fourth, a diaphragm prepared with the composition described, or its equivalent, when used for this purpose substantially as set forth.

Fifth, a diaphragm composed of two or more sheets of flexible material, enclosing a sheet of malleable metal, in the manner and for the purpose as shown and described.

66,068.—JOHN A. BASSETT, Salem, Mass.—*Carbureting Gases.*—June 25, 1867.—Hydrocarbon in a graduated stream is supplied to the capillary material in the chamber through which the air passes. An overflow chamber below the air chamber receives the

excess. The two chambers of liquid may alternate in their action by rotation to bring them alternately above.

Claim.—First, the arrangement of a hydrocarbon reservoir above and connected with a carbureting chamber, either with or without capillary, substantially as set forth.

Second, the overflow receptacle connected with the carbureting chamber, for the purpose set forth.

Third, the process of carbureting gases for illumination by the method substantially as specified.

66,069.—JOHN A. BASSETT, Salem, Mass.—*Carbureting Gases for Heating and Illuminating.*—June 25, 1867.—The blast of air upward through the annular chamber around the nozzle of the axial pipe, draws air through the latter and ejects a spray against the dome. The surplus liquid returns by a pipe and the air passes to the holder of carbureted air. Atmospheric air may be admitted directly in the spray chamber.

Claim.—First, the process of charging gases with the vapor of atomized hydrocarbon fluids for illuminating and heating purposes, substantially as set forth.

Second, the apparatus as shown and described, with the several parts or their equivalents, when used for this purpose for carbureting air or gases for illuminating and heating purposes, in the manner substantially as set forth.

66,070.—JOHN A. BASSETT, Salem, Mass.—*Manufacture of Illuminating Gas.*—June 25, 1867.—Explained by the claim.

Claim.—First, the process herein described for the manufacture of illuminating gas, which process consists in charging a mixture of coal gas, or its equivalent, and air with the vapor of any suitable hydrocarbon liquid, substantially as described.

Second, the improved illuminating gas made substantially as set forth.

66,071.—JOHN A. BASSETT, Salem, Mass., assignor to JOHN H. IRWIN and ISAAC SIMMONS.—*Manufacture of Illuminating Gas.*—June 25, 1867.—The air flows downward into the chamber, where it follows a sinuous downward course over the succession of overflow pans and thence upward to a somewhat higher exit, so as to allow the accumulation of gas on the floor of the chamber to act as an air trap.

Claim.—First, the manufacture of an illuminating gas from the vapor of gasoline or other volatile hydrocarbon liquid, when the apparatus used is placed above the point of combustion, and so arranged that the gas is distributed to the burners by its own gravity.

Second, a series of two or more pans or receptacles for oil B B, so arranged one above another within the case A as to produce a large carbureting surface, and at the same time admit a current of air to pass automatically down over the surface of the oil in the pans, substantially as and in the manner set forth.

Third, the combination of the pipe F and case A, when so connected that the oil flowing over into the bottom of the carburetor will stop the passage of the gas into the pipe F, and thereby extinguish the lights before the oil will flow down said pipes.

Fourth, in combination with inlet for air D, the pipe G, when arranged and operated substantially as and for the purpose set forth.

66,072.—JOHN E. BLAKE, Norwich, Conn.—*Construction of Fire-arms.*—June 25, 1867.—The barrel and frame are cast in one piece, the latter being partially enclosed by the haudle. Slots and notches receive the hammer trigger, and their trunnions, and these pieces are held in position and operated by a spring, whose bent end is planted in another notch of the frame.

Claim.—The fire-arm, constructed as described, and provided with notches *e f* and *g* in the stock, arranged in relation with each other to form the bearings for the trunnions of the hammer and trigger, and for the heel of the spring, as shown and described.

66,073.—WM. G. A. BONWILL, Dover, Del.—*Shoestring Fastener.*—June 25, 1867.—The cord is looped around the hooks on alternate sides of the slit, and being rove through an eyelet on the upper edge and an outer ring, its bight is clamped between the two when the cord is strained.

Claim.—The combined fastening A I, arranged to operate substantially as and for the purpose set forth.

66,074.—GEORGE E. BURT, Harvard, Mass.—*Hay Spreader.*—June 25, 1867; antedated December 25, 1866.—By the described arrangement a positive, accelerated motion is given to the tines while they act on the hay before them, which clears them and obviates clogging; they are yet free to spring back when encountered by an obstacle. The rake balances the tedder and either or both may be used without interference one with the other. The tedder is thrown in or out of connection with an internal gear.

Claim.—First, the forks *f*, when so operated as to revolve around a common centre and at the same time to have an oscillatory motion communicated to them by the positive action of mechanism, by which their points shall be thrown forward with an accelerated motion when acting upon the hay, and be retracted when throwing off the hay, substantially in the manner set forth.

Second, so arranging the revolving shaft L that it shall pass eccentrically through the dead centre U, and receiving motion from the wheel W, through the pinion P, shall communicate it to the fork *f*, substantially in the manner set forth.

Third, the combination of the shaft L, placed eccentrically to the centre of the rotating heads *b*, with the arms *d*, shafts *a*, and forks *f*, substantially in the manner set forth.

Fourth, the balancing of the tedder by the rake, substantially as described.

66,075.—H. W. BUTTERWORTH, Philadelphia, Pa.—*Steam Drying Cylinder.*—June 25, 1867.—The hollow trunnion enters the chamber in the hollow standard through which the fluid passes. The annular packing around the trunnion is condensed by a follower actuated by an axial set screw.

Claim.—First, the standard or bearing B, with its chamber *h* and opening *f*, in combination with the tubular spindle A projecting into the said chamber, a packing ring *i*, and follower D, or its equivalent, the whole being constructed and arranged substantially as and for the purpose described.

Second, the combination of the follower D and a screw stud turning in the follower and projecting through the standard, substantially as and for the purpose set forth.

66,076.—NICHOLAS CLUTE, Schenectady, N. Y.—*Dumping Wagon.*—June 25, 1867.—In discharging, the rollers of the body work under the metallic plates of the bed frame until the tilting position is reached. Stops arrest it in its forward position and catches secure it. Crank shaft and pinions on the bed engage racks on the body to move the latter.

Claim.—The plates on the bed frame, in combination with the rollers connected to the body or movable frame, or their equivalents, substantially as described.

Also, the stops at the rear end of the movable frame, provided with catches to lock it to the bottom frame, substantially as described.

Also, in combination with the plates and rollers above claimed, the crank shaft, pinion, and rack fastened to the movable frame.

66,077.—FREDERICK W. DEVOE, New York, N. Y.—*Can and Pail for Holding Paint.*—June 25, 1867.—The hooks are soldered to the upper part of the can and turned over, so as to penetrate the wooden cover and hold it securely.

Claim.—The hooked tongues C, arranged at the upper edge of the pail or can and in relation with the cover B thereof, substantially as herein set forth, for the purpose specified.

66,078.—DANIEL ELLENWOOD, JR., Garrettsville, Ohio.—*Machine for Shrinking Tires.*—June 25, 1867.—The tire is embraced between the shoulder and flange and then clamped at points on each side between the flanges on the ends of the levers and the toothed cams thereon. The levers are moved by the right and left-hand screws, bringing the side clamps toward each other and upsetting the tire.

Claim.—First, the frame A, yoke B, and flange F, in combination with the adjustable shoulder D, for the purpose and in the manner specified.

Second, levers I, cams K, as arranged and operated by the screw H, and adjustable nut J, in combination with the frame A, shoulder D, flange F, and yoke B, for the purpose and in the manner as set forth.

Third, sections *c* and *b*, in combination with the flange F and shoulder D, for the purpose herein set forth.

66,079.—SAMUEL C. GOODSSELL, New Haven, Conn.—*Hoisting Device.*—June 25, 1867.—The cord is wound on two barrels of different diameters and its bight sustains a pulley. The barrels are connected together so as to rotate with similar speed and in opposite directions. Either of two hoisting pulleys may be connected with the drums, the one working the same with greater speed and the other with greater power.

Claim.—First, a hoisting apparatus, in which the cylindrical or conical winding drums, whether of the same or of unequal diameters, are combined with the hoisting rope and pulley and gears under the arrangement herein set forth, so that the weight shall be raised or lowered by a differential motion.

Second, the combination of the conical or cylindrical winding drums and their gears, of the hoisting rope attached to said drums under the arrangement herein described, so that when the drums are not caused to rotate by their operative mechanism the weight suspended from the said rope shall cause the locking of the gears, as set forth.

Third, the combination, in an apparatus such as described, of the winding drums or cylinders and their gears with the mechanism for rotating the same, arranged and operating as herein shown and specified.

Fourth, the combination, in an apparatus as described, of the winding cylinders and mechanism for revolving the same with the truck wheel upon which the said apparatus is mounted, under such an arrangement that by the movement of the cylinders the said wheels may be rotated and the apparatus moved in either direction, as set forth.

Fifth, the combination with the truck wheels, winding cylinders, and mechanism for revolving the same, of the clutches for throwing said wheels in and out of gear with said cylinders and driving mechanism, substantially as shown and specified.

66,080.—CHARLES HARRIMAN, New York, N. Y.—*Vacuum Pan Sugar Boiling Apparatus.*—June 25, 1867.—Attached to the vapor chamber, which is between the pan and the air pump, is a pipe containing liquid, and of a length greater than the height to which a column of water extends by atmospheric pressure. Saccharine matters carried off in the vapor are caught in this pipe without affecting the vacuum.

Claim.—The combination with an apparatus substantially of the character specified, of a Torricellian pipe or tube E connecting the receiver C, with a vessel or vessels below, essentially as and for the purpose herein set forth.

66,081.—G. W. HARRIS and WM. H. HAIGHT, New York, N. Y., assignor to WM. H. HAIGHT, same place.—*Chuck.*—June 25, 1867.—The rotation of the ring projects the jaws, and closes them upon any small article.

Claim.—The operating ring *e*, constructed with the internal screw *g* and the nut B, formed with radial grooves *e'*, in combination with the conical shell A and sliding jaws C, substantially as and for the purpose herein described.

66,082.—JOHN E. HAWKINS, Lansingburg, N. Y.—*Cracker Machine.*—June 25, 1867.—The dough is formed into a series of lengthened cylinders from which thin disks are cut, which are pressed, pricked, and stamped at a single operation upon an endless apron, from which they are delivered on to pans of sheet metal.

Claim.—First, the conducting tubes divided into two parts T and T', in combination with the knife K, working between them substantially as described.

Second, the knife K, consisting of a thin plate of sheet metal, provided with holes for the dough to pass through, in combination with a spring to throw the knife and the lever *i* and cam *v'* to move back the knife, so that the dough can again pass through the holes, substantially as described.

Third, the outside tubes or thimbles working on

the lower sections T' of the conducting tubes, and operated substantially as described.

Fourth, the docker, consisting of the plates *o p r* and *s*, the prickers *v*, stamper *W* and spiral springs *S* and *u*, all combined, constructed, and operating substantially as described, to press, prick, and stamp a row of crackers at one operation, substantially as described.

Fifth, the mechanism moved by a crank on the main driving shaft, by means of which an intermittent motion is given to the grooved rollers, the endless apron and the docker, substantially as described.

Sixth, in combination with the docker the thin plate *R*, constructed, arranged, and operating substantially as and for the purpose described.

66,083.—F. C. HESSE, Cincinnati, Ohio.—*Hot Air Furnace.*—June 25, 1867.—The fireplace is chambered in its lower section. The inner shell is perforated at top for passage of air from an annular chamber. A series of warm-air tubes of upwardly increasing diameter extend from the annular air chamber surrounding the furnace to the air chamber in the crown of the stove.

Claim.—First, the annular supply chamber *I*, provided with the dampers *f f'*, when secured to the bed plate *A*, or its equivalent, having the perforations *e*, substantially as and for the purpose specified.

Second, the casing *F* having perforations *a'*, the incline perforated plate *b* attached thereto, and the diaphragm *K'*, all in combination with the base plate *A*, with perforations *a*, the inner wall *B'* of the dead-chamber and the top plate *C*, substantially as described.

Third, the base plate *A*, walls *B B'* and top plate *C*, in combination with the fire pot *G*, perforated fire back *H*, diaphragms *K K'*, warm-air tubes *L*, casing *F*, hot-air reservoir *N*, smoke pipes *O* and *Q*, smoke stack *P* and damper *P'*, constructed and arranged substantially as and for the purpose specified.

Fourth, the hot air reservoir *N*, smoke pipe *O*, smoke stack *P*, having an opening *P'* near its bottom, and the damper *P'* for closing the same, in combination with the smoke pipe *Q*, substantially as described.

66,084.—JACOB J. HESSLER, Reading, Pa.—*Curtain Fixture.*—June 25, 1867.—The blind cord engages the sliding knob, and is kept taut by the spring.

Claim.—The sliding knob *B* working through the slot *b* of the barrel *A*, and arranged in relation with the rod *c* and spiral spring *d* contained in the said barrel, substantially as and for the purpose specified.

66,085.—WM. H. HOLLAND, Chelsea, Mass.—*Rotary Steam Engine.*—June 25, 1867.—The common shaft of the two cylinders carries a fly wheel between them. This fly wheel has cam grooves on its sides by which the piston abutment is worked. The pistons are so coupled together that one portion shall carry the other over the dead centers. A slide valve worked by a hand lever enables reversion of the engine. The steam passes through the chambered piston journals and drum.

Claim.—First, the chambered drum *E* and journals *F F*, when constructed and operating substantially as described and for the purpose set forth.

Second, the groove or depression *x x* on the drum on each side of the piston, as and for the purpose described.

Third, the arrangement of the packing on the upper portion of the abutment *D*, as described.

Fourth, the arrangement of the packing piece *w*, placed at the bottom of the abutment groove for the purpose of packing the space between the end of the abutment and the drum *E*, and also between the drum and the cylinder over the packing rings as described.

Fifth, the arrangement of the spring *o*, with the abutment *D*, drum *E* and groove or depression *x*, as and for the purpose set forth.

Sixth, the exhaust passage *p*, one or more placed in the cylinder for the purpose of relieving the abutment of the pressure of the steam just previous to its being raised to allow the piston to pass.

Seventh, the arrangement of the fly wheel or pulley, provided with cams between cylinders, as shown.

66,086.—JOHN HOSFORD, Monroeville, Ohio.—*Harness Pad.*—June 25, 1867.—The upper and under plates of the tree are secured together by screws and nuts, and clamp the edges of the pad pieces, so as to obviate sewing. The leather strap lies between the flanges of the upper plate.

Claim.—The arrangement of the upper tree *C* and flanges *a*, in combination with the lower tree *A*, when combined with the usual adjuncts to form a harness pad.

66,087.—PLATT C. INGERSOLL, Greenpoint, N. Y., assignor to himself and H. F. DOUGHERTY, same place.—*Bale Band Tightener.*—June 25, 1867.—The bight of the rope is clamped between the interlocking links so as to be tightened by the handspike to which they are pivoted.

Claim.—The clamping links or grippers *B C*, in combination with each other and with the lever *A*, substantially as herein set forth for the purpose specified.

66,088.—PLATT C. INGERSOLL, Greenpoint, N. Y., assignor to himself and HORACE F. DOUGHERTY, same place.—*Seeding Machine.*—June 25, 1867.—The rotary hopper has circumferential openings guarded by adjustable slides. The discharge holes are brought consecutively to the opening in the case, which is closed by a lever slide to put the seeding apparatus out of operation. A share precedes the furrowing wheel; the seed dropper follows, and a drag bar in the rear covers the seed.

Claim.—First, the combination of the series of adjustable slides *c* with the series of holes or openings *b*, formed in the circumference of the rotating hopper *C*, substantially as and for the purpose herein set forth.

Second, the adjustable sliding gate *C**, arranged in relation with the rotating hopper *C*, substantially as and for the purpose specified.

Third, the lever *g*, combined in relation with the sliding gate *C**, and rotating hopper *C*, substantially as and for the purpose specified.

Fourth, the transverse spurs or projections *j*, arranged in relation with the angular circumferential rib *i*, of the furrowing wheel *F*, substantially as and for the purpose specified.

Fifth, the drag-bar *D*, arranged in rear of the seed-dropping mechanism, and furnished with covering shares, constructed as described, substantially as and for the purpose specified.

Sixth, the lever *H*, and lifting cords or chains *n r*, arranged in relation with each other and with the furrowing wheel and drag bar, substantially as and for the purpose specified.

66,089.—PLATT C. INGERSOLL, Greenpoint, N. Y., assignor to himself and HORACE F. DOUGHERTY, same place.—*Preparing Cotton Seed for Planting.*—June 25, 1867.—Explained by the claims and illustration.

Claim.—First, the process of preparing cotton seed for planting by subjecting the same to a rubbing action between a corrugated and a rubbing surface, substantially as herein set forth.

Second, the corrugated rubber, in combination with the bed having a roughened surface, substantially as and for the purpose specified.

66,090.—GEORGE JACOBS, Washington, D. C.—*Burglar Alarm Lock.*—June 25, 1867.—A spring arm rests upon the verge when the bolt is projected, and the retraction of the latter raises the arm from the verge and the alarm is sounded.

Claim.—First, the employment of arms *L N O*, for the purpose of holding and letting off the alarm arrangement, substantially in the manner set forth.

Second, in combination with the above, the sliding pivot *C*, and spring *e*, substantially as and for the purpose described.

Third, the circular plate *D*, provided with deceptive holes, in combination with arms *L N O*, operating substantially as specified.

Fourth, the arrangement of bolt *A*, arms *L N O*, spring *M*, sliding pivot *C*, and plate *D*, substantially for the purpose described.

66,091.—BARTON H. JENKS, Bridesburg, Pa.—*Spindle Bearing.*—June 25, 1867.—The bolster is

spherical with upper and lower tubular projections, and its upper half is enclosed by a cap attached to the rail into which the lower part is sunk. The bolster has a limited motion in its bearings.

Claim.—The combination of the bolster cap and rail, arranged as shown and described, and constructed and operating as set forth.

66,092.—CHARLES KAISER, New York, N. Y.—*Rotary Steam Engine.*—June 25, 1867.—The semi-annular piston is pivoted to the piston wheel, allowing the packing of its rear end to the cylinder by the steam pressure, and is carried around between the inner face of the cylinder and segmental guide blocks, which are attached to one cylinder head. The revolving piston reciprocates the slide valve, which is guided between the two blocks in a diametric course. The exhaust takes place into an annular space between the two shells of the cylinder. The slide valve has a slot for the traverse of the piston shaft.

Claim.—First, the segmental piston B, moving in the cylinder A, in combination with the transversely sliding valve C, constructed and operating substantially as and for the purpose described.

Second, connecting the piston B to the piston wheel F, in such a manner that it is free to rock, substantially as and for the purpose set forth.

Third, the slide valve C, and segmental piston B, in combination with the jacket J on the cylinder, constructed and operating substantially as and for the purpose set forth.

Fourth, the cut-off K, in combination with the slide valve C, segmental revolving piston B, and cylinder A, constructed and operating substantially as and for the purpose described.

66,093.—FREDERICK LEACH, Tioga, N. Y.—*Machine for Pressing Peat.*—June 25, 1867.—The peat is placed in the receiving box, to the end of which the mold box is advanced. The moving plunger compresses the peat into the mold, and upon the retraction of the latter the fixed plunger ejects the block.

Claim.—First, the combination of the receiving box A with the mold box B, stationary plunger D, and pressing plunger C, when said mold box is operated by any suitable means, as described, and the plunger C, actuated by fluid under pressure, essentially as set forth.

Second, the combination of the rams K E, cylinders F L, pressing plunger C, mold box B, with its stationary plunger D, and receiving box, substantially as shown and described.

Third, the combination with the ram K of the cylinder and its pressing plunger, of valves controlling the supply of the operating fluid thereto from different sources or under different pressures, essentially as specified.

Fourth, the automatic operation of the mold box and pressing plungers under different heads or pressures by separate and distinct valves, geared together for operation by the mold box and pressing plunger, substantially as herein set forth.

Fifth, the valve R, constructed for operation and adjustment, essentially as shown and described.

66,094.—CHAPMAN LEE and JOSEPH PAUDLER, Washington, D. C.—*Curtain Fixture.*—June 25, 1867.—The cord wheel has a spur gear engaged by a gear wheel, which is rotated by a winch.

Claim.—First, the combination of a gear wheel and pinion with the cord wheel, for operating a window curtain roller, substantially in the manner set forth.

Second, the combination of the spring D, locking bolt C, and slide E for tightening the cord in connection with the notched plate A and cord wheel B, substantially as described.

66,095.—WILLIAM B. LODGE, Danbury, Conn.—*Fulling Stock.*—June 25, 1867.—The working edge of the beater has a cushion of rubber and works against an apron of rollers. The force of its fall is modified and its return assisted by a cord and spring. As it falls it impinges against a cam, which slightly raises it, giving it a rolling action as it strikes the material under treatment.

Claim.—First, the combination with the hammers or beaters B of the cam or friction blocks C, operat-

ing to effect the lift of the former and to suddenly release them when raised, substantially as specified.

Second, the combination, with the hammer or hammers of the mill, of an adjustable spring tension device, arranged to control their fall, essentially as herein set forth.

Third, the combination toes G, made of india-rubber or other analogous soft material, with the hammers B, substantially as specified.

Fourth, the combination with the heater B of the hot water box or bath J and the bosom H I operating on the material being fulled, substantially as specified.

66,096.—WM. B. LODGE and H. PLATNER, Danbury, Conn.—*Machine for Sizing or Planking Hat Bodies.*—June 25, 1867.—Improvement on their patent, Dec. 14, 1866. The intermediate belt of lags is the working apron; the upper and under aprons may have a different velocity or merely act as beds. A shell at the exit of the upper apron aids in discharging the work. In the arrangement for returning the work to continue the operation, a roller and board keep the felt clear of the lower apron till it is caught by the apron above. Steam is introduced between the aprons, the upper and under ones of which are counterweighted and vertically adjustable.

Claim.—First, the combination with the upper and middle aprons E F, arranged to travel as described, of the shell Q at the exit end of the upper apron, essentially as and for the purpose specified.

Second, the combination, with the aprons E and F of a guideboard R and roller S at the feed end to said aprons, travelling as described, substantially as herein set forth.

Third, in combination of endless lag aprons, appertaining with their contiguous surfaces in opposite directions, as and for the purposes specified, the arrangement of a steam pipe or coil for the introduction of steam between said aprons, essentially as specified.

Fourth, the combination with the vertically adjustable aprons F and F' of counterbalance weights, or their equivalent, to facilitate the adjustment of the same relatively to a center or fixed apron, substantially as described.

66,097.—WM. B. LODGE, Danbury, Conn., and H. PLATNER, Hudson, N. Y., assignors to themselves and F. SHALLER, Hudson, N. Y.—*Machine for Sizing Hat Bodies.*—June 25, 1867; antedated June 15, 1867.—Explained by the claims and illustration.

Claim.—First, in hat planking machines, the arrangement of three or more endless belts or aprons of lags, made to travel with their contiguous faces or surfaces in opposite directions, all at different velocities, relatively to each contiguous one, substantially as specified.

Second, the combination with an endless belt or apron E of lags having a fixed or positive motion of two or more endless lag belts or aprons F and F', arranged as specified, and so geared to operate in connection with the belt E as that they, F and F', can, during the progress of the work, be made at pleasure to travel with their surfaces adjacent to E in a reverse direction, at a reduced velocity relatively thereto, or be left free to act independently of it, substantially as described.

Third, the combination of the lag belts E and F or F', drums B and B' or B₂, at the one end of the machine, wheel P, levers U or U', and wheels Q and S or R and T for operation, essentially as and for the purposes herein specified.

Fourth, constructing the sideboards D¹ with their rails c¹ in sections, and holding or uniting them by springs or weights or screw bolts, to give the lag apron F or F¹ a vertically flexible character, substantially as herein set forth.

Fifth, the combination with a stationary arranged endless lag belt or apron E of one or more lag aprons F or F¹, arranged to travel at a reduced velocity and relatively to the belt E, as specified, and made vertically adjustable in relation thereto by means of lifting cams G G¹, or other suitable devices, essentially as specified.

Sixth, the combination with an endless lag belt or apron E, having inflexible rails or guides c, of an endless lag belt F or F¹, with its rails or guides c¹ made in sections and flexible, said aprons E and F or F¹

being arranged and operating relatively to each other, substantially as described.

66,098.—DAVID MCFARLAND, Worcester, Mass.—*Machine for Setting Card Teeth.*—June 25, 1867.—Cannot be briefly described other than substantially in the words of the claims.

Claim.—First, the combination with the clamp which feeds the wire of the following mechanism, viz., the lever D, whether adjustable or not, arranged to operate between the clamp and the operating cam so as to give to the clamp its lateral motion, and a separate and independent clamping lever or device for actuating the clamp to hold and feed the wire, substantially as set forth.

Second, the combination of the feed lever D, spring clamping lever E, and wire holding lever F with the clamp *a*, substantially as set forth.

Third, the combination with lever D of the fulcrum pin or stud *b*, collar *m*, and adjusting screw *p*, or equivalent means for making the collar adjustable, substantially as and for the purposes set forth.

Fourth, in a machine such as described, the construction and arrangement of the lever for producing the feed, substantially as described.

Fifth, the combination of the doubler plate K and crowner bar R with the doubler P and doubler bar O, made adjustable, as and for the purposes set forth.

Sixth, the combination with the wing plate T, crowner bar R, and cam block 17, of the compound or three-functioned cam V, all constructed and operating in relation to one another and to the doubler plate K, substantially as and for the purposes set forth.

Seventh, the combination with the clamp *a* of the bow or plate spring *g* and spiral spring *h*, arranged for joint operation, substantially as and for the purposes set forth.

Eighth, the combination with the perforating bar of the mechanism for operating the same, arranged as herein described, so that the said bar may be elevated before its forward motion is imparted, for the purposes stated.

Ninth, the combination with the upright dogs 42 and 43 and double inclined and grooved cam 44 of the holding box 46, substantially as and for the purposes set forth.

Tenth, the combination of the ratchet wheel 41 of the retaining dog 45, feeding dogs 42 and 43, double inclined and grooved cam 44, and holding box 46, arranged for joint operation, substantially as and for the purposes set forth.

Eleventh, the combination with the stop lever D' of the stop guard F', substantially as and for the purposes set forth.

66,099.—A. MCKENNEY, Portland, Me., and S. CARPENTER, Patten, Me.—*Boot Lacing Device.*—June 25, 1867.—The lids have fixed studs at one end for attachment to the shoe and rings at the other for the passage of the string. The stud passes through the vamp and the link lies between the leather and lining, the rings only projecting beyond the edge.

Claim.—A shoe lacing device constructed to operate substantially as set forth.

66,100.—JOHN MCMURTRY, Lexington, Ky.—*Spike.*—June 25, 1867.—The beveled end of the spike causes the shank to curve by insertion. The catch shoulder imbeds itself in the wood and prevents retraction.

Claim.—The within described spike, consisting simply of a single shank provided with a beveled or sloping end and shoulder, said shoulder and beveled end being upon the same side, as and for the purpose set forth and described.

66,101.—LOTTO P. MEYER, Bethlehem, Pa.—*Manufacture of Safety Matches.*—June 25, 1867.—Chlorate of potash, 56; gelatine, 20; powdered quartz, 24 parts, with water sufficient as a dip composition for the waxed splints. The friction surface is composed of red prussiate of potash and gelatine.

Claim.—First, the application of certain ingredients, substantially such as herein specified, for the preparation of a compound for safety matches, and for the purpose specified therein.

Second, the application of certain ingredients, substantially such as herein specified, for the prepara-

tion of special surfaces for the ignition of safety matches, and for the purpose specified within.

66,102.—ARTHUR G. MORVAN, South Bergen, N. J.—*Making Photographic Transfers.*—June 25, 1867.

—The photographic paper is dipped in sour milk and then dried. French gelatine $\frac{1}{2}$ pound is dissolved in a pint of boiling water and a solution of permanganate of potash, $\frac{1}{4}$ oz.; water, 1 quart, is added thereto. This composition is applied when cool to the face of the paper, which, after drying in a dark room, is ready to receive the photographic impression from the negative. The permanganate of potash is to prevent the coagulation of the gelatine before exposure to the light. After taking the impression, and before developing the same, the impressed side is coated with a composition of Judea bitumen, white wax, Burgundy pitch, in equal parts, dissolved in essence of lavender, then allowed to dry in the dark. For developing the picture the proof is washed in a bath of cold water, which dissolves the permanganate in those parts which have not been acted on by the light; the water carries with it the outer coating. The picture is then transferred to stone, metal, or wood.

Claim.—First, the combined process hereinbefore described for making photographic transfers by means of the several methods, preparations, applications, and compositions above described, or their equivalents.

Second, the preparation of the paper by a bath of whey or lactine as above described, when used in combination with the other elements of the process above described, or their equivalents.

Third, the preparation and application of the coating of gelatine, or its equivalent, and permanganate of potassa, for the purposes above described, whether the same is used in combination with the other elements of my entire process, or is used separately therefrom as a material to be acted on by the light, and subsequently to be dissolved and removed where it has not been so acted upon.

Fourth, the use of a paper so prepared and coated as above described in the formation of the impression thereon by the action of the light according to the usual modes.

Fifth, the preparation and the application of the second coating above described, composed of Judea bitumen, white wax, and Burgundy pitch, or their equivalents, without grease or oil, for the purposes above described, whether the same is used in combination with the other elements of my entire process, or is used separately therefrom as a material to give color to the picture on the paper, and to act as a medium for transferring it.

Sixth, the removal of both the coatings above described from the parts or spaces not acted on by the light by placing the paper so prepared and coated with the materials above described, or their equivalents, in a bath of cold water in the manner above described, and cleaning it in the manner above described, or by any equivalent method of solution and removal.

Seventh, the impressing of a photographic picture or design or printed or written matter upon stone, wood, or metal from a paper proof, made and prepared as above described, for the purpose of engraving, lithographing, etching, or preparing plates for printing such picture, design, or printed or written matter.

66,103.—A. M. OLDS, New York, N. Y.—*Spring Hinge.*—June 25, 1867; antedated June 15, 1867.—The pintle is formed on one plate by cutting slots to receive the curved parts of the other plate. This latter has two slits, leaving between them a spring plate to rest against flattened portions of the pintle and hold the hinge open or shut.

Claim.—The hinge constructed substantially as described.

66,104.—HENRY T. POTTER, Norwichtown, Conn.—*Ring Traveller for Spinning.*—June 25, 1867.—The transverse bar rotates freely within the ring and in contact with the spindle or the yarn, so as to direct the latter to the spindle at a uniform angle and tension. The end bearings of the bar are retained by an annular plate above.

Claim.—First, the transverse bar *e*, in combination

with the ring and spindle, substantially as and for the purpose specified.

Second, the annular plate *b*, arranged in relation with the transverse bar *c*, the ring and the spindle, substantially as and for the purpose specified.

66,105.—CARL H. RAMSTEN, Carlskrona, Sweden.—*Boat-Detaching Tackle.*—June 25, 1867.—The hooks of the davit fall-blocks have locking levers which rest against the sides of the blocks, and are held by levers which are simultaneously disengaged by casting off a rope to which they are both connected.

Claim.—A tackle block *D*, provided with a locking lever *E*, to a hinged or pivoted detaching hook *S* and fair leaders *I*, all arranged substantially as described and for operation in connection with or by a rope or chain *H*, substantially as specified.

66,106.—NATHAN L. REVERE, Worcester, Mass.—*Stirrup.*—June 25, 1867.—A spiral spring and case are attached respectively to the stirrup and the stirrup leather, to give an elastic bearing for the foot.

Claim.—The combination of the stirrup *E* and strap *A* of the case *B*, (having ears *c c* and a pin *b*), spiral spring *e*, piston rod *C*, and head *D*, said parts being constructed and arranged to operate in relation to each other substantially as and for the purposes set forth.

66,107.—J. STRAYER and T. HAZELHURST, South Bend, Ind.—*Bolt Cutter.*—June 25, 1867.—The cutter dies slide in radial grooves in the chuck, and are adjusted by bolts, which traverse radial slots in a rear plate and enter holes in the dies. The adjusting bolts have nuts by which they are secured.

Claim.—First, the bolts *E*, in combination with the cutters *C* and springs *G*, arranged and operated substantially as above described.

Second, the combination of the springs *G*, cutters *C*, chuck *B*, and bolts *E*, substantially in the manner and for the purposes set forth.

66,108.—RICHARD TATTERSHALL and JOHN A. BURCHARD, Beloit, Wis.—*Gate.*—June 25, 1867.—A wheel of the carriage is driven against a crank on the horizontal shaft which crosses the track. The shaft is connected by rods and cranks with a tipping segment on which the gate is supported so as to incline it to open or close by gravity, its roller running on the curve and its heel post being connected by hinges to the gate post.

Claim.—First, broadly, the oscillating circular plane *E*, for the purpose set forth.

Second, a gate constructed substantially as described, in combination with the double sliding hinge *C C B*, the oscillating circular plane *E*, lever *I*, the crank levers *L L*, rods *K K*, bell-crank levers *S S*, the pulley *H*, standard *A*, and self-fastening latch *W*, arranged and operating as and for the purpose specified.

66,109.—JAMES WALLACE, Sheridan, Pa.—*Plow.*—June 25, 1867.—The rod slips in staples beneath the beam when the handle is oscillated, and its end pushes away trash which has collected in the angle between the beam and the standard.

Claim.—The jointed rod *D D'*, used in combination with the beam and the handle *H*, as and for the purpose specified.

66,110.—H. F. WHEELER, Boston, Mass.—*Magazine Fire-arm.*—June 25, 1867.—The flanges of the metallic cartridges slide in vertical grooves in the chamber of the handle as they are raised by the rack to be presented to the bore. The barrel, enclosed in a case, is driven rearward by a spiral spring and forward by the trigger when the latter is in its contracted state, a slot in the trigger engaging a pin in the trigger lever. The trigger, when contracted, also raises the ratchet bar feeding the cartridges. When drawn to its extended state the trigger ceases to act upon the barrel and cartridge feeder and acts to free the hammer.

Claim.—First, a magazine pistol in which the cartridges are arranged in a vertical or approximately vertical chamber forming the handle, substantially as shown and described.

Second, effecting the movement of the cartridges to bring each into position to be fired by the vertical

ratchet bar *x*, carrying the cartridges transversely to itself, substantially as set forth.

Third, the flange groove or grooves and friction surface or surfaces for guiding and supporting the cartridges, substantially as described.

Fourth, the construction and arrangement of the expanding and contracting trigger lever, by which, as the resistance to the forward movement of the barrel increases, the length of the acting arm of the lever decreases, substantially as shown and described.

66,111.—T. R. WHITE and W. G. BEDFORD, Philadelphia, Pa.—*Driving Belt.*—June 25, 1867; antedated June 15, 1867.—Explained by the claim.

Claim.—A driving belt, composed of wires corrugated or bent as described and threads of cotton or other fibrous material interwoven as set forth.

66,112.—F. W. and E. T. ALBERTINE, Hanover, Conn.—*Guide for Carding Machines.*—June 25, 1867.

—By means of the divisional guide and roller the slivers are spread over the whole surface of the cylinder, preventing the tumbler, cylinder, and "fancy" from being worn in creases.

Claim.—First, the guide plate *A*, perforated and slotted substantially in the manner herein shown and described and for the purposes set forth.

Second, the combination of the roller *E* with the guide plate *A*, substantially as herein shown and for the purpose set forth.

66,113.—DAVID D. BAKER, West Alexandria, Ohio.—*Gate.*—June 25, 1867.—The gate is raised upon its post by a compound leverage. The lower lever is of the first class, and is pivoted to the gate; it abuts upon the lever of the second class, which is pivoted to the post and gate and raises the latter. The raised position is maintained by a pin in the perforated bar.

Claim.—The combination and arrangement of the levers *c d*, post *e f*, clamp hinges *x z*, and slot bar *i*, when constructed, arranged, and operating conjointly in the manner described for the purpose specified.

66,114.—FREDERICK BALLARD, Waverly, Md.—*Thill Coupling.*—June 25, 1867.—The rubber is contained in a box, which is raised by a set screw, whose point enters the rubber. The eye of the thill iron has a bushing of soft metal on the square bolt, which is held from rotation in the ears of the clip.

Claim.—First, the combination of the spring *G*, box *F*, and pressure bolt *E*, constructed and operating in the manner and for the purpose specified.

Second, the soft metal bushing *K*, provided with a square opening *k*, and used in combination with the bolt *D* and tubular eye *I'* of the thill iron, substantially as described.

66,115.—ALBRO BARBER, Port Byron, Ill.—*Picture Holder.*—June 25, 1867.—The photographs are brought in succession to the glass without being exposed. The picture in front is dropped into the lower section, exposing the one behind it, and the back one of the lower is placed in rear of the upper tier. The motion of the upper cross-piece actuates the frames by means of catches, and springs drive the frames into their proper places in the tiers.

Claim.—A holder for photographic or other pictures, in which a series of frames for the pictures is so arranged that by moving or drawing one end of the box out or in, such frames in regular order and succession will be brought in position for being viewed, substantially as described.

66,116.—JAMES T. BARNES, Hudson City, N. J.—*Caster.*—June 25, 1867.—The socket is secured by spurs in the leg of a piece of furniture. The spindle is pivoted in an arm projecting from the axle, which is supported by two wheels.

Claim.—First, the axle *A*, supporting two wheels *B*, and having secured at its center and at right angles thereto the arm *C*, supporting the shaft *D*, constructed as described for the purpose specified.

Second, the securing of the socket or sheath *E*, in the leg or bottom of the article to which the caster is applied, by means of the spurs *d d*, projecting laterally from the cylindrical part *a*, and fitted in the hole *c*, which receives said part *a*, substantially as shown and described.

66,117.—E. BECKER, Cincinnati, Ohio.—*Roofing*.—June 25, 1867.—The upper edge of a lower section is bent upward, and the lower edge of the upper sheet is doubled over above and upon it.

Claim.—The curved edge and doubled-over edge of the two overlapping edges of the metallic plates A, substantially as and for the purposes described.

66,118.—GEORGE BELL, Martinsburg, W. Va., assignor to himself and JONATHAN STRINE, same place.—*Blacksmith's Striker*.—June 25, 1867.—The axis of the hammer is pivoted to the summit of an upright gate which slides in guides, and is adjustable in its supporting standard by means of rack and pinion. The hammer is depressed by a treadle and chain, whose length is proportioned to the height of the gate. The hammer rebounds against a spring, and is raised by another spring after striking the blow.

Claim.—The combination of the spring R, adjusting device V, frame V, hammer and lugs C J, chain K, and treadle L, all constructed and arranged as described.

66,119.—JOSEPH BESSO, Philadelphia, Pa.—*Extracting Grease and Oils from Animal and Vegetable Substances*.—June 26, 1867.—The suint of wool, and the grease and oil of bones, seeds, &c., are extracted. The wool, for instance, is placed in the retorts and exposed to a stream of bisulphuret of carbon, which carries off the fatty matters to the alembic. Steam, following the same course, vaporizes the bisulphuret of carbon, which is condensed and returned to the reservoir, leaving the adipose matters to be utilized.

Claim.—First, the improved apparatus consisting of the reservoir A, the force pump B, the retorts C C', the alembic D, the condensing vessels E E', the receiving vessels F F' P', the gasometer G, and the steam pipe h, combined, arranged, and operating substantially as and for the purpose herein described.

Second, the force pump B, in combination with the reservoir A, and the retorts C C', arranged and operating as and for the purpose herein set forth.

Third, the gasometer G, in combination with the pipe g, and the retorts C C', arranged as and for the purposes specified.

66,120.—THOMAS BIGELOW, Elkhart, Ind.—*Tinners' Rule*.—June 25, 1867.—The scale is made in three sections, connected by hinges. They are graduated for circumferences and diameters for vessels of given capacities, and for cylinders and cans with or without flaring sides. The applications cannot be briefly recapitulated.

Claim.—The arrangement and construction of a rule comprising a system of scales, in the manner as herein set forth for the purpose specified.

66,121.—CHARLES H. BLANCHARD, Boston, Mass.—*Machine for Making Starch, Paste, Size, &c.*—June 25, 1867.—Within each cylindrical vessel is a revolving shaft armed with stirrers and a brush, revolving above a perforated diaphragm. The bottom of each tank is made convex, and connects with a pipe and a spout through which the paste is delivered to the cooking vessel.

Claim.—First, the combination of the perforated diaphragms O O of the mixing tanks with the revolving brushes K K K, substantially as described and for the purpose set forth.

Second, the device, or its mechanical equivalents, for giving the shafts I I of the stirrers their reciprocating motion, substantially as described and for the purpose set forth.

Third, the combination and arrangement of the hollow steam-heated cooking rolls S S, substantially as described and for the purpose set forth.

Fourth, the combination and arrangement of the cooking tank R, the rolls S S, and the scrapers T T, substantially as described and for the purpose set forth.

Fifth, the general construction, combination, and arrangement of the several parts of the machine, substantially as described and for the purpose set forth.

66,122.—FRANK BLECKA, Elgin, Ill.—*Churn*.—June 25, 1867.—On the trunnion of the churn is attached a gear wheel, attached to the frame. As the

churn rotates, the pinions on the beater shafts receive a planetary motion around the spur wheel.

Claim.—Agitators C C', pinions L L'', and wheel T, when used in combination with a rotating case, substantially as and for the purpose set forth.

66,123.—HENRY BOURN, Mendon, Mich.—*Combined Seeder and Fertilizer*.—June 25, 1867.—Explained by the claims and illustration.

Claim.—First, in combination with the driving bevel gear wheel M, the shaft J, provided with the bevel pinion L and crank wheels I and S, for the purpose of operating the agitating mechanism in both hoppers from the same shaft, substantially as set forth.

Second, the slide F, provided with the brushes K K, and moving the same across the escape orifice in the bottom of the hopper, and for the purpose set forth.

Third, the triangular slide P, placed in the open bottom of the hopper and nearly filling the area of the same and provided with the spikes Q, as and for the purposes set forth.

Fourth, hanging one side of the hopper upon lings or other joints so that the area of the hopper bottom may be increased or diminished in the manner and for the purposes set forth.

Fifth, the seat T, adjustable forwards and backwards, as set forth, in combination with the main frame A and hoppers D O, so that the weight of the driver may be caused to balance the machine, as set forth.

66,124.—ELIAS BROCK, Ellenville, N. Y.—*Machine for Unhairing Hides*.—June 25, 1867.—A pair of rollers draw the hide over the knife cylinder, which rotates in an opposite direction, an apron holding the hide down upon the cylinder.

Claim.—First, the combination of the pair of feed rollers D E with the knife cylinder B of an unhairing machine, substantially as herein shown and described and for the purpose set forth.

Second, arranging the guide roller F, knife cylinder B, and feed rollers D E with each other and with the frame A of the machine, substantially in the manner herein shown and described, so that the hides or leather shall be drawn over the knife cylinder B in a direction opposite to that in which the surface of the said knife cylinder is moving.

Third, the combination of the roller I with the frame G, to which the apron H is attached, substantially as herein shown and described and for the purpose set forth.

Fourth, arranging the gearing K L M N O P R, substantially in the manner herein shown and described, for the purpose of communicating motion from the knife cylinder B to the feed rollers D E.

66,125.—F. J. BURCHAM, Racine, Wis.—*Machine for Softening or Dressing Leather or Skins*.—June 25, 1867.—The leather is attached by spring hooks, or equivalent, to the frame and is stretched alternately in different directions. The crank is revolved and the side frames are moved out and in by the pitmans, levers and connecting rods actuated from the central shaft and four-throw crank.

Claim.—First, the combination of the quadruple crank C, pitman D, levers E, and connecting rods G with each other and with the stretching frame to which the skin is attached, substantially as herein shown and described and for the purpose set forth.

Second, the stretching frame H, constructed and operated substantially as herein shown and described and for the purpose set forth.

Third, the stretching frame N, constructed and operated substantially as herein shown and described and for the purpose set forth.

Fourth, the clamp I, constructed and arranged substantially as herein shown and described and for the purpose set forth.

Fifth, the clamp K, constructed and arranged substantially as herein shown and described, when used for the purpose of attaching skins to a stretching frame.

Sixth, the clamp L, constructed substantially as herein shown and described, when used for the purpose of attaching skins to a stretching frame.

Seventh, the double spring-hook M, constructed substantially as herein shown and described and for the purpose set forth.

66,126.—WILLIAM J. BURGE, Atchison, Kansas.—*Knife Cleaner.*—June 25, 1867.—The handle is shod with felt and the cavity contains scouring powder.

Claim.—In a knife cleaner, the combination of the handle A, having a cavity D closed by a stopper C, and the rubbing surface or layer B, arranged, constructed, and operating in the manner as shown and described and for the purpose set forth.

66,127.—FREDERICK CATLIN, Watertown, Conn.—*Funnel.*—June 25, 1867.—The cup has a removable strainer at its upper end and an additional one above its valve chamber. A disk on the stand rests on the jug mouth, the nozzle running loosely therethrough to allow escape of air from the vessel.

Claim.—The construction and arrangement of the funnel A, having detachable throat B, strainers E F, valve C, and stand D, substantially as described, for the purpose specified.

66,128.—GEORGE W. CHAMBERS and ISHAM WASHAM, Talladega, Ala.—*Cotton Cultivator.*—June 25, 1867.—The forward journal bearing of the rotary choppers is in a transversely-sliding bar which, by a lever, disconnects the bevel pinion from its driving wheel.

Claim.—The arrangement of the lever *d* and the sliding cross-piece G to engage and disengage the bevel gear *b b*, in the manner and for the purpose herein specified.

66,129.—PETER CHANDLER, Olney, Ill.—*Portable Fence.*—June 25, 1867.—The rectangular corners are connected by notches in the projecting rails of one panel, engaging grooves of the other. The ends of the panels in the straight part of the fence lap past each other on the foundation bar, and are supported by brace pieces from the same, held by traversing pins at top.

Claim.—First, the pin *b* in combination with the braces B and battens C, substantially as and for the purpose described.

Second, in combination with the elements of the above arrangement of the battens D E, the former being provided with the notches *d d'* and retaining pin *d'*, and the latter with slotted projections *e e'*, as and for the purpose set forth.

66,130.—JAMES B. CLARK, Plantsville, Conn.—*Manufacture of Blanks for Carriage Thill Shackles.*—June 25, 1867.—The blank is stamped into form between the dies at a single operation.

Claim.—First, the carriage shaft shackle blank so formed between dies that the body *b* of the blank is curved, substantially as herein shown and described.

Second, the dies A and B for making the said blank when so constructed and arranged as to form the rounded corners and the curved body of the said blank, substantially as herein shown and described.

66,131.—ICHABOD W. DAWSON, Newark, N. J.—*Frame for Stretching Wet Leather.*—June 25, 1867.—The frame is extensible laterally, and while being extended with the hide tacked to it the resting bar around which the middle of the hide is folded is moved longitudinally forward.

Claim.—The combination and arrangement of the longitudinal bars A and B, cross bars C and D, inclined pivoted bar E, and inclined stationary bar *b*² with each other, substantially as herein shown and described and for the purpose set forth.

66,132.—JOHN DENHARD, Reading, Pa.—*Transferring Cars from one Track to Another.*—June 25, 1867.—The off wheels of the car on the side track climb upon the stationary inclined plane to surmount the off rail, and all the wheels descend the movable inclines as they assume their places on the main track. The converse action takes place when going in the other direction.

Claim.—The rails A A' of the main track and the rails B B' of a turn out or siding in combination with the stationary inclined bar *e* and the movable bars D D', the whole being constructed substantially in the manner and for the purpose described.

66,133.—R. W. DOWNMAN, Georgetown, D. C.—*Drain Plow.*—June 25, 1867.—The double mold board is followed by a double conical pressure roller.

Claim.—The attachment of the double cone roller B, as herein described, to the ordinary drain plow, in the manner and for the purposes above stated.

66,134.—JOHN EARNSHAW, East Greenwich, R. I.—*Kaleidoscope.*—June 25, 1867.—One end is adapted for transparent objects as in the ordinary instrument, and the other for opaque objects, for the purpose of reproducing designs in a multiplicity of forms for patterns. The object marks in proximity to the object glass are used in designing. The case has receptacles for pictures, which also add to the exterior finish.

Claim.—First, constructing a kaleidoscope that both its ends may be used, as described.

Second, the object glass provided with lines G, substantially as described and for the purpose set forth.

Third, covering the object glass, Fig. 1, with figured paper or fabric, as and for the purpose described.

Fourth, the object glass, Fig. 2, provided with hole D in its covering, to adapt it for use as the eye-glass, substantially as described.

Fifth, the windows E, arranged substantially as and for the purpose set forth.

Sixth, the detached framework carrying the object glass, Fig. 1, as and for the purpose described.

Seventh, as an article of manufacture the design paper adapted for use in conjunction with a kaleidoscope, as herein described and for the purpose set forth.

Eighth, in combination with a kaleidoscope the pictures or designs and slotted receptacles therefor, substantially as described and for the purpose set forth.

66,135.—JONATHAN EMERY, Cedar Falls, Iowa.—*Harvester.*—June 25, 1867.—The cut grain falls upon a laterally traversing carrier, is raised in an inclined direction between the latter and an upper carrier and deposited in a receiver, from whence it is taken by binders who sit in a revolving stand taking the gavels successively and depositing the sheaves upon the ground. The sickle is reciprocated from the main driving wheel by means of a rocking crank shaft and pitman rods, which secure a position to the pitman nearly in a plane with the sickle.

Claim.—First, the flexible swinging curtain H, arranged in the relation to the binders' station and to the endless conveyor G, and endless compressing apron F, substantially as and for the purpose set forth.

Second, the rotating platform K for supporting one or more binders in combination with a receptacle E, into which the cut grain is delivered, substantially as described.

Third, the combination of the rotating binders' station and the endless conveyor G and endless compressing apron F, substantially in the manner and for the purpose described.

Fourth, the arrangement of the gears, chains, and cranks for operating the aprons F G and the sickle Q, directly from the main supporting axle and wheel B B², substantially as shown and described.

Fifth, the arrangement of the pivots of the arms P P on each side of the driving wheel B' and below the axle, in combination with the latch lever *p*, rock shaft *r*, arms *r' v*, and link *u*, arranged and operating as described and shown.

Sixth, a rotating binders' station in combination with a harvester.

66,136.—BENJAMIN F. FARRAR, Springfield, Mass., assignor to himself and D. B. WESSON, same place.—*Safety Railroad Switch.*—June 25, 1867.—The engine approaching on either of the converging tracks acts on the inner one of the two parallel hinged sections to shift the switch into proper connection.

Claim.—A railroad switch so constructed and arranged that if left in a wrong position, the wheels of a passing train will return the rails temporarily to their proper position and the train continue upon the main track, substantially as herein set forth.

66,137.—THOMAS M. and AMBROSE G. FELL, Brooklyn, N. Y., assignors to themselves and WILLIAM BELL, New York, N. Y.—*Manufacture of White Lead.*—June 25, 1867.—Chloride of lead (such as is described in their patent of April 11, 1867) is reduced with soda and water into a thin mass by

stirring. Carbonic acid gas is forced in, forming a bicarbonate of soda, which reacts on the chloride to form carbonate of lead. The chloride of sodium is washed away.

Claim.—The treatment of chloride of lead in the manner and for the purpose substantially as herein described.

66,138.—THOMAS M. and AMBROSE G. FELL, Brooklyn, N. Y., assignors to WILLIAM BELL, New York, N. Y.—*Manufacture of White Lead.*—June 25, 1867.—152 parts sulphate of lead and 100 parts carbonate of baryta are stirred with water to a paste which is heated to 160° Fah., producing sulphate of baryta and liberating carbonic acid, which unites with the lead to form a carbonate.

Claim.—The treatment of salts of lead other than carbonates, and the carbonate of baryta, in the manner and for the purpose substantially as described.

66,139.—THOMAS M. and AMBROSE G. FELL, Brooklyn, N. Y., assignors to themselves and WILLIAM BELL, New York, N. Y.—*Manufacture of White Lead.*—June 25, 1867; antedated April 11, 1867.—Oxide of lead is converted into the chloride by heating or boiling with chloride of sodium, and the resulting chloride of lead is formed into a chloro-sulphate by treating it with sulphuric acid, forming a white product, suitable for use as a pigment.

Claim.—The treatment of chloride of lead in the manner and for the purpose substantially as herein described.

66,140.—THOMAS M. and AMBROSE G. FELL, Brooklyn, N. Y., assignors to themselves and WILLIAM BELL, New York, N. Y.—*Treating Lead Salts for the Manufacture of White Lead.*—June 25, 1867; antedated April 11, 1867.—A hot saturated solution of chloride of sodium or its equivalent is mixed with oxide of lead reduced to the consistency of paste by means of water and heated to the boiling point. The chloride of lead thus formed is washed and is ready for use as a pigment.

Claim.—The treatment of oxide of lead with the chloride of sodium or its equivalent, substantially as described for the purpose of producing a superior chloride or any oxy-chloride of lead.

66,141.—LUTHER W. FELT, Keene, N. H.—*Machine for Cutting Corks.*—June 25, 1867.—The blank is placed on top of the rising post and brought against the cutters, and the lever connected to the post is raised simultaneously, which raises the reciprocating collar and draws in the cutters, whose arms pass through slots in the said collar. When the cork is severed the central rod issues from the post and drives the cork up into the tubular cutter shaft.

Claim.—First, the cutter bars F F, having the stops F' F', in combination with the fixed collar l, the reciprocating collar s', the slots t t, ring s, and clamp g, attached to the rod P, and the beveled projections x x, all constructed and operating substantially as herein described and for the purpose set forth.

Second, the reciprocating rod g, in combination with the levers e and d, for discharging the cork when cut from the cutters, substantially as herein described and set forth.

66,142.—J. B. FOISSIER, New York, N. Y.—*Amalgamator.*—June 25, 1867.—The pulp is poured into the hopper and then falls successively from pan to pan through the whole vertical series, which consists of alternate circular revolving pans attached to the shaft, and annular pans attached to the casing. Each pan is filled with mercury, and beneath each is a stirrer which operates on the one beneath it.

Claim.—First, the arrangement of the circular revolving and annular stationary pans, the same being constructed as described, so that the water containing the ore may fall from top to bottom of the apparatus in a zigzag line, and be thus distributed over the whole surface of the mercury, as set forth.

Second, the stirrers L, when secured to the under side of the pans G and H, and when they are constructed and operate substantially as and for the purpose herein shown and described.

Third, an amalgamator made and operating substantially as herein shown and described.

66,143.—WILLIAM P. FRENCH, Washington, Iowa.—*Band Cutter for Threshing Machine.*—June 25, 1867.—The upper and under rotary cutters are adjustable vertically and longitudinally to suit the size of the sheaf.

Claim.—The double adjustability caused by the means substantially herein set forth.

66,144.—DANIEL GILBERT, Carbondale, Ill.—*Shovel Plow.*—June 25, 1867.—The standard is stepped in the sole bar, and the two are united by an inclined bar which rests in a groove of the share above.

Claim.—First, forming the shovel or plow plate F with a groove or notch in the under side of its upper part to fit upon the bar E, substantially as herein shown and described and for the purpose set forth.

Second, the combination and arrangement of the bar E, with the upright C, and horizontal or ground bar D, substantially as herein shown and described and for the purpose set forth.

66,145.—JOEL E. GILES and CHARLES S. McROBERT, Mead's Mills, Mich.—*Potato Digger.*—June 25, 1867.—The axle is bent into a crank form at each end and so connected to the frame that the latter may be raised by its oscillation, which is accomplished by a lever proceeding upward therefrom, and connected by a chain to the rear bar of the frame. The screen is shaken laterally by connection with the axle.

Claim.—First, the digger H and screen J, constructed substantially as herein shown and described, in combination with each other and with the frame A, as and for the purpose set forth.

Second, the combination of the axle C, lever E, and chain F, with each other and with the frame A, substantially as herein shown and described, for the purpose set forth.

Third, operating the screen J from the drive wheel or wheels D, by means of the bevel gear wheel N, wheel O, shaft P, wheel S, and arm U, substantially as herein shown and described.

66,146.—ANDREW GOODYEAR, Springport, Mich.—*Wood Turning Lathe.*—June 25, 1867.—The roughing cylinder has molding-shaped cutters and rotates in a frame hinged to the lathe bed. The smoothing cutters are on a slide rest and are brought in contact with the hub when the latter is rotating with increased velocity.

Claim.—First, the combination in one machine for turning wagon hubs of the sets of cutters, one set of which may be brought into action for roughing out the hub and a second set then brought into action for the purpose of finishing the hub, the mechanism thereof being constructed and arranged to operate substantially as set forth.

Second, the combination of the yoke from D, hinged to the main frame A, roughening cylinder C, arm a, rod r², spring s, said parts being respectively constructed and arranged substantially as described.

Third, so arranging the operating mechanism of the two sets of cutters that the roughening cutters shall revolve at a high speed at the same time that the hub subjected to its action revolves slowly, and the adjustable finishing cutter fixed upon slides shall act upon the hub when made to revolve at an increased speed, substantially in the manner set forth.

66,147.—CHARLES H. GOULD, New York, N. Y.—*Billiard Cue.*—June 25, 1867.—A nut of hard rubber capped with soft rubber is screwed on the cue.

Claim.—In combination with a billiard cue I, the use or employment of a tip formed of hard and soft rubber, substantially as and for the purpose herein fully described.

66,148.—H. C. HARDY, Muncie, Ind.—*Table.*—June 25, 1867.—When the flap is lifted the weights extend the supporter; the latter may be withdrawn by the crank and cord.

Claim.—The weights D D and the levers e e, in combination with the supporters C C, arranged and operating substantially as and for the purposes herein described.

66,149.—EDWARD S. HARRIS and SYLVANUS S. ROBINSON, Morrison, Ill.—*Apparatus for Drawing and Weighing Liquids.*—June 25, 1867.—The gate of

the faucet is connected to a scale upon which the receiving vessel is placed, so that the falling of the latter, owing to the flow of the liquid, shall close the faucet.

Claim.—First, the faucet A and gate B, when so arranged in combination with one another and with a trigger and other connecting mechanism that the gate shall be closed automatically when the trigger is tripped, substantially as and for the purpose set forth.

Second, the faucet A, gate B, bow C, and spring D, in combination with the trigger E, lever F, stop G, and spring H, arranged to operate substantially as set forth.

66,150.—GEORGE HAVELL, Newark, N. J.—*Bag Hinge.*—June 25, 1867.—The sleeve of the outer leaf is slipped and secured upon the hub of the inner one, and the ends of the jaw frames are secured to them respectively, one shutting within the other.

Claim.—First, the metallic ornamental plate B, having either an opening or stem in its end for connecting it to the bar C, which bar is provided with a cylindrical head *d*, or band, as described, so that when thus connected to the frame A' they form a neat and substantial hinge, as specified.

Second, the bar C and plate B, constructed substantially as herein described and used for the purposes specified.

66,151.—GEORGE HEATH, Little Falls, N. Y.—*Canal Lock.*—June 25, 1867.—The water is admitted to the lower level through valves in front of the gate instead of through gate or passages in the walls. With this improvement the tumble or the swinging gate may be used.

Claim.—The mode substantially as herein described of filling canal locks.

66,152.—JOSEPH HUBBELL, Zanesville, Ohio.—*Head Block for Saw Mills.*—June 25, 1867.—The hand lever is connected to the sliding bar, to which adjustable blocks are affixed. These blocks have inclined slots traversed by the friction rollers attached to the push bars, which are pivoted to the pawls operating the racks.

Claim.—The slotted plates *d d*, made fast on the setting bar *a*, in combination with the friction rollers *i i* on the end of the pushing bars *g g*, the pawl *m* with the rack *h*, constructed, arranged and operating as and for the purposes herein described.

66,153.—JOHN H. IRWIN, Chicago, Ill.—*Apparatus for Carbureting Air.*—June 25, 1867.—Above the lamp chimneys are pipes which conduct heated air to the carbureting chamber above, whence it flows down the central pipe to supply the burners. The two carbureter chambers have heavier and lighter hydro-carbons respectively, the latter being used to start the apparatus and then stopped off.

Claim.—First, the combination of a carbureting device with a chandelier, bracket, or a portable lamp, when arranged and operating substantially as described.

Second, in combination with a chandelier, bracket, or portable lamp, two carbureting vessels to contain two different grades of hydro-carbon oil, substantially as and for the purposes specified.

66,154.—CALEB LEE, Sandy, Ohio, assignor to himself and JOSHUA LEE, same place.—*Harvester.*—June 25, 1867.—The crank shaft rotates in bearings attached to the drag bar, and the latter is jointed on the transverse driving shaft and the brace rod, the latter being jointed on the said driving shaft. These connections allow vertical movement or oscillation in the drag bar.

Claim.—The combination and arrangement of the frame A, drag bar I, having the bearings J J for the crank shaft II, and provided with double joints K, jointed brace L, shoe M, and crank lever N, all constructed and operated in the manner and for the purpose set forth.

66,155.—JOHN T. LEGG, Lewis county, Mo.—*Gang Plow.*—June 25, 1867.—The rear ends of the plow beams and the outer corners of the mold boards are connected to bell crank levers for vertical adjustment. The tongue is hooked to the frame of the plow

beams, and has a strap confining it to the end of a short tongue of the upper frame.

Claim.—First, the plows A A', beams *e e'*, rods F F' and G G', the compound lever H H', lever handles K K', and ratchets M M', arranged, combined and operating for the purpose and in the manner substantially as described.

Second, the lever *n n'* and ratchet *m m'*, arranged, combined and operating for the purpose and in the manner described.

Third, the stay chains P P', the beams E E', the tongue Q, the strap R, and the stiffening pole S, arranged, combined and operating in the manner and for the purpose as heretofore described.

66,156.—KELLOGG H. LOOMIS, Cincinnati, Ohio, assignor to CORNELIUS VAN BRUNT, Fishkill, N. Y.—*Valves of Steam Engine.*—June 25, 1867.—The plug valves are operated by cams on the governor rod, by rods passing through cylinders containing springs, which keep said rods in contact with the cams. The upper cam operating the induction and cut-off valves is adjustably eccentric and conical in form, so that the raising of the rod decreases the throw of the valve.

Claim.—First, the case or seat B, constructed as described, and arranged within a conical opening in its frame, and provided with a tapering plug valve C, said valve being provided with a transverse hub at its center and with longitudinal slots on each side of said hub, the steam openings being uniform at their intersection, but made flaring from this point outwards and inwards, as specified, the whole being arranged as and for the purposes set forth.

Second, the arrangement of the conical spiral cams L and I upon the vertical governor shaft, in combination with the tapering plug valves J' J', for regulating the flow of steam to and from the cylinders in the manner herein specified.

Third, the valve seat B, with central supports *b b* bearing upon the cones *f f*, when arranged in combination with the valve C, in the manner and for the purposes specified.

66,157.—F. LUNKENHEIMER, Cincinnati, Ohio.—*Steam Engine Oil Cup.*—June 25, 1867.—The bolt is attached to the bottom of the cup and the cap of the latter screws on the head of the bolt. Air is admitted by raising the cap; the flow of melted tallow is governed by the stop cock.

Claim.—First, the hand wheel nut and cap formed of the parts marked A A' and A'', arranged and combined substantially as described.

Second, the screw bolt B attached to the bottom of the chamber C, by which the cup and parts attached to the cup are confined, substantially as shown and described.

66,158.—E. C. MALTYB and EDWARD SMITH, Northford, Conn.—*Confection.*—June 25, 1867.—Grated kernel of the cocoa-nut 60 parts is mixed with sugar 20 parts and the composition dried.

Claim.—A new and useful confection, composed of the meat of cocoa-nut prepared in the manner substantially as herein set forth.

66,159.—CHELTON MATHENY, Greensburg, Ind.—*Ditching Machine.*—June 25, 1867.—The earth is taken up in circumferential recess between the sectional rim plates of the wheel, being bound therein by the radial spades which are projected to engage and retracted to free the earth by fixed cams upon the frame. The inclined scraper removes the earth from the recess and deposits it beside the path of the machine. The excavator frame is adjustable on the wheel frame.

Claim.—First, in a ditching machine the revolving excavating wheel D, armed with two circumferential cutters J J' and a series of radial knives F, the latter being automatically advanced and retracted by the cams H and I, as and for the purpose herein described and set forth.

Second, the inclined scraper L l, when used in combination with the wheel D, knives F, cams H I, and cutters J J', for the wheel of the excavated earth in the manner explained.

Third, the pair of revolving cutters or coulters M, operating as described and for the purpose set forth, when used in combination with the aforesaid wheel D J J', knives F, and cams H and I.

Fourth, in combination with the wheel D J J', knives F, and cams H I, the shovel or scoop N, for the object herein explained and set forth.

66,160.—W. W. MAUGHLIN, Baltimore, Md.—*Sash Fastener.*—June 25, 1867.—The latch has an offset underneath the sash bead to bring it to the surface of the casing inside the sash.

Claim.—First, the latch or lever A, provided with the offset c arranged to work underneath the sash bead and in such manner as to avoid the cutting away or defacing of the jamb or casing outside of said bead, substantially as described.

Second, the latch or lever A, provided with the offset c and lugs or clamp a a', arranged and operating as described.

66,161.—HENRY McDONOUGH, New York, N. Y.—*Damper in Steam Boilers.*—June 25, 1867.—The front and rear flues have dampers by which the calorific current may be forced to traverse and re-traverse the tubes of the generator. The dampers are connected together by chains passing through the flues to secure a simultaneous action.

Claim.—The valves D and E, arranged and operating substantially as herein shown and described, in combination with a tubular steam boiler for the purposes specified.

Also, the valves E, opened and closed by means of the weight d and chains a a' operated from the valve D, by the rod G, as herein set forth for the purpose specified.

Also, the partition plate C' in combination with the valves for the purpose set forth.

66,162.—M. MCENERNY, Birmingham, Conn.—*Washing Machine.*—June 25, 1867.—The treadle gives a rotary motion to one disk against which the clothes are pressed by the other disk; the latter is adjusted by the hand lever.

Claim.—First, the combination and arrangement of the vertically arranged plates or disks E E' fitting one within the other, one plate having a lateral adjustment, the other plate having a rotary motion, all substantially as herein shown and described.

Second, the hopper h, in combination with the disk or plate E', for inserting the clothes in the machine, substantially as described.

Third, the soap device constructed as described, consisting of the projecting pocket f in the disk E, cap f', and set screw g, in combination with the disk E', as herein set forth for the purpose specified.

Fourth, the treadle device constructed as described, arranged to operate with the disks E E' and lever F, as herein set forth for the purpose specified.

Fifth, the combination of the lever F with the disk or plate E, substantially as and for the purpose described.

Sixth, the combination of the removable tub K with the disks E E' and the tub A, substantially as and for the purpose herein shown and described.

66,163.—SAMUEL MILLS and J. R. McIRVIN, Clinton, Ill., assignors to JAMES J. ROBINSON, same place.—*Wheelerights' Machine.*—June 25, 1867.—The hub is held to a notch by an adjustable lever arm and the spokes scribed to a circle by a pin on a slide gauge. For dishing, the hub is held between two conical blocks which enter its socket, and the spokes rest in the recess of an arm of the adjustable gauge.

Claim.—The stock A, with the notch c, adjustable arm D, and graduated end b, slide B, provided with pin a and pointer K, arm G, and slotted plate F, arranged to operate substantially as herein set forth for the purpose specified.

66,164.—JOHN D. MUNSON, Tyre, N. Y.—*Sheep Rack.*—June 25, 1867.—The hay rack and grain trough with their supporting frame are so connected that the parts are detachable for stowage or transportation.

Claim.—First, the combination of the pivoted slot frames or racks C and D, with frames A and B, substantially as herein shown and described and for the purposes set forth.

Second, the combination of the division boards or frames E and F, with the frames A and B, of the rack, substantially as herein shown and described and for the purpose set forth.

Third, the combination of the hinged boards G I

and H J, with the frames A and B, and with the division boards or frames E and F, substantially as herein shown and described and for the purpose set forth.

66,165.—J. W. NEAL and W. H. STARTZMAN, Big Lock, Va., assignors by mesne assignments to J. W. NEAL, Big Lock, Va., and HOWARD MUNNICK-HUYSEN, Baltimore, Md.—*Weighing Apparatus.*—June 25, 1867.—The article to be weighed is placed in the scoop which depresses the beam and rotates the shaft connected by belt thereto. The cam is brought in contact with the weighted cord and forces it further from the centre as the weight in the scoop is increased. The indicator finger on the shaft shows the weight upon the dial.

Claim.—The cam lever A, cord E, and weight f, connected to the shaft D, when used in combination with the beam B, and belt C, all the parts being arranged as specified.

66,166.—JOHN F. NEWHALL, Waltham, Mass.—*Needle Case.*—June 25, 1867.—The needles are stuck on a ribbon which winds on a shaft within the casing.

Claim.—The needle case constructed as described, consisting of the slotted cylindrical case B, in which the spindle D, is pivoted, whose outer end is provided with the conical knob E, the needle flannel F, and strip G, as herein set forth.

66,167.—JAMES M. NOBLE, Delhi, Iowa.—*Washing Machine.*—June 25, 1867.—The suds box rocks on rollers and the beater slips back and forth on the false bottom. Chambers beneath the bottom alternately receive and deliver water.

Claim.—First, the construction of the beater box B, containing the false bottom D, over which gravitating beater F, slides substantially as described, for the purpose specified.

Second, the combination and arrangement of the beater box B, false bottom D, beater F, and double water receptacle E, as herein set forth for the purpose specified.

66,168.—ALBERT OBER, Beverly, Mass., assignor to himself, JOHN T. OBER and SAMUEL F. OBER, same place.—*Toilet Glass.*—June 25, 1867.—The upper glass is supported by hinged sections in position to reflect a view of the back hair upon the glass placed in front of the person.

Claim.—The two mirrors H I, in combination with the series of folding frames C D E F, and when necessary the supporting frame G, hinging to the series of folding frames and attached to a box A, or any suitable base, all arranged substantially as and for the purpose set forth.

66,169.—H. W. PARSONS and L. L. WOOSTER, Whitney's Point, N. Y.—*Attachment for Spading Forks and Shovels.*—June 25, 1867.—The loop is used as a fulcrum in lifting the soil, and the handle is then rotated to deposit the spadeful of earth.

Claim.—The loop D, and the pin and collar C, with the spade or fork, as and for the purpose specified.

66,170.—HUDLESON PATTERSON, Augusta, Mich.—*Track Raiser for Railways.*—June 25, 1867.—The foot is placed on the foundation beneath the rail, and the sliding plate raised with the rail by the rotation of the screw.

Claim.—The arrangement of the pointed sliding shoe F, upon the end of the screw D, between the uprights A A, having a curved base C, and used for elevating railroad tracks in the manner as specified.

66,171.—J. B. POWELL and S. H. EVERETT, Macedon, N. Y.—*Gate.*—June 25, 1867.—A pinion attached to the bent pintle of the gate is rotated by the oscillation of the segment rack which is pivoted on the top of the post and moved by rods within reach of a traveler, without dismounting.

Claim.—The combination of the pivoting rod C, having a crank formed upon its upper part, and a pinion wheel c', attached to its upper end, the toothed and pivoted plate D, connecting rods G, and operating levers H, with each other, with the gate A, and posts B and F, substantially as herein shown and described and for the purpose set forth.

66,172.—ADRIAN RAISE, Waterbury, Conn., assignor to SCOVILLE MANUFACTURING COMPANY, same place.—*Machine for making Butt Hinges*.—June 25, 1867.—A single bending die is connected with co-operative machinery, and the blanks automatically and consecutively delivered by a hopper to the front of the die. The blank is first pressed on the edge to turn it up, and then by another movement the turn is continued until the knuckle is completed.

Claim.—The combination of the single bending die, the clamping gauge, the cams, the rock shafts and their arms, the pitman, the feeding apparatus, and the pushing slides, or the equivalents of them or either of them, the said combination being organized substantially as described.

66,173.—THOMAS S. ROBINSON, New York, N. Y.—*Handle Attachment for Blacking Boxes*.—June 25, 1867.—A handle of sheet metal is so pivoted to the bottom that it can be turned under the box or project therefrom.

Claim.—The handle B, pivoted at C, to the bottom *a*, or top b, when constructed, arranged, and operating as herein set forth.

66,174.—EDWARD H. ROE, Jersey City, N. J.—*Hand-saw*.—June 25, 1867.—The pressure of the screw on the back of the blade strains it and removes lateral kinks from the edge.

Claim.—The application of a screw or its equivalent to a back saw, substantially in the manner and for the purpose set forth.

66,175.—FRANCIS JOSEPH SCHELLMANN, Syracuse, N. Y., assignor to himself and THEODORE THURBER, Auburn, N. Y.—*Sad Iron Handle*.—June 25, 1867.—The wooden handle having a deflecting plate to protect the hand, and a spring catch for attachment, is thrust on the horizontal backwardly projecting pin of the handle stem.

Claim.—First, the shank A, as constructed in combination with the spring catch *a*, to hold the handle D on, and allow it to be easily removed for heating, substantially as and for the purpose herein set forth.

Second, the turned handle D, spring catch *a*, shield E, and shank C, as herein described, in combination with a flat or sad iron, substantially as set forth.

66,176.—JUDSON SCHULTZ, Ellenville, N. Y.—*Machine for Unhairing Hides*.—June 25, 1867.—Explained by the claims and illustration.

Claim.—First, the combination of the apron or belt E, wound upon or passing around the rollers G and H, with the knife cylinder B, substantially as herein shown and described, for the purpose set forth.

Second, the combination of the ratchet I, pawl J, pawl lever K, and rack L, with the journals of the apron or belt rollers G and H, for the purpose of holding or tightening the belt or apron F, and shifting its position, substantially as herein shown and described.

Third, arranging the apron or belt F, the knife cylinder B, and feed rollers D and E, with each other, substantially in the manner herein shown and described, so that the hides or leather may be fed to the knife cylinder B, in which the said knife cylinder is moving.

Fourth, arranging the gearing N O P R in the manner herein shown and described, so that the feed rollers D and E may be driven at a less velocity than the knife cylinder B, as and for the purpose herein set forth.

66,177.—JOHN V. H. SECOR, New York, N. Y., assignor to himself and JAMES D. SECOR, same place.—*Wrench*.—June 25, 1865.—The shank has ratchet teeth, presented in different directions. The socket of the movable jaw is oblique, and it is tipped by the spring to engage its edges with the ratchet teeth to fasten it in position; screws in the cheeks of the jaw traverse slots in the sides of the shank.

Claim.—The sliding jaw D, provided with the inclined or oblique opening *a*, and having the spring E attached, and the screws F passing through the sides of the jaw into the grooves *f*, in the sides of the shank A, in combination with the racks *e e*, in the rear and front sides of the shank, substantially as and for the purposes set forth.

66,178.—HENRY SIDLE, Minneapolis, Minn.—*Churn*.—June 25, 1867.—The radial arms of the dasher are triangular in section. The dasher is oscillated by a bevel segmental rack actuated by a lever, which engages a bevel pinion on the shaft.

Claim.—The arrangement of the box A, provided with ribs on its inner side, dasher B, with its arms C C, as constructed, supports D D, with wheel F and vertical handle H, for operating cog G on end of dasher shaft, in the manner and for the purposes specified.

66,179.—HENRY T. SMITH, Brooklyn, N. Y.—*Step Ladder*.—June 25, 1867.—The extension parts are connected by straps to the ordinary parts, and are sustained to any adjustment by traverse pins.

Claim.—The combination of the extension parts G and J and guide straps H I K L with the ordinary parts A and B of a step ladder, substantially in the manner herein shown and described, and for the purpose set forth.

66,180.—JOEL J. SMITH, Barnesville, Ohio.—*Sheep Feeding Rack*.—June 25, 1867.—The bottom boards are pivoted, and are upset to discharge offal. The troughs may be raised out of reach of the sheep. The pivoted boards above may be arranged to direct the feed centrally or to divide it to the troughs.

Claim.—First, the pivoted bottom B B, in combination with a sheep rack, in manner substantially as and for the purposes described.

Second, the combination of the rack and adjustable troughs, in manner substantially as herein shown and described.

Third, the troughs C, adjustable by the bell cranks and lever arrangements, in manner and operating substantially as above set forth and described.

Fourth; the pivoted shield H, in combination with troughs C, in manner and operating substantially as and for the purposes described.

66,181.—L. SMITH, Strongsville, Ohio.—*Washing Machine*.—June 25, 1867.—A series of beaters, grooved at the end, are connected to a compound crank shaft, and reciprocate on the inclined bottom. The beaters may be thrown back out of the sub-box when desired.

Claim.—First, the series of beaters B, as arranged in relation to the spring-board G, rib H, and springs J, in combination with the inclined bottom, and operating conjointly, substantially as and for the purpose set forth.

Second, the elastic cushion Q and block P, arranged in relation to the links D and spring M and crank, and applied as and for the purpose set forth.

66,182.—LUCIEN B. SMITH, Kent, Ohio.—*Wire Fence*.—June 25, 1867.—The hubs are armed with points, and are sleeved upon the wires. They are prevented from slipping out of place by the short bends in the wire.

Claim.—The construction of a wire fence provided with rotary spools *e e*, having radial spurs *d d*, and supported by cast-iron posts A, arranged as and for the purpose described.

66,183.—DANIEL B. SPENNING, Brooklyn, N. Y.—*Fruit and Poultry Box*.—June 25, 1867.—The sides, top, and ends of the box are secured by staples, eyes, and hooks, to contain fruit, &c., and the parts fold upon each other for transportation.

Claim.—First, the manner of connecting the cover to the back C' of the box by means of staples *e e* and slotted plates *g g*, substantially as herein shown and described.

Second, a folding box, when made of the pieces A B B C C' D and E, all being hinged, connected, and fastened substantially in the manner herein shown and described.

66,184.—CALEB S. STEARNS, Marlboro', Mass., assignor to himself and W. E. C. WORCESTER, same place.—*Machine for Trimming Heels of Boots and Shoes*.—June 25, 1867.—The rotating table has upright frames, each having bearings for a plate carrying the heel, which rotates in contrary direction to the knife. The heel is unclamped automatically, to admit of removal when carried back from the knife.

Claim.—The revolving table F, with its swinging

frames T, operated by mechanism substantially as described for traversing the heels to and from the knife, and for holding them in position while being trimmed, substantially as set forth.

Also, the shafts E, with their gears D, revolved by the toothed portions *b b'* of the annular ring C, in combination with the pins *s s*, and their plates U V, or other suitable mechanism for producing the required revolution of the heels, substantially in the manner set forth.

Also, the incline 10, for raising the plates U, which support the heels for the purpose of holding them firmly in position between said plates U and yielding pressure plates V, substantially as set forth.

66,185.—R. H. ST. JOHN, Bellefontaine, Ohio, assignor to J. W. RUSSELL and D. S. COVERT, New York City.—*Marking Attachment for Sewing Machines.*—June 25, 1867.—The marker is attached to the presser foot, and is operated by the needle bar, which in its descent strikes against the dog, which marks the cloth in a line parallel with the stitches.

Claim.—The spindle E, having dog or foot piece K, marker H, spring M, screw J, holder B, and presser foot A, when constructed and arranged as herein set forth for the purpose specified.

66,186.—JAMES F. SWINNERTON, Marion, Ohio. *Horse Rake.*—June 25, 1867.—The machine is steadied and controlled by handles attached to the rear of the shaft; the draft is applied to the hook and pivoting pin jointly. The hay is collected on the rack and drawn thereon to the stack.

Claim.—The combination of the plate or socket L, hook M, and ring N with each other and with the tongue K and frame F G, substantially as herein shown and described and for the purpose set forth.

66,187.—CHARLES M. TANNER, Mentor, Ohio.—*Extension Scaffold.*—June 25, 1867.—After the platform has been raised by the ropes of the lower windlass, the upper one is drawn tight to steady it. The hinged side-frames are swung out 90° to act as braces.

Claim.—First, the windlass A, guy ropes A' and A², in combination with the platform H, operating substantially as and for the purpose specified.

Second, the swing braces D¹, hinged to and in combination with the main frame, as described, and operating as and for the purpose set forth.

66,188.—H. S. TOWNSEND, Greenvale, Ill.—*Seed and Grain Sieve.*—June 25, 1867.—The sieve is supported by longitudinal wires beneath and extends beyond the end of the casing; an inclined board beneath the sieve returns the grain and directs it on to the usual grain board.

Claim.—First, extending the screen D of a grain or seed separator or threshing machine beyond the ordinary grain shoe; and supporting its outer end by an additional shoe E, substantially as and for the purpose herein shown and described.

Second, the application of the wire braces *c c* below the netting of a wire screen D, for the purposes set forth, and substantially as herein shown and described.

66,189.—EBENEZER TUTTLE, Canaan, Me.—*Water Wheel.*—June 25, 1867.—The wheel rotates in a horizontal plane and discharges outwardly. The gate slides vertically, rotates with the wheel, and has a series of horizontal projections on its lower edge, which enter spaces between the brackets to adjust the capacity of the wheel. Water is admitted below a circular disk beneath the seat of the wheel to support the latter.

Claim.—The regulator C and disk D, arranged in relation to the gate G and wheel A, substantially as and for the purpose set forth and described.

66,190.—JOHN VANDERCAR, Brooklyn, N. Y., assignor to T. S. SPERRY, same place.—*Feed Bag.*—June 25, 1867; antedated June 20, 1867.—Between the wooden bottom and the cloth top is an intervening section of wire gauze. The edge of the cloth top is folded down inside and furnished with a rubber drawing.

Claim.—The internal bag E, extending downward and inward from the top of the structure, and provided with the spring *e*, arranged to operate relatively

to the internal bag E, and to the perforated exterior casing B, substantially as and for the purpose herein set forth.

66,190.—JOSEPH WALL, New York, N. Y.—*Signal Lamp.*—June 25, 1867.—The box has a disk, which rests on a similar disk of the stand. The disks are perforated near the periphery with vertical holes, a pin entering the holes to fix the box to any adjustment in a horizontal plane. The annular cases around the lamps have sections of different colored glasses for signaling.

Claim.—The box A, having cases B fitted in it, provided with different colored glasses *a b c* and an opaque or dark section *d*, and enclosing lamps or lights, the cases being placed before openings in the box, and all arranged substantially as and for the purpose specified.

Also, the placing of the box A on a revolving stand, constructed and arranged substantially as and for the purpose set forth.

66,192.—W. WALLICK, Philadelphia, Pa., assignor to himself, S. F. PRINCE, and H. K. SMITH, same place.—*Machine for Feeding Nail Plates.*—June 25, 1867.—The plates are automatically withdrawn from the receptacle and fed to the machine. The devices are cited in the claims.

Claim.—First, the nippers L, constructed substantially as described, in combination with the devices herein set forth, or the equivalent to the same, whereby the reversing and reciprocating and vertical vibrating motion are imparted to the said nippers, as and for the purpose herein set forth.

Second, the said nippers L, having the above specified movements, in combination with a bed plate F, by which the nippers are carried, and with the devices herein described, or their equivalents, by which the said bed plate and its nippers are advanced at uniform intervals, for the purpose described.

Third, the recessed brackets S S, or their equivalents, for holding the strips to be converted into nails, in combination with the sliding frame T and its shoulder and the mechanism described, or its equivalent, for operating the frame and causing the latter to move the lowest of the strips within the range of the nippers, as set forth.

Fourth, the nippers, constructed substantially as described and connected to the spindle J, in combination with the cam-like plate P, hung to the said spindle and operated by the moving bed plate through the mechanism described, or its equivalent, so that the said plate P may open the jaws of the nippers and permit the same to be self-closed, in the manner and for the purpose specified.

Fifth, the segmental pulley I, carried by the moving bed F, and arranged to operate the spindle J through the medium of straps *q* and *q'*, or their equivalents, in combination with the vibrating plate H and its pointed projection.

66,193.—NORMAN W. WHEELER, Brooklyn, N. Y.—*Flexible Coupling.*—June 25, 1867.—A modification of the gimbal joint, in which the wear of the parts is compensated for by a means of taking up the lost motion; the abutting faces of the semi-circular clamps being filed and refitted to bring the chock pieces against the trunnions.

Claim.—First, the combination of the coupling heads B B, chock pieces *f f f f*, and clamp ring D D, substantially as and for the purposes described.

Second, in combination with the above, dividing and constructing the chock pieces *f f f f* and *f² f² f²*, substantially as and for the purpose described.

66,194.—NORMAN W. WHEELER, Brooklyn, N. Y.—*Surface Condenser.*—June 25, 1867.—The pressure of the water in the annular space withdraws the plunger against the pressure of its spring and opens an annular orifice in the nozzle, through which the cold water is ejected against the condensing surface.

Claim.—The combination of the above described discharge nozzle with a surface condenser.

66,195.—HIRAM M. WHITE, Olney, Ill.—*Washing Machine.*—June 25, 1867.—Hooks on the frame of the machine engage staples in the sides of the tub. The pressure on the upper roll is adjusted by the screw bolt, whose head bears upon the spring.

Claim.—First, the roller washing machine B C D F, provided with attaching devices to secure it within a common wash tub, substantially as described.

Second, in connection with the above, the pressure device F G H J, in combination with the rolls D and frame B V, as and for the purpose specified.

66,196.—AUGUSTUS WILLIAMS, Sebec, Me.—*Planting Hoe.*—June 25, 1867.—On the back of the blade is a box, from which the seed is discharged when the trigger is pulled.

Claim.—A planting hoe, composed of the parts herein shown and described, when combined and arranged to operate substantially as and for the purposes set forth.

66,197.—F. A. WILLIAMS, Cloverville, N. Y.—*Supporter for Elevated Railways.*—June 25, 1867.—The sleepers are supported on a row of central columns, each of which is founded on a base piece; side supports of wrought iron are also planted in the base piece, and branching above are notched into the sleeper to sustain it.

Claim.—The construction of the posts A, consisting of a combination of the bed plate D, central post C, side supports E, and braces F with the sleeper B, all made substantially as and for the purpose herein shown and described.

66,198.—CORNELIUS L. WILLIS, Washington, D. C.—*Door Stop and Latch.*—June 25, 1867.—The edge of the door passes the spring catch and impinges against the yielding stop. The latter is a pin projected by a spiral spring.

Claim.—The yielding stop, as constructed, in combination with a spring catch or hook, operating in the manner substantially as herein described, for the purpose set forth.

66,199.—WILLIAM V. V. WILSON, Savannah, Ga.—*Pill Machine.*—June 25, 1867; antedated June 21, 1867.—The side bars of the frame which form tracks for the rubber board are vertically adjustable, so as to determine the distance apart of the corrugated faces.

Claim.—The adjustable rails C, in combination with the board A and rubber B, substantially as and for the purpose described.

66,200.—ISRAEL WING, Earlville, Iowa.—*Sulky Plow.*—June 25, 1867.—The beams project forward to form the tongue, and are hinged to the axletree. The inner standards are carried up in form of handles, their attachment allowing of movement by the operator.

Claim.—First, the combination of the inclined tongues C with each other, with the double tree D and axle B, substantially in the manner herein shown and described and for the purpose set forth.

Second, the combination of the plow standards G and H, bars I and chains K with each other and with the tongues C, substantially in the manner herein shown and described and for the purpose set forth.

66,201.—C. W. STAFFORD, Saybrook, Conn.—*Pavement.*—June 25, 1867; antedated March 27, 1867.—The blocks have gains on their vertical faces, which are occupied by wooden keys and a number of associated blocks and banded together by an iron strap.

Claim.—First, the constructing of sections of pavement, composed of metallic bands, grooved blocks of wood and keys, substantially as and for the purpose set forth and described.

Second, a pavement made up of sections of wooden blocks, substantially as described for the purpose specified.

66,202.—HENRY VALENTINE SCATTERGOOD, Albany, N. Y.—*Cotton Gin.*—June 25, 1867.—The teeth are needle-pointed, and set obliquely to the radial lines of the ginning cylinder, which is composed of segments of rings, which admit of separate removal. The cotton is doffed by a brush cylinder, and received by and condensed between two smooth cylinders, which make it into a bat, and allow the dust to pass off.

Claim.—First, a ginning cylinder, formed with circular ribs or projections, containing or supporting the teeth, said ribs or projections being elevated above the other portion of the surface of the ginning cylinder, and thus leaving grooves for the reception of the guards, substantially as specified.

Second, forming the ginning cylinder of a series of rings, between which rings or segment of rings containing teeth are secured, substantially as specified.

Third, in combination with a cylinder carrying circular ranges of needle-pointed teeth, the guards R, formed with openings to their upper ends, as and for the purposes specified.

Fourth, attaching the delivering or doffing roller upon arms extending from the axis of the perforated condensing roller or cylinder, so that said delivery roller is allowed to raise and accommodate the thickness of the bat, and is kept properly in contact with the condensing cylinder as set forth.

Fifth, in combination with the condensing roller or rollers, formed with smooth perforated surfaces, the screen V and brush blower B for conveying the cotton to the condenser, as specified.
